York.—November 2nd. N.E. Railway. Telegraph stores for six and twelve months. See "Official Notices" Oct. 26th.

CLOSED.

Bradford.—Electricity Committee. Portable wagon and truck loader for handling stock coal at Valley Road power station: Goodall, Clayton & Co., Ltd., Leeds. 12,000-KW. turbo-generator, £45,775; Parsons & Co., Ltd.: the Committee has authority to order a condenser for same.

East Ham.—Town Council. Accepted tender:—

Edison Accumulators, Ltd.—Six electrically-propelled dust-vans, at £1,121 each, and one automatic electric filler, at £2 10s.

Ilford.—U.D.C. Accepted tenders:—

General Electric Co., Ltd.—D.C. switchboard for sub-station, £286; E.H.T. switchgear, £174; additional equipment for switchboard, £72. Herbert Morris, Ltd.—7½-ton overhead travelling crane and rails, £106.

FORTHCOMING EVENTS.

Salford Technical and Engineering Association.—Saturday, November 3rd. At 7 p.m. At the Royal Technical Institute, Peel Park. Members' short papers for gold medal given by Mr. W. O. Larnmeth.

Chief Technical Assistants' Association.—Saturday, November 3rd. At 3 p.m. At the Tavistock Hotel, London. Ordinary meeting.

Roentgen Society.—Tuesday, November 6th. At 8.15 p.m. At the Royal Society of Arts, John Street, Adelphi, W.C. Presidential address.

Institution of Civil Engineers.—Tuesday, November 6th. At 5.30 p.m. At Great George Street, Westminster, S.W. Presidential address and presentation of medals.

Faraday Society.—Wednesday, November 7th. At 5.30 and 8.30 p.m. At the Royal Society of Arts, John Street, Adelphi, W. Discussion on "Pyrometers and Pyrometry."

Institution of Electrical Engineers.—Thursday, November 8th. At 6 p.m. At the Institution of Civil Engineers, Great George Street, S.W. Inaugural address by the president, Mr. C. H. Wordingham, and presentation of premiums.

NOTES.

Volunteer Notes.—COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).—Headquarters, Balderton Street, Oxford Street, W. 1.

Orders for the week, by Lieut.-Colonel C.B. Clay, V.D., commanding:—
Officer for the Week.—Second Lieut. P. Bowden.
Next for Duty.—Second Lieut. E. A. Ullmann.
Drills.—Week ending Saturday, November 10th, 1917:—
 Monday.—No. 3 Company, Left Half. Recruits, signalling, 6.30.
 Tuesday.—Physical drill and bayonet exercise, 7.30.
 Wednesday.—No. 1 Company, 6.30.
 Thursday.—No. 2 Company, 6; signalling, ambulance, 6.30.
 Friday.—No. 3 Company, Right Half. Recruits, 6.30.
 Saturday.—Commandant's Parade for Route March and Drill. Parade Headquarters, 2.45. Uniform. Compulsory for A, B, and C men.
 Musketry.—Belvedere Road. Tuesday, Wednesday, and Thursday, 5.30 to 7.
 Note.—The Medical Officer will attend for examination of recruits, &c., on Thursday, at 6.
 An inspection of all A, B, and C men has been arranged for Saturday, November 17th. Full particulars in next week's orders.

(By order) MACLEOD YEARSLEY, Capt. and Adjutant.

Employers' Organisation.—The *Daily Chronicle* states that an agreement which has just been reached between some of the larger Employers' Associations will shortly crystallise into a permanent organisation with large powers. The Associations which have already signified general approval of the scheme include the National Employers' Federation, the Engineering and Shipbuilding Federations, the Federation of British Industries, and the Sheet-Metal Workers. The root idea is to establish a central authority which will constantly review the conditions of work and wages without an extension of the principle of State intervention, and will have the power to make agreements with the labour organisation for whole areas and whole industries.

Dangerous Mischief.—At the Saddleworth Police Court, last week, a 16-year old boy named James Whitehead, who was stated to be earning 30s. per week, was ordered to pay £1 damage and 15s. 6d. fine for fusing an electric fitting at the Gatehead Mill, Delph, where he was employed. After inciting another lad to mischief, the defendant applied a bit of wire to an electric light fitting, protecting himself from shock by using woollen waste. The result was the fusing of the wire, a burst of flame, and the extinction of many lights. There was danger both of the destruction of the mill by fire and of injury or loss of life by the panic which might have resulted from the sudden darkness. The proceedings were taken as a warning, there having been a succession of these mischievous acts. The shed was a new one, costing £20,000, and the firm had had a destructive fire in 1915, which might have originated in some such way.

Educational.—BLACKPOOL.—The Education Committee has refused to accede to a request to commence classes in Blackpool on electrical subjects, though it was stated that a satisfactory number of students would be forthcoming. In explaining the refusal, the chairman of the Higher Education Committee stated, on Tuesday, that if the class was held there would have to be other classes in physics and practical mathematics, and provision would have to be made for a suitable amount of machinery and apparatus. In view of the expense and the probable small number of students, the Committee did not think the present was an opportune time to start such classes. Commenting on this decision, a local contemporary remarks: "Surely this is not the new spirit which is going to do such great things educationally in England."

BRISTOL UNIVERSITY.—Mr. Henry H. Wills has presented to the University of Bristol, property covering nine acres adjoining the present site of the university buildings, for future extensions.

Electric Lamp Stealing from Trains.—A 14-year old boy, of Ashton-on-Mersey, was fined 45s. at the Manchester County Police Court, on Monday, for wilfully removing and breaking an electric bulb in a third-class compartment on the Manchester, South Junction and Altrincham Railway, whilst passing through a tunnel at Old Trafford. An inspector of the Great Central Railway police stated that 500 lamps had been stolen from railway carriages during the last six months, and 70 bulbs that had been missed had not been replaced, on account of shortage.

Industrial Combination.—The speeches which were delivered by Mr. Paish and Mr. C. Hamilton Wickes before the Birmingham Brass Masters, urging them to co-operate and combine in readiness for after the war, have been followed by another along the same lines but in greater detail delivered in the same city by Sir W. Ashley. In this case the audience consisted of the Federation of British Industries and the National Union of Manufacturers. Sir W. Ashley showed that it was in the national interest that there should be far more combination between manufacturers within the several trades. In the past combinations had broken down because their object had been to maintain prices without effecting economies in production. This put a premium on unprogressive equipment and incompetent management. The combination that would be approved by the public, and would extend its hold upon the world's markets, would be one which combined a reasonable profit to the manufacturers with reasonable cheapness to the consumer. Under modern conditions these ends could only be achieved by the introduction of specialisation rendering possible the continuous employment for each process of the most suitable machinery. Each trade must settle for itself how this should be carried out. The necessity, however, must be recognised, and it must also be seen that the carrying out of the principle of combination involved some amount of restraint on the present freedom of business concerns. Referring to unemployment

questions, he stated that the root cause of the instability of employment was the inability of uncombined manufacturers to stabilise production. There was still far too wide a range of manufacture where a single obstinate concern was able to upset or disregard a trade agreement to which the great bulk of the industry concerned had consented. Out-of-date individualism caused social mischief. If the manufacturers in a trade could not manage to make wage agreements binding on competing concerns, the State would have to enforce such agreements. In regard to the question of industrial training, every trade ought to be able to provide for itself the amount of skilled labour that it required. This could be done by concerted action. The difficulties of industrial reconstruction called for a sufficient knowledge of facts and statistics, in order that they might be properly handled. Where employers and employed were properly organised, and through properly organised trade combinations, such material could be easily obtained.

Inquiries.—A correspondent wants a vacuum oven to take armatures up to 3 ft. 6 in. in diameter, or suggestions as to the cheap construction of one. Makers of the "Elco" recorder are asked for.

Appointments Vacant.—Mains superintendent, also meter tester and erector, for the Kettering U.D.C. electricity works. Newport Corporation wants an installation inspector, a mains foreman, E.H.T. jointers, and wiremen. See our advertisement pages to-day.

Reconstruction.—The November issue of the *World's Work* contains a lengthy article on the "Reconstruction of Prosperity," by Dr. G. B. Hunter, chairman of Messrs. Swan, Hunter & Wigham Richardson. The writer describes, in a most interesting way, the steps that, in his opinion, are necessary for the reparation of the wastage of war and the restoration of our commercial prosperity.

British Standards for Electrical Machinery.—We have received from the British Engineering Standards Committee a copy of the new edition of the "British Standardisation Rules for Electrical Machinery (excluding Motors for Traction Purposes)," being Report No. 72-1917 of the Committee. The first issue of this Report was made in October, 1915, and special attention is directed to the new form in which these rules appear. In line with all new and revised Specifications and Reports issued by the British Engineering Standards Committee, this publication is octavo size, and is issued at the uniform price of 1s. net. French, Italian, and Spanish translations of this Report will be available shortly. The Committee is particularly anxious that the issue of its publications at the flat rate of 1s. should become as widely known as possible, for it is hoped that this will lead to their very extensive dissemination amongst engineers, managers, designers, draughtsmen, foremen, and, in fact, all those engaged in the engineering and allied industries. The principal modifications introduced during this revision of the rules are as follows:—

The permission to use the thermometer method of measuring the observable temperature of continuous-current shunt-wound stationary field coils, provided the maker can show that if the resistance method had been employed the limits of observable temperature and observable temperature rise permitted by the rules would not have been exceeded. (Clause 68.) The thermometer method is in this case penalised with a 5° C. reduction in the permissible temperature limits. (Clause 67.)

In the first edition of these rules the use of embedded temperature detectors was permitted for large machines, but in the present rules measurements made with embedded temperature detectors are no longer to be considered as an essential part of the acceptance tests.

The excess-current tests have been reduced in the case of machines for continuous service from 100 per cent. to 50 per cent. (Clause 79.)

A few alterations have been made to the high-pressure tests, and a clause has been added dealing with the application of a high-pressure test to a machine which has been out of service for some time and to which it is desired to apply a high-pressure test to ensure that the insulation should be in sound working condition before the machine is put back into service. In this case it is stated that the test pressure should be 75 per cent. of the test pressure required in the case of a new machine.

The rules have been re-arranged, and an introduction, the object of which is to explain briefly how the rules should be used, has been included.

Wages of Electrical Wiremen.—The General Purposes Committee of the L.C.C. recommends that the Council's list of wages and hours be amended by the addition of the following:—"That from and including July 1st, 1917, the agreed rate for wiremen in the electrical trade has been advanced to 1s. 2d. an hour and for assistants to 11d. an hour."

Electrical Instruction at Barcelona University.—Under the title Instituto de Industrias Electricas, a school of electrical engineering has lately been established in Barcelona, in connection with the University of that city.

Society for Electrical Development (U.S.A.).—There will be no national "electrical week" celebration this year, owing to war conditions: it has been decided to hold it next year, and there is a strong feeling in favour of the time being changed from the autumn to the spring season. A special electrical campaign, however, will be conducted in the form of "a big drive for Christmas appliance business," the idea being to encourage the purchase of electrical appliances for Christmas presents.

Stolen Club Funds.—At the Manchester County Police Court, on Monday, Albert Robertson Stark (42) was sent to prison for six months, with hard labour, for stealing the sum of £231 5s. 6d. in July last. It was stated that the prisoner was employed at the Lancashire Dynamo & Motor Co.'s works, Trafford Park, Manchester, as a costs clerk, and he had acted as treasurer of the works' holiday saving club, which was carried on by the employés. When the books were examined on August 3rd, it was found that there was a deficiency of £108, but later it was found to reach the figure mentioned above. At that time the man was missing, and he was arrested on Saturday night through an employé from the works visiting a suburban theatre and recognising the prisoner, who was performing under an assumed name, by his voice.

Institution and Lecture Notes.—Diesel Engine Users' Association.—At the October meeting, after the election of a further list of members, a proposed amendment of the Standard Policy of Insurance of Diesel Engines against Breakdown was considered, and arrangements were made under which differences arising between the underwriters and the policy holders as to the interpretation of the policy may be submitted for decision to a special committee appointed by the Association.

The president, MR. GEOFFREY PORTER, reported on the position in regard to the supply of tar oils as Diesel engine fuel to members of the Association, as discussed with the Director of Munitions Petroleum Supplies. In the discussion which followed, the difficulty of making satisfactory arrangements for continuous supplies of fuel for the short periods allowed for by the licences issued by the Director of Munitions Petroleum Supplies was referred to. Attention was drawn to the point that the action of the Association in encouraging the use of tar oils as fuel in Diesel engines should be of advantage in the national interest in stimulating the economical use of the country's coal reserves and in permitting of the extraction of valuable products from the coal, several of which are of especial importance to the country in present circumstances. As an example, the Hon. Secretary produced the figures of the Diesel engine plant at Chelsea, in which case the consumption of 700 tons of fuel oil per annum resulted in the replacement of a total weight of 6,000 tons of coal per annum which would otherwise have had to be transported by the railways, and which would have produced about 500 tons of clinker and ashes for which cartage facilities would have had to be provided.

MR. H. S. RUSSELL read a paper on "Automatic Control of Blast Pressure for Diesel Engines," in which he described the construction and working of Messrs. Mirreles, Bickerton & Day's apparatus for regulating the blast. Among the advantages claimed for the apparatus are smoother running of the engine, saving in fuel, less attendance on the engine, improvement in the condition of exhaust valves, and the replacement of the blast bottle by a small separator.

Textile Congress.—At the annual meeting of the Textile Institute recently held at Preston, a paper was read by Dr. J. F. Crowley on "Science as a Factor in the Development of the Textile Industry," in the course of which he pointed out the need for co-ordination between the textile machinist and the power engineer. Much of the present-day machinery was designed when main line shafting speeds were 40 r.p.m. or less, and though such speeds have considerably increased they are still below the most suitable from the electrical point of view. Individual electric driving has been the most significant advance in textile machine driving of recent years, but the best results can only be obtained if modifications are made in the driven machines, and such modifications can only be made if the textile machinist and power engineer act in close co-operation.

As showing in a broad way the possibilities in the application of electricity to the industry, it may be noted that only 5 per cent. of the power required by textile factories in this country is obtained from electricity generated in the factories themselves and only one-half of 1 per cent. from electricity purchased from outside supply undertakings, and this although the textile industries furnish nearly one-fifth of the total power load of the United Kingdom.

On the question of labour, Dr. Crowley says it is easy to show that a high net output per operative and a high horse-power per operative are invariably associated with high wages. Statistics for the cotton trade in 1833 and the Census of Production (1917) give the following figures:—

	1833.	1907.
H.P. per operative	709	216
Net output per operative per annum ...	£175	£79
Wages per operative per annum ...	£214	48

In the period under review, nearly three-quarters of a century, the H.P. per operative has increased 24 times, and the net output of the individual by 66 per cent., while wages have increased by 121 per cent.

As regards the question of research work, Dr. Crowley contends that "industrial" research has been much neglected.

The necessity for developing industrial research, made apparent when war broke out, led to the formation of an Advisory Council on Research on which, however, all the members but one are fellows of the Royal Society—membership of which is the blue ribbon of the pure scientist; the sole exception is referred to as the "administrative chairman." Dr. Crowley considers that it was evidently the intention of the Privy Council that this Council should consist not only of eminent scientific men but also of men actually engaged in industries dependent upon scientific research.

Every step taken by the Council for Research thus far seems to indicate the intention of maintaining an over-riding position for the pure scientist, and the standing committees already formed show what a large percentage of these bodies is nominated by a largely academic Council.

Reputations in pure science are frequently built up in extremely limited spheres of work, and the whole atmosphere of academic work is fatal to that broad outlook and grasp of the tendency of industrial development so essential in deciding on types of research to encourage.

Institution of Electrical Engineers. The first meeting of the Institution for the session is to be held on Thursday next at 6 o'clock (light refreshments at 5.30 p.m.), when Mr. Worthingham will deliver his presidential address. Other arrangements for the session are as follows:—

November 22nd.—"Gas Firing Boilers," by Mr. T. M. Hunter.
December 6th.—"Electrical Cooking as Applied to Large Kitchens," by Mr. W. A. Giltott.
December 13th.—Discussion on "The Metric System," with introductory papers by Messrs. L. B. Atkinson and A. J. Stubbs.
January 10th, 1918.—"Electrical Signalling and Control on Railways," by Mr. C. M. Jacobs.
Subjects for February 7th, March 7th, and April 11th will be announced later.

The inaugural address of the chairman of the BIRMINGHAM LOCAL SECTION (Mr. S. T. Allen) is to be delivered on Wednesday, November 14th, at 7 p.m., at the University. On December 5th, Mr. T. M. Hunter, M.A., B.Sc., will read a paper on "Gas-Firing Boilers."

Association of Mining Electrical Engineers.—A meeting of the Yorkshire Branch was held at Wakefield on Saturday last. Mr. Roslyn Holiday, of Aekton Hall Collieries, occupied the chair, and delivered his presidential address. A paper on "The Installation and Maintenance of Underground Plant" was then read and discussed.

British Fire Prevention Committee.—The Committee commenced its winter session during October, and has planned a number of testing operations for the coming spring, and the usual issue of its publications during the winter. It has issued some of its usual Red Books on recent American fires, but some of the reports of the Committee on fire preventive questions that were prepared earlier in the year for the use of the authorities cannot be made available to the public during the war.

The Committee's service of fire "warnings" continues to be extended, and there have been numerous re-issues during the past quarter. New issues of notices have also been made in respect of storage of coal in bulk and the treatment of buris under an up-to-date non-proprietary system.

Electricity in Agriculture.—In the report of the Conjoint Board of Scientific Societies, just issued, it is stated that the Sub-Committee on the Application of Science to Agriculture emphatically believes that a great future awaits the development of electrical applications to agriculture in this country. Reference is made to the probable action of the Board of Trade Committee on Electric Power Supply in the direction of rendering cheap power available in agricultural districts, and to the extended use of electricity on farms in Germany; the advantages of electric ploughing are emphasised, and electroculture receives a favourable notice. It is added that on October 10th the Conjoint Board recommended the Board of Agriculture to grant funds for the construction and testing of an electrical tractor and other agricultural machines. Owing to the late arrival of the Report, we must defer detailed reference to its contents till next week.

Association of Electrical Station Engineers.—A meeting was held in Manchester, on October 25th, to continue the efforts of the Local Committee of the A.E.S.E. to obtain further support for this Section of the Association. The Committee reported that the membership was increasing rapidly. The following resolution was approved:—"That each application for admission to the Association should be considered on its merits, special emphasis being laid on the necessity of training, general capabilities, and responsibility of position." A vote of thanks was unanimously accorded to the Editors of the ELECTRICAL REVIEW for their sustained support of electrical station engineers in their efforts to improve their status. A special general meeting is to be held at Seller's Restaurant, 86A, Market Street, Manchester, at 7.30 p.m., on Thursday, November 8th, to discuss the question of the awards of the Committee on Production and their applicability to station engineers, and it is hoped that all station engineers interested will attend. Inquiries concerning this Section of the Association should be addressed to the Hon. Secretary A.E.S.E., 15, Lotherton Street, Harpurhey, Manchester.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—The L.C.C. Highways Committee recommends that Mr. H. R. DOCKER, second-class assistant in the Council's tramways department, be appointed time-tables assistant at £262 per annum, rising to £300, and that Mr. H. W. WOODS, A.M.I.E.E., at present senior charge engineer in the service of the Manchester Corporation, be appointed a charge shift engineer at Greenwich generating station at £250 per annum, rising to £300. The Committee considers that the present time is not opportune

for making a permanent appointment of a publicity assistant for the tramways, and proposes that, as a temporary measure, a woman be engaged to assist in publicity work.

The Luton E.C., which for some time past has been considering the question of revising the salary of Mr. W. H. COOKE, the electrical engineer, now suggests an increase from £600 to £700 a year.

Mr. HENRY CLAYTON has been appointed assistant engineer and manager of the Preston Corporation tramways, at a salary of £200 per annum. He has been in the service of the Corporation for about 12 years.

Heston and Isleworth D.C. has agreed to Mr. P. RYCMORT, its electrical engineer, devoting his full time to his duties in the Coal Control Office, and giving his honorary supervision to the Council's electricity department when required.

Mr. W. A. TORRIN, testing and commercial assistant at Greenock Municipal electricity works, has been appointed assistant electrical engineer under the Chesterfield Corporation at £250 per annum.

The Doncaster Town Council last week accepted the Electricity and Tramway Committee's recommendation granting Mr. G. A. ROBERTS, acting electrical engineer, and Mr. T. POTTS, acting traffic manager of the tramways, an increase of £50 per annum each on their salaries, during the absence of Mr. RAYNER, the chief engineer, on Government service.

The Blackpool Tramways and Electricity Committee has decided to grant the following salary increases to officials in those departments:—Electricity Staff: Works superintendent, £250 to £300; mains superintendent, £234 to £284; chief clerk, £175 to £225; two engineers-in-charge, £175 to £215 each. Tramways Department: Traffic superintendent, £250 to £300; resident engineer, £234 to £284; chief clerk, £156 to £206. No war bonuses are to be granted in addition.

Congratulations to Mr. R. TORRY, Loughborough electrical engineer of Tumble Wells, who has been presented with a Royal Humane certificate for entering the sea fully dressed and rescuing a bather. The presentation was made by the Mayor of Eastbourne.

General.—Major HENRY NEWTON, D.S.O., a member of the firm of Newton Brothers (Derby), Ltd., electrical engineers, has been appointed Assistant Director of Trench Warfare. He went out to France as a Territorial Captain in the 5th Notts. and Derby. Battalion, which was mobilised at the outbreak of war, early in 1915. His experience of actual trench warfare soon supplied the necessary material for his inventive talent. Many useful and efficient devices were the outcome of his labours for the destruction of the enemy and the greater comfort of our own men, which in those lean days of want were very much appreciated. He then founded the Second Army workshops, which became well known to those in France, where a large number of hands are employed in the manufacture of his inventions and other war material. His services were recognised with the award of the D.S.O., and he was later appointed a member of the Trench Warfare Committee. His hard work and ability have led to this new appointment, and he has earned the congratulations of his many friends.

Mr. A. W. JAMES, the assistant works manager and a keen supporter of the Sterling Athletic and Social Club, has presented a handsome cup for a rifle shooting competition, for which in the first round, as well as for the gold medal presented by Mr. F. W. WILKINSON, there has been some very keen shooting. The Club, by a narrow victory over Hendon and Crickelewood, has passed into the second round of the Burroughs & Watts Competition.

Mr. WALTON, who for the past eight years has been on the engineering staff of W. T. Henley's Telegraph Works Co., Ltd., has obtained a position with the Ministry of Munitions (Air Board). Mr. Walton belongs to the old school of electrical engineers, and has been connected with electrical work almost from its infancy. He served his apprenticeship at the works of John Fowler & Co., Leeds, going through the drawing office and the shops. The Leeds electric lighting station was the first undertaking with which he was connected. He has contributed several articles to our pages.

Roll of Honour.—Second-Lieutenant H. F. GILL, R.E., Wireless Section, of the secretarial department, County of London Electric Supply Co., who had been awarded the Military Medal in 1916, has recently been wounded in France, and is at present convalescent in London, and has now been awarded the Military Cross.

Corporal G. WHILDON, London Regiment, formerly in the London office of the India-Rubber Co., was killed in France on October 1st. Sergeant N. G. FAIRALL, Australian Infantry, who was in the electric light department before joining the Sydney branch of the same company, was wounded in France on the 12th inst. Private J. BROWNING, Middlesex Regiment, formerly in the general office of the company at Silvertown, was recently wounded in France.

Gunner A. HOMER, R.F.A., who has died of wounds, was in the employ of the British Westinghouse Co., Ltd., Trafford Park.

The death in action reported of Private T. COOK, King's Liverpool Regiment, who was employed by Messrs. Dick, Kerr & Co., Ltd., of Preston.

Sapper E. CLAVEL, R.E., who was mentioned in dispatches to him Lieut.-General Sir Stanley Maude for gallant and distinguished service in the field, and who has died in hospital,

was employed in the Warrington Corporation electricity department.

Temp. Captain E. MANNOCK, R.E., attached to the R.F.C., who has been awarded a bar to the Military Cross gained last September, was formerly on the National Telephone Co.'s staff at Canterbury. On the outbreak of war he was in Constantinople, engaged on a contract for telephones for the Turkish Government. He was detained for a time as a prisoner of war, but was released, and reaching England joined the R.A.M.C.

Lance-Corporal W. BANNING, Machine Gun Section, who has been wounded, was an overhead linesman on the Mewborough & Swinton Tramways.

Second-Lieutenant C. H. PLATT, Royal Warwickshire Regiment, who has been severely wounded, was a draughtsman with Messrs. Siemens Bros., Stafford.

Private W. W. HOLEY, Royal Warwickshire Regiment, who has been killed whilst attending the wounded, was in civil life engaged as an electrical engineer at Whitby.

Corporal E. P. MOORE, Machine Gun Section, who has died of wounds, enlisted from the electrical laboratory of the B.T.H. Co., at Rugby.

Rifleman B. C. LANE, Rifle Brigade, who has died as the result of wounds received in action, was in the drawing office of the B.T.H. Co. at Rugby. He was discharged from the Army last April.

Company-Sergeant-Major G. H. HAYES, Royal Warwickshire Regiment, who was an employee of the B.T.H. Co., at Rugby, has died of wounds received in action.

Wireless Operator F. J. STIBY, killed whilst serving with a siege battery, enlisted from the staff of the Bath Corporation electricity works.

Private C. W. EDWARDS, Royal Welsh Fusiliers, killed in action, was on the staff of Messrs. Crispin, electrical engineers, of Bristol.

Private J. BAIN, R.A.M.C., who has died from wounds, aged 33, was a fireman at the Falkirk Corporation electric power station.

Sergeant A. HARISREICTER, first reported missing, and now reported killed, was employed by Messrs. C. Macintosh and Co., Ltd.

Private J. BUENS, Argyll and Sutherland Highlanders, who was employed by the Scottish Electric Power Co., Falkirk, is lying in a London hospital wounded.

Second-Lieutenant K. L. JAMES, who fell in May last, and is believed killed, aged 29, took a first-class in electrical engineering at the City and Guilds Technical College. When war broke out, says the *Times*, he was superintending the laying of an underground telephone cable for Callender's Cable, &c., Co.

The Military Medal has been awarded to Rifleman T. BARNETT, London Regiment, for carrying ammunition to the front line through a heavy barrage during advance at Ypres. Private A. W. MORRIS, Machine Gun Corps, has been wounded in France. Both were in the electric light department of the India-Rubber Co., Silvertown.

Private J. E. ASHTON (21), Royal Warwickshire Regiment, formerly in the employ of the Electric & Ordnance Works, Birmingham, has been killed in action.

Private F. G. WHARTON (21), Worcester Regiment, has fallen in action. He was an employee of the General Electric Co., Ltd., at Witton.

Lieutenant R. B. MATHEWSON, R.F.C., who was an electrical engineer with the Dundee Corporation, and was a grandson of the late ex-Provost Brownlee, of Dundee, is reported missing.

Acting-Major G. S. TAYLOR, R.E., who was chief assistant electrical superintendent of the N.E. Bly. Co., has been awarded the Military Cross.

Gunner G. H. WILSON, formerly a driver on the Leeds City Tramways, who has been killed in action, has been awarded the Military Medal.

Second-Lieutenant L. FLEET, R.F.C., who was formerly an electrical engineer in Manchester, was killed on Saturday last at Doncaster, a mishap to his machine causing it to crash to the ground.

Obituary.—MR. W. K. D'OYLEY BIGNELL.—The *Morning Post* records the death, on Friday last, of Mr. William Kd D'Oyley Bignell, of the Indian Telegraph Department, in his 78th year. Mr. Bignell was appointed to the department in 1857, and 11 years later became Superintendent at Nagpur. He subsequently served in the Punjab, and arranged telegraphs during the Hazara Expedition in 1888, and became Chief Superintendent in 1892, retiring three years later.

CITY NOTES.

Dick, Kerr and Co., Ltd.

The annual meeting was held on Wednesday, at the Cannon Street Hotel. Mr. CLAUD T. CAYLEY, who presided, said that, comparing the present balance-sheet with that presented a year ago, the net profit showed an appreciable increase. The figures, taken in conjunction with the

totals of assets and liabilities, indicated the magnitude of the company's operations, although they would quite understand that under present circumstances they were unable to publish details. The total of the assets shown in the balance sheet was £2,193,688, as compared with £1,753,410 last year. The increase in the investments was the result of the acquisition of the shares in the United Electric Car Co., Ltd. The capital expenditure at the works showed a decrease on last year's figure, due to their policy of writing off what they considered ample depreciation against this item. Nobody could forecast what post-war conditions would be in the business world, and it therefore seemed essential to avoid the least possibility of inflation of their capital assets. The liabilities side of the sheet showed one particularly important variation from last year's figures, namely, the increase under the heading of creditors and estimated liabilities. This figure was £953,596, which was a large advance upon last year, although the increase was, of course, set off by the increases on the asset side of the balance sheet. The reason for this increase in creditors was that it included the reserve they had set aside for the Excess Profits Duty, as, although their liability under that heading had not yet been definitely settled, it was very obviously necessary for them to reserve what they considered a sufficient sum to meet this charge. The Government continued to be their principal customer, with continuously increasing demands both in quantity and variety. He wished he was allowed to tell them in detail of the ramifications of manufacture and construction which had been undertaken and successfully completed by the company, and still more would he like to tell them of what was being done now, and about to be done in the immediate future. Suffice it to say that all the Departments for which they were working showed their appreciation and confidence in a very practical way, by entrusting them with important work to the limit of their capabilities. The national factory erected under their auspices had been handed over to the Government, and they had now in hand the erection of two more factories for another purpose, and these, together with the construction of important works in different parts of the country, on which they had been occupied for some time, kept the contracting department very busy, and their staff of trained engineers fully occupied. In regard to the controlling interest which had been acquired in the United Electric Car Co., Ltd., the board already felt that transaction to be fully justified, so much so that steps had been taken to extend the shops to cope with work of great importance. The United Electric Car Co. were next-door-neighbours of theirs at Preston, the works occupying an area of some 15 acres, and they made a speciality of tramway car-building. The directors were satisfied that after the war there would be no difficulty in keeping them fully occupied upon profitable work, and, in the meantime, they were serving the national interests. Last year they reported the acquisition of control in Messrs. Willans & Robinson, Ltd. The position had now been consolidated by the acquiring of 86 per cent. of the preferred "B" stock of that company, which had certain participating rights. This transaction was carried through partly by payment in cash and partly by exchange of shares. As it did not take place until after the close of the year under review, it was not reflected in the balance sheet. Steps were now being taken to consolidate the organisations of the two companies, and considerable economy was to be expected both in selling and production. Considerable interest had been shown in the contracting world and among the legal profession in the now somewhat celebrated case of the Metropolitan Water Board v. Dick, Kerr & Co. This was still *sub judice*, as, although it was argued last week in the House of Lords, judgment had not yet been given. He had given them the position as they saw it at present, and he thought it might be taken for granted that their organisation and works would be fully occupied during the continuance of the war period. Last year, and the year before, he indicated the likelihood of their having to face a period of uncertainty during the transition from war conditions to normal conditions of peace, whatever the world had in store for them in that direction. The directors and management committee fully realised this, and, therefore, in spite of the abnormal amount of work thrown upon their shoulders, particularly the latter gentlemen, they were doing what they could towards organising for the future, so as to make this transition period as short as possible. He thought they might safely assume that the immediate demand for the product of their different manufacturing works, and also of their engineering contracting organisation, would be very great, and it behoved the management to see that they were in a position to step into the breach without delay. Like all large employers, naturally they were following the attitude of Labour itself, and fully realised that to meet the necessities of after-the-war conditions a complete understanding and co-operation between Capital and Labour was both desirable and necessary. The directors and the management committee had confidence that all would be well in this direction provided Labour was met in a spirit recognising that an entirely new basis of relationship must be established. Given the country and the Empire met the new conditions that were bound to arise after the war fairly and squarely by adopting new methods of Empire and international commercial relationship, he thought the internal relationship of employer and employed could safely be left to the common sense of those directly concerned.

Mr. R. H. PRESTWICH seconded the motion, and the report was adopted without discussion.

International Light and Power Co.

The net profit, after payment of debenture interest, London and Canadian administration expenses, and interest on loan, and setting aside £2,500 as a special reserve, amounts to £10,331, plus £6,744 brought forward, which is to be carried forward. Further cash advances were made to subsidiary companies on account of capital expenditure, amounting to £19,400. The directors regret that on account of the position of the Mexican undertaking, and the necessity for increasing the advances to subsidiary companies out of earnings; it has not been possible since October 1st, 1915, to pay a dividend on the cumulative preference shares. If, however, the present improvement in Mexico is maintained the directors hope that during the current year they will be in a position to resume payment of dividends on these shares. The subsidiary companies operating in Venezuela and the Argentine have placed to reserves for renewal and general purposes £7,123. Including the reserve of the Mexican company, which has not been added to, the total reserves of the three subsidiaries now reach £39,442.—*Financier*.

Eastern Telegraph Co., Ltd.

Sir J. WOLFE BARRY presided at the meeting held on October 21st. He said that owing to delays due to the war they had not been able to submit their accounts at the usual time. The net result of the year's working was remarkable, the gross revenue for 1916 being nearly £415,000 in excess of that for 1915. The expenses showed an increase of about £201,000. The actual profit was better than for 1915 by £213,400. Notwithstanding heavy duties and large increase in expenditure, they had been able to put £500,000 to the general reserve, to pay 8 per cent. free of tax, and to carry forward £28,000 more than for 1915. The company now held on account of the general reserve fund £1,700,000 of the 5 per cent. War Loan Stock. The total amount of that stock held by this and the other associated companies in Electra House was about £6,000,000. At the last meeting he stated that the principal factors that had caused an increase in the number of words carried were the interruption of the Indo-European Telegraph Co.'s line to India, and also the reduction in the carrying capacity for commercial work of the Great Northern Co.'s route to China and Japan on account of the Government requirements; but the further increase over last year was no doubt to a large extent due to the increasing uncertainty of postal correspondence throughout the Empire, which had caused merchants and others to rely more than ever upon the more certain medium of cable communication.

Eastern Extension, &c., Telegraph Co., Ltd.

At the annual meeting, on October 23rd, Sir J. WOLFE BARRY, who presided, referred to the reasons for the delay in submitting the annual accounts. The gross receipts for 1916 amounted to £1,221,000, an increase of £271,000, which was due to development of traffic all over the company's system, including the important local traffic between India and China, Japan, Straits Settlements, &c. Working and other expenses increased by £44,000. The net revenue was increased by £227,000. The agreement entered into by the French Government with the company in 1884 for providing and maintaining, under a subsidy arrangement, cable communication between the French possessions of Cochinchina and Tonquin had expired, and the cable had been sold and formally transferred to the French Government. After crediting capital expenditure with the cost of that cable (£121,454), which was originally debited to that account, the loss resulting from the transaction, amounting to £66,153, had been debited to the general reserve fund. Under arrangements made with the Governments of the Australian Commonwealth and New Zealand, the company's cable stations at La Perouse (near Sydney) and Wakapuaka (near Nelson) had been closed, and its cables between Australia and New Zealand extended to Wellington, where they were now being worked direct with Sydney under greatly improved conditions. The cost of the extensions and partial renewals of these cables would be debited to the general reserve fund in the accounts for 1917.

Drake and Gorham, Ltd.

The directors report that after payment of all charges, including staff bonuses, &c., and making provision for contingencies, the net profit for the year ended June, 1917, is £11,395, plus £2,150 brought forward. A dividend of 5 per cent. for the year absorbs £6,250, £5,000 is applied to writing down goodwill, and £2,296 is carried forward. The trading profits have increased by £2,868, an improvement of 30 per cent. on the previous year's figures. Contracts have been completed for the Admiralty, War Office, Ministry of Munitions, and other Government Departments, and a considerable amount of similar work is in hand. Both the wholesale trading department and the works show improved results, and the sale of self-propelled electric vehicles has grown rapidly. Arrangements have been completed for the leasing of a larger warehouse as well as works with greater manufacturing facilities. The directors have voted the further £854 to which they are entitled under the Articles as a war bonus to the office staff.

Credenda Conduits Co., Ltd.—The directors are unable to present the accounts for the year to April 30th. They are satisfied that the interim dividend paid on July 25th last has been earned, but it is not their intention to recommend any further distribution for the year.

Hurst, Nelson & Co., Ltd.—The gross profits for the year to July 14th were £78,770, against £78,426. Dividend at the rate of 10 per cent., and a bonus at the rate of 2½ per cent., free of tax, the same as a year ago.—*Times*.

Russia.—The Electrical Power Co. (capital 9,000,000 roubles) made a profit of 2,036,781 roubles in 1916, against 2,290,590 roubles in the preceding year, and it has paid 780,000 roubles in dividend, the same as for 1915.

The Synchronous Transmission Co. has been formed. Capital: 100,000 roubles.

Calcutta Electric Supply Corporation, Ltd.—Interim dividend of 7 per cent. per annum (3s. 6d. per share), less income-tax, on ordinary shares for half-year.

Victoria Falls & Transvaal Power Co.—The net earnings for the quarter ended June 30th were £224,978, before providing for taxation in South Africa and the United Kingdom.

Anderston Foundry Co., Ltd.—Interim dividend, 4s. 6d. per share, less income-tax.

Westinghouse Brake Co.—Interim dividend of 5 per cent., less income-tax, on ordinary shares.

anyway, of the proprietors' claims to higher rates. The electrical railways are, of course, not so directly under the eyes of the Government as the steam companies are, and there is at least a faint chance of the Metropolitan's modest 1 per cent. being improved upon in January.

Cable stocks and shares are very firm, on the issue of the final dividends and reports in respect of the year 1916. The industry has done well out of Government and Press work; the uncertainties of postal correspondence, said the Eastern Co.'s chairman the other day, have caused merchants and others to rely more upon the surer medium of cable communication. Seven of the largest of the cable companies increased their net receipts to an aggregate of £3,589,773, an improvement of £350,000 over the 1915 figures. The Cuba Submarine raised its dividend from 5 per cent. to 7 per cent., the Western from 7 per cent. to 8 per cent., and the Great Northern from 22 per cent. to 24 per cent.

The Eastern Telegraph owns, or leases, 46,638 miles of cables and 3,950 miles of land lines. The "China" has 27,258 miles of cables and various working agreements with other companies. The Great Northern owns 8,000 miles of cables, the Indo-European 3,800 miles, and the Cuba Submarine 1,600 miles. The Great Northern Co.'s report illuminates some of the difficulties of present-day working. "Nearly all the cables," says this report, "belonging to the company in Europe cross the continually expanding minefields and prohibited areas, and should breaks occur in such places it may prove impossible to have the cables repaired." There must be plenty of material, one would suppose from the recent cable reports and meetings, for a book to be written on the danger and romance of cable work in war-time.

STOCKS AND SHARES.

TUESDAY EVENING.

News from the Italian front led to a weakening of Stock Exchange prices at the first part of the week, and the disappointment felt with the prospect of the war's being protracted as the consequence of our Allies' reverse was responsible for a generally subdued tone throughout the stock markets. It cannot be said to have acquired any influence over electrical issues, but the mere fact of business having been checked was sufficient to colour the tone drab. Sentiment began to recover on Tuesday, though the volume of buying is perceptibly less, and markets go cautiously in all departments.

With the publicly-announced entry of Brazil into the war, there has been a little selling of Brazilian stocks, Government, railway, and industrial. Why this should be is something of a puzzle, but the fact remains, and Brazil Traction further weakened to 44. Argentine industrials are also out of favour, thanks to a series of very poor results from the principal railway lines of the Republic. Anglo-Argentine Trams are not notably lower, but the market is not a good one. Much the same description applies to Mexicans, though here, again, there are no movements to record.

Charing Cross ordinary shares are ½ better at 4, and South London keep a very firm spot at their advanced price of 3. Edison Swans are being bought again, the fully-paid rising to 2½, the others to 26s., and the 4 per cent. debenture stock to 74½. Callenders recovered their dividend of 5s. per share, the price being left unchanged at 14½ xd. British Westinghouse debenture is up a point to 69. Aron Motors, after having been dormant for many moons, nearly doubled in price to-day (Tuesday). The ordinary, from being eighteenpence, rose to half-a-crown, while the preference improved from 1s. 6d. to 7s., with hardly any shares offering of either class.

British Insulated Wire shares are now quoted in their new guise of £1 shares, the ordinary being 3 and the preference 1, equal to 15 and 5 respectively for the previous £5 shares. The ordinary show a rise of ¼ on the old shares. At 3, the yield is 6½ per cent. on the money. Babcock & Wilcox declined to 3½; the armament list is firm, with Armstrongs all but 40s. India-Rubber preferences are harder at 7½.

Marconi shares went back on the Italian news, the decline being explained by a market humourist as due to the nationality of the famous inventor! This little joke did not amuse the operators, who have been recently buying more than they wanted for investment purposes, and whose pressure to realise lowered the price of the parent shares ½ to 3 5/16. Americans to 21s. 9d., and Canadians to half-a-guinea. Something of a bull account had been built up in Marconi, and reaction is the inevitable sequel to an overdose of buying followed by any kind of disappointing news that affects business generally.

Nothing has occurred to encourage Home Railway stocks, and prices once more display a tendency to sag. Metropolitan shed ¼ to 23½, and the other Undergrounds are heavy in tendency. There is a mild agitation afoot, calling upon the Government to increase the dividends upon the stocks of the controlled lines at the next payment-time, but we imagine that those who most ardently advocate it cannot seriously suppose the Government will take notice, effective notice,

Exports and Imports of Electrical Goods during July, August and September, 1917.

THE official returns of electrical exports and imports for the months of July, August and September, which we publish below, show, as regards the exports, totals of £394,339, £393,882 and £288,956 respectively, which compare with the three preceding months as follows: April, £308,511; May, £316,317; and June, £367,520. It will be noted that the values have been well maintained, except as regards September, when machinery, telegraphic and telephonic values fell off considerably.

Electrical machinery exports had up to September shown an upward tendency for some months, the values recorded being well up to last year's average values, despite the difficult conditions introduced by the war: the August exports of telegraphic material included some £15,500 worth of submarine cable. The electrical import values for the three months under review were: July,

£218,741; August, £179,994, and September, £210,237, which compare with totals of £235,985 in April, £236,799 in May, and £186,888 in June, and show, if anything, a falling-off in value. It will be noted that lamp imports attained only small values during the months referred to, but battery imports have shown a considerable advance in value.

The re-exports of foreign and colonial electrical material fluctuate considerably in value, and attained a fairly high level in September. The figures for the past seven months, up to and including September, have been as follows:

March, £17,795; April, £13,262; May, £17,403; June, £14,927; July, £13,757; August, £13,851, and September, £27,522. These figures compare with a monthly average of, roughly, £16,000 during the years 1915 and 1916.

THE HIGH-TENSION MAGNETO.*

(Concluded from page 406.)

THE DESIGN OF AEROPLANE MAGNETOS.

Reliability.—In the case of an aeroplane magneto, this is a consideration of primary importance, because failure of the magneto may mean sudden destruction of the machine and pilot. An aeroplane type of magneto should be most carefully and rigorously tested before it leaves the manufacturer. During this test the strain put upon the machine, both mechanical and electrical, should be greatly in excess of the maximum strain likely to obtain under abnormal working conditions. These fundamental considerations were carefully borne in mind when arranging the series of tests to be imposed upon the type "A" magneto.

In the case of the armature, extraordinary precautions were taken—first, by carefully inspecting all the insulating material and each reel of enamelled wire, and secondly, by subjecting the finished armature to a prolonged electrical test with the secondary discharging at 9,500 volts between electrodes. In addition to this, the armature is inspected several times at various stages of the winding and finishing process.

Every magneto is subjected to running tests as follows:—

1. Run for 20 hours at 2,500 R.P.M. at air temperature, with each distributor terminal connected to a spark gap adjusted to discharge at 7,500 volts.
2. Completely dismantled and the various metal parts cleaned in petrol. Magneto then reassembled and adjustments made where necessary.
3. After re-magnetising, magneto run for four hours at 2,500 R.P.M., with spark gaps as under (1), in a hot box with air at 100 deg. F.
4. At the end of this final run the magneto is tested at low speeds to ensure that the sparking characteristics are satisfactory.
5. Before shipment, the magneto is inspected in every detail, all adjustments are carefully checked, and screws tightened and locked where necessary.

Weight.—It is obviously desirable to keep the total weight of an aeroplane type magneto as low as possible. To do this, it is first necessary to develop a design that requires a minimum volume of material, and secondly, to use, if possible, aluminium castings. Special steels should also be used wherever possible, so that the required strength can be achieved with a minimum weight of material.

The castings made of an aluminium-copper alloy containing no zinc are to be preferred to sand castings, because the general appearance of the magneto is enhanced thereby, and the amount of machining that has to be performed on the parts is very considerably reduced. Furthermore, the metal is much tougher, and the threads in tapped holes are not so likely to become stripped when the screws are securely tightened.

Elimination of Fire Risk.—This is of vital importance, because any sparking within the magneto may, under operating

conditions, be the means of initiating a fire by igniting a mixture of air and petrol in the surrounding medium. Tests were carried out by the N.P.L. in the early days of the war to determine the extent of this danger. A number of different types of pre-war Bosch magnetos were run in a chamber that could be filled with an explosive mixture of air and petrol. Generally speaking, it was found that explosions were likely to occur as a result of:—

- (1) A succession of sparks at the safety gap.
- (2) Sparks between distributor segments or other high-tension parts, and the frame of the magneto.
- (3) Sparks at the contact-breaker points.

Trouble is most likely to arise from cause (1), although this was eliminated by enclosing the safety spark gap in a fine mesh gauze casing on the principle of the Day safety lamp, so as to prevent any explosion in the immediate vicinity of the safety gap electrodes being propagated in the surrounding medium.

Trouble due to causes (2) and (3) can be eliminated by careful attention to the design of the magneto to prevent any wasteful sparking of this nature. In the type "A" magneto this is done, whilst the safety spark gap is contained in a separate gas-tight chamber fixed underneath the distributor and provided with a ventilation hole covered with a piece of very fine mesh gauze. As a "spark-gap" type of distributor is used, it is necessary to provide some form of ventilation, so that the products of ionisation can escape. Here again the ventilation hole in the front of the distributor is covered with a piece of fine mesh gauze, and the whole combination is thus perfectly safe. Very severe tests carried out on this particular machine, by introducing an explosive mixture of coal-gas and air into the contact-breaker housing, safety-spark-gap chamber, and distributor, have quite confirmed this view that the risk of fire under operating conditions has been entirely eliminated.

In the 12-cylinder polar inductor magneto previously described, the safety spark gap rotates with the distributor brush. This is a distinct improvement upon the stationary form of spark gap generally adopted, because the products of ionisation are churned up and quickly expelled through the ventilation window provided in the front of the distributor. This window is covered with gauze, as in the type "A" machine, which makes the magneto fireproof.

Variable Timing.—Several thousand type "A" eight-cylinder aeroplane magnetos with fixed ignition have been supplied, so presumably on certain types of engines variable ignition is not required.

When starting a petrol engine it is, generally speaking, necessary to retard the ignition so as to prevent the explosive wave in the cylinder being sufficiently propagated before the piston reaches the top of its stroke to produce a backfire.

In the case of an aeroplane engine, the necessity for making such an adjustment should not arise if a hand-starting magneto provided with H.T. switch is used. In view of the fact that the hand starters now being used in this country are not fitted with this special cut-out switch, it seems necessary that some provision should be made either inside the magneto or in the outside drive for an adjustment of this nature. The method of obtaining adjustment of the timing, adopted

* Abstract of paper read by Mr. A. P. YOUNG, A.M.I.E.E., before the AERONAUTICAL SOCIETY.

by the Bosch Co. in their pre-war rotating armature type magnetos, was to make provision for rocking the contact-breaker cam housing through a definite angle ranging between 16 deg. and 35 deg. Obviously, any angular displacement of this housing will cause the spark to occur either earlier or later in each cylinder.

The primary current curves clearly prove that at low speeds—when the necessity for retarding the ignition is greatest—any retarding of the spark will greatly weaken its intensity. At high speeds, on the other hand, the reverse is true, and the spark becomes stronger as the timing lever is retarded.

The inherent defect of a H.T. magneto, as ordinarily constructed, can be overcome by providing special sliding poles, which are mechanically connected to the timing lever, so that their position is changed at each adjustment of the timing. A design of this kind is used on one of the Bosch Co.'s latest magnetos, developed since the outbreak of war, and it ensures that when the primary circuit is broken, the armature always bears a definite relation to the pole pieces, regardless of the position of the timing lever. In consequence, the current I_b for any given speed will remain constant, and the intensity of the spark will be the same for all adjustments of the timing.

Having overcome one inherent difficulty, the other one associated with the distributor still remains. If we assume that when the timing lever is fully advanced the contact-breaker points close just before the carbon brush leaves the distributor segment—and at very high speeds the H.T. spark will persist until the contacts close—it is clear that with the lever fully retarded the carbon brush will be some distance off the segment when the spark ends. In other words, sparking between carbon and segment will result, which must tend to burn the brush track. This difficulty can only be overcome by designing the contact-breaker cams to give a very short period of open circuit (θ_1), but from other considerations it is undesirable to make θ_1 too small. The difficulties likely to arise in this connection are more pronounced on a 12-cylinder magneto, where the problem of distribution is very complex.

Taking everything into consideration, therefore, the author holds that in the case of an aeroplane magneto, adjustment of the timing should be made outside the magneto and incorporated in the drive by the engine designer. This enables the magneto designer to work out his design on the basis of fixed ignition, and he is thus enabled to simplify the mechanical construction of the machine and arrange matters so that the magneto will give the very best electrical performance over a wide range of speed.

The problem of devising some mechanical method of adjusting the timing that can be incorporated in the magneto drive is not difficult of solution. For example, some form of sleeve working on a coarse thread and capable of movement in an axial direction can be provided for this purpose. On these lines it is possible to develop a scheme whereby both magnetos (in cases where two-point ignition is adopted) can be adjusted in phase by the movement of a single lever. It is also possible to provide for adjustment through a worm spindle operated by a flexible drive terminating in a hand wheel placed in close proximity to the pilot. This latter method would allow of a remarkably fine adjustment being obtained.

Now that a British magneto industry has been established on a sound foundation, it is vitally important that when the war is over this industry should be supplied with the necessary materials used in the construction of high-tension magnetos from within the British Empire. Only in that manner can we secure a truly British-made magneto. Viewed from the national standpoint only, such a course is absolutely essential, because otherwise, in the event of war, this industry, upon which so many other war industries are dependent, will be handicapped for lack of one or more essential materials.

Varnished paper, silk, and cambric are essential to the manufacture of a satisfactory magneto armature, and although they can be purchased in England at the present moment, the greater portion of this material is imported from America. The very fine mesh silk is woven in Japan, and the varnish manufacturer is at the moment depending on supplies obtained from foreign countries.

At the present moment there are several manufacturers in England who are making moulded insulating material similar to the German stabilite, and recent progress has been most gratifying. There seems absolutely no reason to suppose that the English manufacturers will not eventually be in a position to adequately meet all the demand for this class of moulded material, but co-operation between them and the magneto manufacturers is necessary.

The most satisfactory distributor carbon brushes are at the moment being manufactured in France, although one English manufacturer has certainly made very commendable progress. This is another case where hearty co-operation between the brush manufacturer and the magneto manufacturer is necessary if the best results are to be achieved.

It is hoped that the manufacturers of die castings will take steps to ensure that after the war is over the demand for die castings that will be made upon them by English magneto manufacturers will be fully met. The magneto industry would receive considerable assistance if it were possible to purchase brass die castings in large quantities.

In appendices the author gives a detailed analysis of the working of the battery ignition system, and the derivation of a formula which he has developed for computing the primary current in a magneto at "break."

THE TRAINING OF ENGINEERS.

At the Institution of Civil Engineers on Thursday last week an important meeting was held, as briefly mentioned in our last issue, to form a Central Organisation for improvement in and better co-ordination of engineering training. Sir MAURICE FITZMAURICE, Pres. Inst.C.E., was in the chair, and the audience included some 75 delegates representing all the engineering institutions and societies connected with the engineering industries, British and Irish Universities, technical colleges and schools, technical teachers, the Board of Trade and other Government Departments, the Dominions, and, of course, the Board of Education, though unfortunately Mr. Herbert Fisher, President of the Board, was unavoidably prevented from attendance. There was also a large number of representatives of manufacturing firms, railways, education committees, the technical Press, and other interests concerned in the questions under consideration.

In opening the discussion, the CHAIRMAN expressed the cordial sympathy of the Council of the Institution of Civil Engineers with the movement, and emphasised the great importance of the meeting, which was unprecedented in its representative character. He remarked that no proposal was made to interfere with the existing organisation of any university or society, but he believed that all parties would agree as to the desirability of coming into line with the scheme that would be put forward. The manufacturing industries depended very largely upon engineers, of whom a full supply was necessary; young engineers should be provided with an adequate training, but the means of obtaining the necessary training were not satisfactory at present.

A letter was read from Mr. Fisher, promising the hearty co-operation of the Board of Education in any suitable scheme that the engineering industry might adopt, and Mr. A. E. Berriman, chief engineer of the Daimler Co., who has shared with Mr. A. P. M. Fleming, of the British Westinghouse Co., the preliminary work of organisation, explained in detail the origin and purpose of the proposed organisation, which, he said, must be permanent and representative, must co-operate with the interests concerned, must exert an *active* influence, and, lastly, should be independent of financial assistance from the Government. Mr. Berriman's remarks followed the lines of a memorandum, of which the following is a brief abstract:—

The proposal to form a central organisation originated in an informal conference of engineers and educationists, which held several meetings at the Board of Education during the early months of 1917. It soon became apparent that the amount of useful work to be accomplished was altogether beyond the scope of a temporary conference, and, with the support of the Board of Education, steps were taken to hold a meeting, at which the real need for a Central Organisation might be confirmed and some definite proposal formulated. The broad purpose of the proposed organisation is to provide the engineering industry and profession with a representative brain and articulate voice on educational matters; any such scheme essentially depends on the combined assistance of the various institutions, not only in creating and in helping financially to maintain the organisation, but in enabling it to perform its functions efficiently through the principle of devolution. Primarily, it will co-ordinate things that exist, and bring them together in conference, so as to avoid overlapping of effort.

There are three objects in particular on which the proposed Central Organisation might usefully concentrate its attention:—

The first is the co-ordination of engineering training, including the fostering of apprenticeship as a national institution, and the consideration of means by which the works period of an engineering pupilage may be increased in efficiency, and a wider appreciation secured for the value in industry of education of university rank.

The second is the maintenance of a central bureau, where parents and educationists can obtain accurate and comprehensive information relating to the engineering industry, and the proper course to pursue on behalf of boys who are desirous of making engineering their profession.

The third is the promotion of scholarships, or other equivalent means by which the best talent may be enabled to rise to its proper level under the stimulus of educational opportunity.

With regard to the first of these objects, co-ordination refers primarily to encouraging a proper relationship between school work and shop work for all classes of engineering students. No plan for extended school work, such as the new Education Bill foreshadows, can possibly bear its full fruit unless it is supported by a workshop instruction that is effective in fitting a boy to make the best of his future manhood, and no training for engineering management can hope to be

efficient unless the clear thought that it confers by higher education is coloured with the human sympathy and understanding that is born of personal experience in the shops among the men. Nor is it only a vocational training that has to be considered. It were short-sighted indeed to overlook the citizen and the man in trying to make the mechanic, or to forget the importance of good health and the value of a mind with many interests.

Incidentally, there is a widely recognised need for encouraging lads to become apprentices as distinct from mere members of the vast community of child labour, and this recognition extends also to the need for effecting improvement in the educational value of the works period of engineering training, whether it be for the apprentice who seeks to learn a man's skilled trade, or for the pupil who is qualifying for ultimate positions of management.

That the time is ripe to bring into existence a central organisation to which engineering firms and others could apply for information relating to apprenticeship systems and methods of training that are actually in operation, may be judged from the number of letters in support that have been received from various sources, and as to any further need for an information bureau (the maintenance of which is the second of the specified objects of the organisation), the answering of the daily letter from the perplexed parent whose son is approaching the completion of his last term at school, may in itself seem to be sufficient justification to the many engineers who would be relieved thereby from the onus of replying to this mass of correspondence. As a link by which parents, schools, and universities are enabled to get into direct touch with the engineering industry and profession, the proposed Central Organisation will be performing one of its most important rôles.

The need for making the most of those who do enter engineering is equally vital, and leads logically to the inclusion of the third of the above-mentioned objects of the organisation. Without doubt, much potential talent is prevented from developing either as quickly or as widely as it could through lack of financial assistance, and it would be a worthy endeavour on the part of the engineering world to attempt some improvement in this direction by fostering the establishment of proper scholarships, and forming a new "educational ladder," which many hope to see extend from the bench to the university for those boys, irrespective of social distinction, who are able to climb thus high. Some widening of view is still needed to obtain a general appreciation of the university standard of education as an asset of real value in practical life.

In the course of the discussion which followed, Sir DUGALD CLERK stated that highly trained men were not even yet easily placed in works; employers objected to having men in their works for a time who would go away and carry their information elsewhere. It might be necessary to invoke the aid of legislation to meet this difficulty.

Mr. MICHAEL LONGBRIDGE, Pres. I.Mech.E., expressed the hope that the manufacturing engineer would support the scheme, as its success depended very largely on his attitude towards it. Increased output was the only means of meeting the high working expenses after the war, and could be obtained only by increased efficiency and improved education.

Mr. C. H. WORDINGHAM, Pres. I.E.E., gave whole-hearted support to the proposal, and said that the keynote was co-ordination of existing resources and co-operation of existing institutions. All petty jealousies must be sunk in the effort to achieve success. He believed that the scheme outlined contained the elements of success, and said that if the new organisation could lay down standard methods of training it would accomplish an immense achievement.

Mr. W. H. ELLIS (Master Cutler) said that hitherto apprenticeship had been regarded as a privilege granted to the boy; employers should regard it as a responsibility resting on their shoulders. The ideas now associated with the word "Welfare" embodied his views on the subject.

Mr. H. B. ROWELL, Pres. N.E. Coast Institution of Engineers and Shipbuilders, Mr. W. H. HICHENS, Chairman of Messrs. Cammell, Laird & Co., and Mr. R. T. NUGENT, Director of the Federation of British Industries, gave their support to the scheme.

Prof. W. E. DALBY said that the need of such a scheme was very pressing. Ten years ago he found that in Germany 10,000 well-educated men over 18 were studying engineering, compared with only 900 in this country. The system of training followed by our colleges was as good as any in the world; the main consideration was to build a solid foundation on which any edifice of specialised knowledge could be erected. The pernicious premium-pupil system was dying out; they should pay the apprentice a living wage.

Lieut.-Comdr. C. F. JENKIN said that the scholarships should be provided by the manufacturers, who should take broader views and admit their responsibility for carrying on the education of the boys after they left college.

Sir A. SELBY BIGGE, of the Board of Education, welcomed the scheme, and laid stress on the necessity of co-ordinating the training with the use to which it would be put in after-life.

Sir WILFRID STOKES, President of the British Engineers' Association, gave hearty support to the scheme, which, he pointed out, was evidently approved by the meeting. Out of the 26 members of the proposed committee, he saw that 11

would be manufacturers, and was quite content to leave details to the committee.

Sir JOHN WOLFE BARRY then moved the resolution appointing a committee representative of 21 engineering societies and associations, the Board of Education, the Headmasters' Conference and Association, the Association of Technical Institutes, and Universities and Technical Colleges—26 in all, with power to add to their number—to initiate means to give effect to the principle of a Central Organisation.

Dr. W. H. HADLOW seconded the resolution, which was carried unanimously.

Mr. A. H. D. ACLAND, former Minister of Education, afterwards stated that Mr. Fisher would probably very soon bring in a scheme of Government scholarships as a matter of urgency, involving an annual grant of £100,000 to schools, £100,000 for maintenance scholarships, and a still larger sum for continuation scholarships at the universities.

REVIEWS.

Predetermination of Prices. By FREDERIC A. PARKHURST, M.E. London: Chapman & Hall, Ltd. Price 5s. 6d. net.

The author deals with the fundamental factors which govern the possibility of determining true costs, and his treatise is one of scientific commercial management and research. He describes largely foundry costs, but also deals with his subject generally, and in the preface states that he describes no untried theories, but that each result has been thoroughly tested by actual use, and that nothing unproved has been recorded.

Chapter I emphasises the importance of "absolute control of all sources of information," whether a simple system for a small business, or for one involving many departments and a large variety of products. He states truly that it is of no use to know when the job is finished that it "cost too much," we want to know "the cost in advance." A diagram showing the relation of true costs to profit and selling prices is interesting.

Chapter II is a discussion of elements affecting true costs. The author deals with this in a very lucid manner, and the reviewer is pleased to see the importance he attaches, *inter alia*, to:—(1) Order groups, amongst which he deals with additions or betterments to buildings, plant, &c., or, in other words, increment of capital assets. The importance of this must be acknowledged inasmuch as capital charges and maintenance are increased, therefore there is a corresponding expenditure to account for, a fact that may be overlooked in dealing with hourly rates, especially when capital charges are assessed at their valuation for the previous year ending. (2) Stores keeping and perpetual inventory. This is one of the important items in the managerial control of costing. The author's illustration—"stores card"—shows a perpetual balance, a danger limit, and the prices. The importance of price on a stores quantity card is in very many cases ignored; that it is a factor in true costing will be acknowledged when it is considered that the same class of goods may be purchased at different rates, hence, with the prices on the card, when one lot of goods is issued, the new rate is apparent for the purpose of recording the true cost of the material. (3) Bonus incentive. The author's remarks that the realisation of maximum efficiency should be recognised by a remuneration over and entirely separate from the prevailing rate of wages, will be admitted to be true.

The diagrams are straightforward, but a number of them in this and subsequent chapters are on folded sheets. In the reviewer's opinion this is a mistake, as books of this nature are usually handed round, and folded sheets become torn and parts are eventually lost; it is far better to continue diagrams from page to page until the form is finished, and it is just as easily understood. Further, the reviewer is rather surprised that more advantage is not taken of loose-leaf books for columnar work, as on a single sheet the number of columns is limited, and the book is very often large and unwieldy, whereas with the loose-leaf book columnar work is practically unlimited, and the cross additions can be shown on each page if required, but it is usually only necessary to have total cross additions on the last page of the continued form; moreover, quite a number of relative forms, summaries, &c., suitably sub-divided, can be kept in the one book, thus the data are centralised.

Chapter III describes the elements entering into direct costs, and chapter IV analyses the rather intricate problem of indirect expense, showing the use of various expense symbols in connection therewith, and discussing departmental expense distribution. The section dealing with "distribution of burden" is decidedly interesting. In a section on "Erroneous Methods of Distributing Indirect Expense," the author describes methods adopted that are incorrect, and the curve, fig. 17, graphically illustrates the error existing in a flat-rate method of distributing burden. The concluding chapters are "Recapitulation of Costs," "Estimating," "Profit and Relatively True Selling Prices," all of which the author deals with in a highly instructive manner, and in his closing remarks he states that we no longer associate lowest costs

with least output in wages, but that modern striving for low costs under proper and scientific management pays the highest wage, and has resulted in the improvement in a marked degree of working conditions.

The book will undoubtedly be a valuable addition to the managerial library, and the time taken in the study of this work will be time well spent by all interested in the scientific commercial arrangement of manufacturing undertakings, large or small.—J. C. P.

Hydro-Electric Power. By LAMAR LYNDON. Vol. I, Hydraulic Development and Equipment." London: Hill Publishing Co. Price 21s. net.

The details of hydro-electric power development are treated in a masterly fashion, the data and illustrations referring chiefly to water-power practice in the United States of America.

The volume commences with consideration of the factors which must be investigated before deciding whether a waterfall should be harnessed. The advantages of high-head falls over those of low heads are emphasised.

Formulae are given for the determination of horse power, and it is pointed out that when calculating power it is usual to take the weight of a cubic foot of water at 62½ lb. In tropical countries, however, this is too much, because water at a temperature of 100 deg. F. weighs only 62.06 lb.

It appears that in the States the power companies have two ways of charging. The first, called primary power, is a contract for supply all the year round, regardless of fluctuations of stream flow. The second, called secondary power, is usually guaranteed for only nine months in the year, and the charge for this is, naturally, at a much lower rate.

Diversity factor, defined as the ratio of the maximum connected load to the maximum station output, is stated to range from 1.5 to 2.0.

Pipe Lines.—The diameter of the smallest size pipe to deliver a given amount of power is that in which the loss of head in the pipe is 0.351 of the total head. Under the condition of delivery of maximum power, such a pipe-line would give only 64.9 per cent., which is much too low for any condition, except where only a limited amount of power is required from a fall, and where the pipe line is very long. It is pointed out how a pipe line may collapse inwards by a too rapid opening of the water-wheel gates, allowing the water column in the inclined section to accelerate rapidly and thus cause a separation of the lower portion from the upper and only slightly inclined portion, which cannot accelerate so quickly.

The advantages of wooden stave pipes over steel plate pipes are stated to be:—(a) The low first cost, (b) ability to act as a heat insulator and prevent freezing, (c) not so subject to injury from settling or expansion and contraction, (d) can be quickly repaired with material easily obtained, (e) the friction loss is less than with steel, (f) the loss does not increase with time, (g) the materials of the pipe are light and easily transported. The life of a stave pipe depends more on the durability of the timber than on the bonds. Only in rare instances have bonds failed first.

Dams.—The design and construction of dams are gone into very thoroughly, and they are stated to be of three types:—(1) The gravity dam, in which weight of material resists the water pressure, (2) the hollow dam, having an inclined up-stream face, (3) the arch or cambered dam, which in plan is curved and acts as an arch. In this form the pressure of water is resisted by the arch action, and it is therefore necessary to have unyielding walls at each end to resist the stresses transmitted to them. An illustration is given of the Halligan arched dam, which is 62.3 ft. high at the crest of the spillway section, and 350 ft. long, the chord length being only 334 ft.

Water Wheels.—Under the heading "Impulse Wheel or Pelton Wheel," there is a discussion of various methods of regulation. Where constant speed is required, and changes in power delivered to the wheel must be quickly effected, a combination of needle-nozzle and of jet deflection is sometimes employed. A modification of the deflecting nozzle due to the Allis-Chalmers Co. is shown, this having its moving portion and centre of oscillation near the discharge end of the pipe.

The last chapter deals with speed regulation of water wheels and abnormal penstock pressures, and also gives very valuable information on such matters as (a) time periods of governors, (b) water hammer, (c) relief valves, (d) surge tanks, (e) pipe vents, (f) water wheel governors.

There are occasional repetitions of statements, conclusions, and of the meanings of symbols, but this is done for the purpose of making any single chapter complete in itself. Books of this character are seldom read through consecutively, and it wastes the reader's time and patience to search through other parts of a book for meanings.—E. K. S.

CO-OPERATIVE TRADE ABROAD.

We have on several occasions referred to the inquiry that was made a short time ago by the American Federal Trade Commission into the subject of co-operation in the American export trade. Some of the evidence given was distinctly interesting from the electrical standpoint, inasmuch as it set out somewhat fully the measures taken by present enemy industrial organisations for working their way into foreign markets by fair means or by foul. It will be remembered that the anti-trust legislation of the States was held to bar the way to co-operative action by American manufacturers in such a matter. It is hardly likely that this handicap will be allowed long to continue, and proposals for removing it have, we believe, already exercised the minds of American legislators. A complete copy of the report of the Commission is now in possession of the British Department of Commercial Intelligence, and we have no doubt that our electrical manufacturers and those representing their organised associations will find it politic to study the document.

It is recognised that the United States is becoming less and less an agricultural country, and more and more an industrial one, and in order to be prepared to take a larger place in industrial exportation it is necessary that the world situation, and the organised and other practices of other exporting peoples, should be comprehensively studied. This is done in detail in the report. The competitive conditions as they have prevailed in the past, and up against which American traders have found themselves, are examined, and naturally a good deal of attention is devoted to the German Cartels, and the big financial and industrial organisations of Germany and other countries which are found to have assisted their efforts to secure foreign trade receive a good deal of attention. Not without special reason the competitive conditions in South American trade, vast potential markets for decades to come, where German influence, once fostered with such characteristic measures of "penetration," is now on the wane, and where naturally the United States' traders hope for greater things than have been hitherto experienced, have, of course, not been overlooked. But the report goes further than this, for it deals with a number of special industries individually, and discusses the operations of foreign combinations established by them, and the possibility of forming American export combinations to assist these particular industries. Among these specialised lines are electrical manufactures, machinery and rolling stock, blast furnace and rolling-mill products, chemicals, textiles, and so forth. The principal conclusion that is arrived at seems to be that legislative measures must be passed clearing away effectively the present doubts concerning the legality of co-operation abroad on the part of American firms. When this has been effected, it is believed, American exporters will be enabled to compete in foreign markets on more nearly equal terms with foreign competitors.

There is no reason to doubt that after the war the States will be a larger sharer in the export business of the world. For some years undoubtedly there will be ample room for us all, so immense is the mountain of arrears that is accumulating everywhere, and so vast will be the needs for reconstruction or rehabilitation, but we all recognise that a great change has come over the face of industrial manufacturing throughout the entire world. That

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE:—4, LUDGATE HILL, LONDON, E.C. 4.

Telegraphic Address: "AGEEKAY, LONDON." Code, A B C.

Telephone Nos.: City 997; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, £1 1s. 6d.; Canada, £1 8s. 10d. (\$5.80). To all other countries, £1 10s.

being so, we hope that the conclusions of the American Federal Commission, made after so complete a study of the whole subject, in favour of co-operative action will be regarded as an additional signpost for the attention of the British manufacturer. The disposition among our firms to come together, consolidating scattered smaller forces, unifying, and thus making more economical and efficient, their selling organisations, is a very satisfactory feature of the industry to-day. Such measures are necessary in order that our means may be in readiness for immediate operation directly the more propitious times are upon us. We publish on another page to-day some information concerning consolidation efforts made during the war in Germany, though we know that there has been a strong feeling among traders in some departments of industry there is opposition to the movement. Yet we must recognise such consolidation as an accomplished fact, and that these organisations will endeavour for all they are worth, probably with some of the familiar methods of the past, and with others which they consider more suited to enable them to surmount the difficulties consequent upon the antipathy of the greater part of the world, to secure a position of strength. As manufacturing peoples, no doubt they will have their place to fill in world economy. What is needed is that, while there is time, British manufacturers shall take far-sighted action to secure their own position when they come up against the organisations of other countries. Representatives of our Department of Commercial Intelligence have spoken with no uncertain voice on the subject at recently-held meetings at Birmingham, and on Tuesday last at the Engineers' Club at Manchester. We do not know how they could conscientiously do otherwise in presence of all the information that is in their possession in American and German reports.

The merchants have uttered protests, but possibly they have not had an opportunity of considering the facts of this important changing world situation. As we have said before, they will still have their own place to fill as importers and exporters; for many things they cannot be dispensed with now any more than in the past, but they must recognise that with the shaping of new industrial policy, the merchant interest cannot prevent the crying necessity for manufacturers to adopt large specialised measures for bringing into British manufacturing works the business that the world has to offer. Much of such trade, in the engineering world at any rate, may fall away from us if the manufacturer who knows his goods and can best approach his technical buyer is to restrict his co-operative or combination efforts in order to allow the merchants too free a field for action. We have no desire to question the patriotism of merchants as a class—they have done vast good for British trade; but we must not shut our eyes to the changes that have overcome, and are overcoming, industrial affairs in practically all countries. If the merchant were to become as purely British as he can be, and were to act in co-operation with the manufacturers in some way, we do not see why advantage should not be taken of his lengthy and specialised experience of the world markets. Is it impossible for these two valuable forces to run in harness for the industrial benefit of the nation, assisting the nation back to prosperity, and finding work for millions?

The manufacturers in the future will undoubtedly be out to get business for themselves far more than they have been in the past, and, if the Government sees that the world-wide co-operative movement is the right way in which they can be better prepared effectively to meet the coming situation, we do not see why its spokesmen should not say so emphatically, and at so important a British manufacturing centre as Birmingham. Were

they to remain silent in the presence of so many very clear signs on their horizon, they would merit the condemnation of industry, however much they received the commendation of the merchant. Is the duty of the Government trade representatives to be limited to the collection of information, and are they to be precluded from drawing inferences from that information? Heaven forbid! We have preached co-operative effort in these pages too long to regard the Government policy as a mistake. Our counsel has rested upon a good foundation, as present-day movements fully prove. Objections based upon personal and selfish interests, legitimate as those interests are in business, will hardly carry weight with a Government which is laying its plans for future prosperity, any more than they do with us.

THE recent report of the Sub-Committee of the Conjoint Board of Scientific Societies on the application of Science to Agriculture is

a most welcome indication of the extended interest which is being taken in this very important subject. It may be remembered that the Conjoint Board of Scientific Societies was formed last year at the instance of the Council of the Royal Society, mainly with a view to promoting the application of science to industry; its membership includes representatives of 27 prominent societies, which the President of the Royal Society as *ex officio* Chairman. Needless to add, it is a matter for congratulation that amongst the very numerous matters which might claim the attention of the Board, the pressing—nay, vital necessity of reorganising British agricultural methods on scientific lines, has received immediate attention.

The Sub-Committee was constituted specifically "to inquire into and report upon the work at present in progress on the application of science to agriculture, and to make such recommendations as they think fit, with a view to promoting the application of engineering to this subject," and its report, which we reprint elsewhere in our pages, will make pleasant reading for electrical engineers. It is noteworthy that the report is apparently the work of an engineering sub-committee, comprising Sir John Snell, Messrs. A. E. L. Chorlton, F. S. Courtney, and J. Nugent Harris, appointed by the parent Sub-Committee.

The Sub-Committee found—as we ourselves and others have also done—that certain fundamental data were lacking, and "that there appeared to be no Government Department or organisation which possessed this information"; but with the assistance of the Agricultural Organisation Society, it is now in a fair way to secure "valuable data on which to build practical estimates of the power required and costs of operation, and to compare the relative advantages and costs of steam or internal combustion machines and electrically-operated machines." The Sub-Committee states its emphatic belief in the great future which awaits the development of electrical applications to agriculture in this country; its belief that electric power can be distributed to farms at prices which would pay the farmer; its appreciation of the simplicity of electric propulsion for ploughing and other operations, and of utilising a form of power whose source does not involve importation of fuel, &c. The subject of electroculture receives a passing reference, and, finally, it is recommended that an electric tractor, and possibly other agricultural machines, should be designed, constructed, and tested by experienced agricultural and electrical engineers; to this end the Conjoint Board last month unanimously recommended the Board of Agriculture to grant the necessary funds, and to appoint its Agricultural Sub-Committee as an Executive Committee to superintend the work. So

much for the report, the findings of which amply confirm opinions expressed by ourselves in these columns during the past few years, and are the more interesting because the Sub-Committee is representative of "engineering" as distinguished from electricity supply.

An independent and essentially advisory body such as the Conjoint Board of Scientific Societies can render inestimable service in shaping the future of British agriculture along economic lines. With all due respect to our agricultural experts, it is abundantly evident that the basic question of making the land produce the nation's food at the cheapest possible cost has still to be answered, and the general policy to be pursued in regard thereto to be defined. This this may involve a complete transformation of agricultural methods is a foregone conclusion, for if farming is to be no more a hobby, as in the past, but is to become in truth the master-key industry that it should be, then the co-operation of the engineer, the chemist, and the business organiser will be indispensable, efficiency will necessarily be the order of the day, and efficiency means machinery and, if necessary, methods adapted to the use of machinery, instead of the reverse. A general survey and pronouncement on the primary factors essential to the development of our agricultural industry to meet the needs of the nation is badly needed, and would lay the foundation for successful progress; and, having in view the necessarily scientific nature of such development, it appears to us that the Conjoint Board, with its independent standing, could well undertake this work, which would in effect co-ordinate the various efforts towards the industrial reconstruction of agriculture.

The problem is no mean one; it amounts roughly to the trebling—if that be possible—of the output of our farms with the minimum of additional labour, and, of course, presupposes the use of machinery wherever possible. It is mainly an engineering problem.

RESEARCH ORGANISATION.

By D. ROSS KENNEDY.

There seems to be room in the industrial world for three methods of financing research. There is research which the individual firm finds it remunerative to undertake at its own expense. Secondly, there is research which is financed on a co-operative basis; and, lastly, there is research which must be financed by the State if it is to be done at all.

Is any distinction in kind to be drawn between these three classes of research which would justify this difference of treatment? (Page 16.)

We have given considerable thought during this year to the question of encouraging inventors. The problem is undoubtedly one of great importance, but it is also one of great difficulty. (Page 42.)

(Report of the Advisory Council on Scientific and Industrial Research, 1916-17.)

For the answer to the question in the first quotation, the Advisory Council has sought in the correct direction, and concludes that the third class is to be identified by the fundamental character of its results; and, in keeping with the general tenor of the report, it is fundamental scientific research which is to be so distinguished.

But if *practical research* be substituted for scientific research, then a much more appropriate distinction will be provided, and, at the same time, a solution will be given to the difficult problem in the second quotation. Practical research is the one which should form the third class, and is one which requires State aid to a far greater degree than any other class of research work.

The neglect of practical research in the proposed research organisation is to be explained by the fact that the organisers believe that

It has been the co-operation of progressive industry with science which has led to the practical application of the results obtained in the laboratories of scientific men.

This is not the case; at least, not in the engineering industry, where the practical application of the results of

scientific research is due to practical research, which forms the true link between science and industry.

When the scientific research has been successfully accomplished, it still remains to devise means whereby the results of the investigation may be usefully employed for the benefit of civilisation, and so the inventor takes up the task, and by means of practical research guides the issue of scientific research into a channel of industrial utility. And it is by practical research that the industrial design of an invention is evolved and the lines are indicated along which the industrial production must proceed to be commercially efficient. Before "progressive industry" will consider the merits of an invention, in a great many cases the inventor has to carry through this work.

The Trade Research Associations advocated in the Report will be of very little help to the individual inventor. Large engineering establishments have, as a rule, inventors on their staffs, and although facilities exist for conducting practical research to the highest degree, these are, unfortunately, utilised on a small scale only for improvements in design. Manufacturers have the reputation, and not without cause, of discouraging inventors with fundamental revolutionary ideas. There is some reason, however, for this reactionary attitude from the point of view of the manufacturer who has sunk large sums of money in the development and production of a standard article, which to a great extent would be lost if drastic changes were effected.

There is little need to enumerate the many engineering inventions which have helped to build up our civilisation, and which were due to the tenacity of purpose of a private inventor struggling against adverse circumstances of a nature quite apart from the problems of practical research, on which his every effort should have been concentrated. Having proved the worth of his invention, the inventor sinks into obscurity, whilst the organisers of industry reap the benefit. On the other hand, successful workers in scientific research have their labours amply rewarded, and their fame lives for ever in the text-books.

Scientific research has always been the child of fortune, reared in the elaborate laboratory of an educational institution; its development carefully fostered by indulgent professors, free from mental distractions caused by financial embarrassments, and with numerous assistants paying for the honour of participating in the work. And now scientific research is provided with an affluent State apartment, wears a massive gold Albert, and has industry for its valet.

Practical research has never been a favourite in the educational institution—due, no doubt, to the fact that practical experience and technical skill are necessary to its development. The garret, cellar, or outhouse has been its normal environment, and it has only enjoyed spasmodic opulence when adopted by wealthy experimenters or inventors with adequate financial support, exceptions which only go to prove to what extent the inherent strength of practical research could be developed if it enjoyed the same, or even a part of the prosperity that is thrust upon scientific research.

If the private inventor is still to struggle on with the scope for practical research restricted, and its growth stunted, for lack of suitable nourishment, then the period which elapses between successful scientific research and its practical application to industry will still be unnecessarily prolonged. Instances could be multiplied where well-known present-day productions of the engineering industry have been years in the process of practical research, whereas if similar facilities had existed as for scientific research their beneficial effects would have been enjoyed much earlier.

Is the internal-combustion turbine to languish for years like the steam turbine, until the accidental advent of an inventor possessed of the rare combination of engineering genius, independent financial means, and enthusiasm for work, proves its practicability?

If less time be lost between the completion of the scientific investigation and the ultimate development of an industrial production through practical research, then, instead of labour waiting on industry, industry would be seeking labour, wherein lies the solution of some perplexing problems facing labour and finance.

In the light of an experience of upwards of ten years in practical research work, electrical and mechanical, the suggestion cannot be accepted that the industrial research for

which facilities are being provided is synonymous with practical research. Truly, on page 13 of the Report, an indirect reference is made to practical research:—

In suitable cases the Department are also prepared to consider applications for assistance towards researches necessary to perfect for commercial use patented or protected inventions or processes.

But where is the organisation necessary for efficiently applying the assistance?

To the practical research worker, the experimental workshop is the equivalent to the scientific research-worker's laboratory. Scientific laboratories abound throughout the country. The organisation for practical research should provide for the establishment of experimental workshops in suitable centres. Where training workshops exist in technical colleges and universities, they should be thrown open to the practical research worker, and organised as much for his benefit as for the scholars'. The worker in practical research would then enjoy the same opportunities as the professors, and could command free assistance from students, whilst the practical experience the students would obtain would be a valuable addition to their technical training.

The organisation of experimental workshops would also require to include paid assistance, and for this purpose it would not be feasible to employ the staff which has been organised for scientific research. It is only in exceptional cases that scientific abilities are combined with engineering skill. The ability to produce scientific research of a high character is seldom accompanied by the training, skill, and engineering insight, coupled with genius for design, which successful practical research calls for.

The investigator who works alone on practical research must be highly accomplished in the mechanical arts. He must have the combined experience of the designer, pattern maker, turner, fitter, and tester, and he must also have experience in adapting existing material to the construction of apparatus for making preliminary tests, and be capable of appreciating the results of these tests. The scheme for scientific research indicates that provision is to be made to include the worker in the organisation, but, from the above, it will be seen that practical research affords the better opportunities for the co-operation of skilled labour. The skilled workman can understand and appreciate practical investigation, but how would a worker, say, with experience in constructing electric generators, participate beneficially in the scientific investigation of the hysteresis loss in magnetic material and the determination of the magnetisation curves? On the other hand, the co-operation of this worker would be invaluable in practical research work such as is necessary to develop, say, the homopolar electric generator. In the organisation of the experimental workshop the necessary skilled labour would be included as paid assistance.

In addition to financial assistance and the establishment of experimental workshops, a central technical advisory office is essential to practical research organisation. Many inventions are delayed in development, and others lost altogether, through the inventor's lack of technical training, and often the practical research fails for want of correct design. A properly organised technical advisory office would afford assistance in the necessary calculations and design for experimental models, and thus, in many cases, relieve practical research from the burden of an injurious handicap.

When the organisation of the present scheme is extended to include some such organisation for practical research as outlined above, then the results of scientific investigation will be systematically analysed and tested for their industrial destination with a minimum of delay, and then organised research will achieve its object and its innovation be justified.

BRITISH STANDARDS FOR ELECTRICAL MACHINERY.

THE revised "British Standardisation Rules for Electrical Machinery" (excluding motors for traction purposes), No. 72—1917, issued by the British Engineering Standards Committee, and dated September, 1917, present several interesting departures from what has been the Committee's standard practice. The new format of the rules—octavo,

printed on both sides of the paper—will at once commend itself to those who have occasion to consult its pages, whose numbers, moreover, will be greatly increased by the welcome reduction of the price from 10s. 6d. to 1s., made possible by the Government contribution to the funds of the Committee. The announcements that all the specifications will in future be issued in this form and at this price, and that translations into foreign languages will shortly be ready for issue, are also very satisfactory, and bear witness to the progressive spirit by which the Committee is animated.

In our issues of December 10th and 24th, 1915, we reviewed at some length the specification No. 72 dated October, 1915, of which the present issue is the first revision. We, therefore, need only refer to the changes which have been made, as the result of a conference with the Standards Committee of the American Institute of Electrical Engineers in March, 1916, at which the British Committee was represented by Mr. le Maistre, the secretary.

An introduction has been provided setting forth the object of the Rules and explaining their use, and the Appendix giving instructions as to the information that should be furnished when inquiring about or ordering electrical machines has been made Section I.

The standard pressures for motors are now placed with the standard frequency and phases in Section III, and include 460 volts. The "types" of generators and motors have been revised, "open" being replaced by "open pedestal" and "open end-bracket," "protected" being more fully defined, and "enclosed ventilated" being substituted for "semi-enclosed," while the maximum area of the apertures in the perforated covers is increased from $\frac{1}{4}$ to $\frac{1}{2}$ sq. in. The next noteworthy alteration is the permission (Clause 68, formerly Clause 57) to ascertain the temperature of shunt or separately-excited field coils by thermometer if it can be shown that the temperature as determined by the resistance method would not have exceeded the permissible limit—subject, as before, to a penalty of 5° C. A large part of Section IX (now Section X) dealing with the use of embedded temperature detectors is cut out, without materially affecting the requirements.

Considerable changes have been made in Section XIII on "Excess Current and Torque Tests" (formerly Section XII, "Tests for Mechanical Strength and Stalling Torque"). The excess current test for machines with "continuous" rating is reduced from 100 to 50 per cent. The stalling-torque test for induction motors so rated is not to apply to machines of abnormally low speeds or high frequencies, and consequently low power factor. Shunt motors for intermittent service are exempted from the requirement that they shall exert a starting torque on test 100 per cent. in excess of the value corresponding to their rating.

The table of high-pressure tests on dielectrics has been radically amended; all machines above 1 H.P. are to be tested with twice rated pressure + 1,000 volts. For separately excited rotating field windings the maximum test pressure is fixed at 3,500 volts. A special test (Clause 96) is prescribed for a machine which has been out of service for some time—namely, 75 per cent. of the pressure applied to a new machine. Current and pressure transformers are omitted from the table, being covered in another Specification. The stipulation that the insulation resistance shall not be less than 1 megohm is removed. The complicated alternative "Duration of High-Pressure Test" (old Clause 83) has been dropped, leaving one minute's electrification as the only standard; old Clause 84, relating to "Discharge During Test," has also gone.

A new item to be stated on the rating plate of an induction motor is the rotor current.

We may add that in many places verbal alterations have been made, which clarify the style without affecting the sense of the text. It is interesting to note that the rather ugly I.E.C. symbol for kilowatt (kW) employed in the previous edition has been replaced by the form KW. As a whole, the new style of specification represents a very marked improvement on its predecessors, which, owing to the mode of binding, the large pages, and the comparatively enormous bulk and weight, were by no means convenient to handle. The new edition weighs 3½ oz.—the old one, 17 oz.

ASSOCIATION OF MUNICIPAL ELECTRICAL ENGINEERS (UNION OF SOUTH AFRICA).

THE second annual Convention of the Association of Municipal Electrical Engineers (Union of South Africa) was held at Durban from August 27th to September 1st, and was attended by members and Councillors from the various parts of the Union.

An official welcome was given to the Association on the opening day by the Mayor of Durban, after which the annual general meeting was held for the election of officers and the transaction of business.

Mr. John Roberts (Durban) was elected president, and Mr. B. Sankey (Port Elizabeth) vice-president.

The members of Council elected were:—Col. Dobson, D.S.O. (Johannesburg), past president; Mr. T. Wolley-Dodd (Pretoria), Mr. W. Bellad-Ellis (Queenstown), Mr. T. Jagger (Ladysmith), and Mr. G. A. Stewart (Bloemfontein).

On Wednesday a visit was paid to Pietermaritzburg, where, at the invitation of the Mayor, members were entertained to lunch. A very interesting lecture was given during the day by Mr. J. W. Kirkland, of Johannesburg, on "Railway Electrification"; the basis of the lecture was the Chicago, Milwaukee and St. Paul Railway of America, the aim of the lecture being to show how electrification could be advantageously adopted in South Africa.

On Thursday a paper on "Standardisation" was read by Mr. John Roberts, and the discussion led to some important recommendations being arrived at for submission to the South African Standards Committee now sitting in Johannesburg.

In the evening, on the invitation of the engineering section of the Natal Society for the Advancement of Science and Art, the members of the Convention attended the first annual dinner of that society, and there were about one hundred present.

On Friday further discussion took place on "Tariffs."

A. S. Munro (Pietermaritzburg).		R. A. Stoker (Kroonstad).		G. H. Swingler (Cape Town).		C. J. Everatt (Johannesburg).		Councillor Hopper (Cape Town).		P. J. Gold (Benoni).	
Member of Council.											
T. Miller (Harrismith).		Councillor Gilbert (Harrismith).		H. Brittle (Cradock).		T. Jagger (Ladysmith).		Councillor Francis (Bethlehem).		Councillor Hudson (Port Elizabeth).	
M. McDonough (Bethlehem).		G. A. Stewart (Bloemfontein).		Councillor Payne (Durban).							
Hon. Sec. & Treas. E. Poole (Durban).		Mem. of Council. T. Wolley-Dodd (Pretoria).		Mem. of Council. Col. Dobson, D.S.O. (Johannesburg).		President. John Roberts (Durban).		Vice-president. B. Sankey (Port Elizabeth).		Mem. of Council. W. Bellad-Ellis (Queenstown).	
Coun. Crawford (Bloemfontein).		Coun. Birschoff (Pretoria).		W. H. Blatchford (Greytown).							

MEMBERS AND DELEGATES AT THE SECOND ANNUAL CONVENTION OF THE ASSOCIATION OF MUNICIPAL ELECTRICAL ENGINEERS (S.A.E.) HELD AT DURBAN, AUGUST 27TH TO SEPTEMBER 1ST, 1917.

Mr. E. Poole (Durban) was elected secretary and treasurer. It was resolved to hold the next Convention at Port Elizabeth.

At the conclusion of the business meeting, the Mayor gave an official luncheon to the members at the Royal Hotel, and in the afternoon a visit was paid to the soap works of Messrs. Lever Bros.

On Tuesday the president delivered his address, after which an interesting discussion took place on Mr. John Roberts's paper on "Tariffs," which was held over from the previous Convention. In the afternoon visits were paid to the electric power station at Durban, the tramway department, and the municipal telephone exchange. In the evening, by invitation of the engineering section of the Natal Society for the Advancement of Science and Art, members attended a meeting at which a paper on "Municipal Electrical Undertakings in South Africa" was given by Mr. E. Poole, assistant electrical engineer to the Durban Corporation.*

* Abstracted in the ELECTRICAL REVIEW, October 5th and 12th, 1917.

and important resolutions were adopted for circulation amongst all South African municipalities. The appropriation of net profits from undertakings for the relief of rates was very strongly condemned.

The next paper was by Mr. E. J. Hamlin on "The Design, Operation and Management of Small Electric Power Stations."

The Convention closed with appreciative remarks by the various Councillors of the municipalities represented, who spoke of the great help the Convention had been to them.

Address by Mr. John Roberts, President.

(Abstract.)

We must place on record the satisfaction we must all feel at the very worthy part played in the sphere of military affairs by our past president, Lieut.-Col. Dobson, who 15 months ago left for German East Africa in charge of a regiment of pioneers of his own raising, and who, after about six months' service in the field, returned crowned with honours and his present high rank. It must reflect credit on us as his colleagues that our past president should have

demonstrated so well the usefulness of the electrical engineer in modern warfare, and we thank him accordingly, and congratulate him heartily on an achievement which he will probably rank higher during the rest of his career than any thing else he has done.

When the war is over the engineer, and particularly the electrical engineer, will be looked to to perform the many and much-needed tasks of reconstruction to make good the fearful devastation which has been brought about. New schemes of development, particularly in the Colonies, are completely arrested until the war is over. In our own country the Rand Water Board has postponed a gigantic scheme to carry water from the Vaal to the Rand. The Johannesburg municipal electrical scheme has two large turbines to install which cannot be delivered. The Capetown Municipality has a large water as well as a sewerage scheme in abeyance. Pietermaritzburg has hung up large extensions to its electricity undertaking. In Durban large projects for the establishment of industries, such as cement and soap making, were postponed when war broke out.

A committee of technical experts has been appointed to study the possibilities of new industries in South Africa, with Mr. Bernard Price, chief engineer of the Victoria Falls Power Co., as the chairman. I am sure that great good will result from that committee's labours, for the possibilities are tremendous.

The work of the electrical engineer is bound to be intimately associated with the development of South Africa. The day is not far distant in England when the generation of power will be done in mammoth stations, and the small towns will give up their small, inefficient stations. But in South Africa it will be many years before the towns will be linked together into one common network, though it is bound to come one day, and for some time yet every town must be responsible for the supply of current within and around its borders.

Knowing, as we all do, the stimulation to industry which a good local supply of electricity brings about, it follows that municipal electrical engineers must wake up to their responsibilities to local industries, and place themselves in a position to meet any reasonable demand for power which may be suggested in their territory. By such a policy they may be able to promote local industries which otherwise may be driven to larger centres of population where a supply of current can be secured.

Wattle-bark, up to the breaking out of war, was exported as it was stripped from the tree. It would be much more sensible to export the extract instead of the bark, thus saving considerably in freight and yielding the tanning product locally, which would undoubtedly tend to the quicker establishment of an industry to turn our hides into leather. Such an extraction plant will soon be in operation near Durban. But why not up-country, where the bark is grown? It will rest greatly with municipal electrical engineers to induce manufacturers to manufacture as near the seat of agriculture as possible, instead of railing the raw material to the large towns to be manufactured there. Other cases could be quoted.

It is not out of place, therefore, to call your attention to the necessity of a careful study of the possibilities of the establishment of local industries in your respective territories. In many cases you will have to study the manufacturing conditions closely in order to put yourselves in a position to advise as to the best way to apply electricity. Usually the owner is not acquainted with the electric drive, and one has to know sufficient of his work to demonstrate not only how to solve the power problem, but to show in what way electricity will be superior to steam. In Durban, we have found it necessary to get some acquaintance with a number of widely different industries.

As we municipal electrical engineers stand as the exponents of electrical enterprise, we must keep before the farmer the advantages of electricity, especially in irrigation work, and should make ourselves acquainted with the immense work done in this direction in the Western United States, where vast tracts of arid deserts have been made to blossom by water pumped by electric power. And everyone in his territory must be a missionary spreading the doctrine of "electricity for the farmer." One's efforts should not be confined to those within reach of the mains; one may recommend a farmer to put in his own little plant, and then, when his example has been followed by his neighbours, a demand for current will be created sufficient to warrant taking lines out to shut up the isolated plants.

As a result of the great progress the farmer is making in cattle raising, the meat industry is looming up, and there can be no doubt that our limitless veldt will produce meat in quantities comparable with what the Argentine is doing. A large export of meat will bring with it the possibilities of many new industries, and every live electrical engineer must get into a position to cater for demands for power which may arise in connection with these. The number of mills for crushing and milling maize is likely to increase, and a flour mill should be an excellent customer for power. Frequently they run for 24 hours per day, and preferential terms could be offered.

The small station should be so designed as to be able to deal with demands for power at moderate charges. The total cost in the small undertaking is high in most cases because the standing charges are excessive, due to the small produc-

tion, but this cost would automatically fall if the output could be brought up, for instance, by the addition of a good power load. But in some cases the variable costs, principally fuel, are also high, and this high figure per unit will not go down much with addition of load. The aim must be to lower fuel and repairs cost to the minimum, so that by increasing the output the total cost will not increase much, due, of course, to the standing charges remaining fixed. To secure such a state of things it is useless to run a plant with non-condensing steam engines, even where coal is cheap.

I do not think that the Diesel engine is the right solution. The fact that one has to depend on fuel from overseas is sufficient to condemn it. I am surprised that the gas engine has received such comparatively small support from the municipal electrical engineer of the small town.

Standardisation is in the air all over the world, and the need of more uniformity in all branches of engineering than now exists is really very pressing. We shall place the electrical industry under a debt of gratitude to us if we can do something to reduce the great and unnecessary variety of plant and apparatus which now has to be stocked. We happen to have a great opportunity before us at the present time. A few months ago the Natal Engineering Society made representations to the South African Institute of Electrical Engineers in regard to general engineering standardisation. It then appeared that a Standardisation Committee had been in existence in Johannesburg for many years past, but for some time its activities had been suspended. The representations we made roused considerable interest, and the outcome was that a new committee was got together, in Johannesburg in May last, and Mr. F. W. Mills, chief railway electrical engineer, was appointed chairman. I trust that at our convention we shall have time to give the matter of standardisation, both of systems and supplies, considerable attention.

This important question is brought into prominence at the present time owing to a most interesting development in the railway policy of South Africa which is foreshadowed by the general manager, Sir Wm. Hoy, in his last annual report. That progressive administrator is thoroughly alive to the benefits which the large railway system he controls would derive by the introduction of electricity instead of steam as the motive power not only for suburban but for main-line trains.

We are closely interested in the subject because the South African railways have (under the advice of Mr. F. W. Mills) given up generating current for themselves, and now in all the principal towns of the country take their supplies of electricity from the local municipal plants. It follows that when the time comes, as I believe it will at no distant date, when the administration must consider supplies of electricity on a large scale for railway power, the municipalities will be given an opportunity of submitting propositions for such a supply. Within the next few years, therefore, some understanding between the municipalities should be come to as to the terms which should be offered, class of current supplied, &c.

Many of us are carrying out our work under arduous conditions in these trying war times. The ranks of engineering artisans have been depleted more than those of most businesses owing to the great demands for engineers made by the war, and the war has indirectly brought about great engineering activity in peaceful employments because we have been called on to make locally many things we used to import, owing to shipping difficulties and prohibitions on export.

In Durban, owing to local supplies of cement the cost of concrete has not advanced much, and we have adopted in certain instances concrete poles in place of steel or cast-iron.

Distribution lines and cables are one of the most difficult class of supplies. We have gone over our distribution plans very carefully to discover where copper is in excess, and have taken down one long overhead high-tension line and made up from it three shorter lines to feed the central district, and are recovering a good deal of underground cable, which will come in for low-tension distribution. We are also taking down ground wires which we regularly employed above all high and low-tension overhead conductors, as we are doubtful if these are of the value we used to think they were. This will yield us considerable quantities of bare copper wire for small extensions of our lines. Fortunately, the new demands from large consumers of power are not coming in fast, as such consumers cannot obtain machinery for new enterprises.

Meters at the present time are very difficult to obtain, and we are putting into service a number of old types of meters we took down as being obsolete, but which we kept in reserve for unforeseen emergencies; they are coming in very useful now.

We have had to do quite a lot of constructional work both in the power station and outside, and owing to the high price of steel sections of all kinds we have very largely used old steel tram-rails for all kinds of work—generally in combination with concrete. We have built up switchboards with these rails as a framework, using asbestos "Eternit" or similar sheeting as coverings and as partitions. Latterly we have been bringing in old boiler tubes as uprights for switchboard panels. Though the general appearance is not so good, it must not be thought that the results so far as reliability goes are any worse; in fact, we have aimed at doing better work than usual now, as it is important to reduce maintenance costs on account of the shortage of skilled attendance.

We have planned to build a new condensing water pipe line of reinforced concrete pipes 21 in. in diameter. The local cement, though slow in setting qualities, gives quite satisfactory reinforced concrete results. Speaking generally, it is wonderful what can be done when one is thrown on one's own resources. Scrap heaps should be carefully sorted over and the materials classified, and much old stuff which it would not have been profitable to use before is now worth money.

We are using old short lengths of trolley wire, bound together, as switchboard bus-bars, and in some cases are putting this up in place of heavy bus-bars, which can thus be taken down and used elsewhere. It is a great satisfaction to know that porcelain insulators are now made in the Transvaal.

Enclosing globes for street lighting are very scarce, but we are discarding these in some cases, and do not find much disadvantage.

At the convention resolutions were adopted stating that all charges arising between different departments of a municipality should be based on standard tariff charges where such exist, and in the absence of such standard charges, should be based on the net cost of services given or received; that in the opinion of the Convention it is unsound policy, as militating against the successful financial operation of municipally-owned electricity undertakings, to allocate net surplus profits for the relief of rates or for municipal funds, or to make indirect charges so as to unfairly reduce net surplus profits; that the rapid introduction of new and improved machinery for the production of electricity renders it imperative that every electricity undertaking shall set aside out of its net surplus profits an adequate amount to write off obsolete plant; and that the only legitimate outlets for net surplus profits are the building-up of an ample obsolescence fund, and the reduction of the charges to the consumer in order to encourage the use of electricity.

On the suggestion of Mr. Poole, it was resolved that the various municipalities be invited to furnish the secretary with a schedule of obsolete electrical stocks, with a view to such stocks being exchanged or bought where a demand exists, the prices of such stocks to be those existing before the outbreak of war.

The following important recommendations were made in regard to standards, and were transmitted to the South African Standards Committee sitting in Johannesburg:—

STANDARDS AGREED.

1. Current ... Alternating.
2. Periodicity ... 50 cycles per second.
3. Number of phases ... Three.
4. Generating pressures ... 415, 3,300, and 6,600 volts.
5. Supply pressures ... 240 and 480 volts three-wire, 240 and 415 A.C. four-wire.
6. System of distribution ... Four-wire, three-phase.
7. Transmission pressures ... 3,300, 6,600, and 11,000 volts.

Bare Conductors for Overhead Lines.—Nos. 12, 10, 8, 6 S.W.G., and beyond these sizes, the same sizes laid down by the British Engineering Standards Committee, but with the deletion of the following sizes:—.125, .25, .35, leaving .05, .075, .1, .15, .2, .3, .4, and .5 sq. in.

Underground Mains.—On the types of cables, it was decided to recommend that the system of protection adopted be uniform, viz., that the cables should be armoured suitable for laying direct in the ground, the sizes of conductors to be similar to those recommended by the British Engineering Standards Committee, with the deletion of the same sizes referred to in the bare conductors for overhead mains, leaving the sizes for adoption as follows:—.05, .075, .1, .15, .2, .3, .4, and .5 sq. in.

It was also resolved to recommend that, as it was desirable that the various kinds of mains in use should be readily distinguishable from the outside without cutting the cable, makers should be asked for suggestions in regard to this matter, such as by varying the width of the standard tapes, or by introducing a steel wire or wires in the jute serving, commonly used over the armouring.

Meters.—That two two-wire meters be adopted for use on low-tension supplies in preference to three-wire meters. Sizes:—3, 5, 10, 25, 50, and 100 amperes.

Plugs for Heating and other Circuits.—This matter was referred to the Council to decide upon certain standards as regards sizes, dimensions, &c.

An Electric War Boat.—The Secretary of the Admiralty on Saturday issued the following statement:—

"An attack was made to-day on our vessels patrolling the Belgian coast by an electrically-controlled high-speed boat. The attack was defeated, and the boat destroyed."

Various methods of controlling boats, aircraft, &c., from a distance by wireless transmission, or by sound waves, have been described in our pages; none of them advanced beyond the experimental stage, but perhaps the Germans are trying to develop some such system on a practical scale.

The *Times* states that four such boats have already been destroyed; they are propelled by petrol engines, electrically controlled from the shore, and conveyed by aeroplanes. The Admiralty regards them as "freak vessels."

THE ENGINEER AND AGRICULTURE.

The report of the Sub-Committee of the Conjoint Board of Scientific Societies on the Application of Science to Agriculture, which has been recently issued, reads as follows:

This Sub-Committee was constituted "to inquire into and report upon the work at present in progress on the application of science to agriculture, and to make such recommendations as they think fit with a view to promoting the application of engineering to this subject."

The Sub-Committee comprised the following members: Lord Portsmouth (chairman and convener), Mr. A. E. L. Chorlton, Mr. A. D. Hall, and Sir John Snell. To these names the Executive Committee added Dr. J. A. Voelcker and Captain J. Bell White, R.N.R., the representatives of the Agricultural Society, and the Agricultural Organisation Society nominated the Rt. Hon. F. Dyke Acland and Mr. J. Nugent Harris. The Sub-Committee has held three meetings, and has co-opted Mr. F. S. Courtney to assist it in relation to engineering problems.

The Sub-Committee decided that certain fundamental data were required, and that there appeared to be no Government department or organisation which possessed this information.

A sub-committee was therefore appointed consisting of Sir John Snell, Messrs. Courtney, Chorlton, and Nugent Harris, to obtain the necessary information. A series of questions has been issued to various experienced authorities, and some most valuable and comprehensive replies have been returned.

Through the help of the Agricultural Organisation Society a careful census is now being taken in districts where there are various classes of agriculture. The object is to ascertain the amount of produce sent out from, and the raw materials conveyed to, these districts, and the times when such transport is effected; also the times occupied in seasonal operations on the land, whether ploughing, harrowing and cultivating, or reaping and threshing, and certain stationary operations. It is hoped from this detailed information to obtain valuable data on which to build practical estimates of the power required and costs of operation, and to compare the relative advantages and costs of steam or internal combustion machines and electrically-operated machines.

It is proposed also to report on the methods of transit and transport, possible co-operation, especially in the establishment of necessary repair sheds, tools, and skilled mechanics, and to endeavour to suggest practical standards of machines of various kinds.

Such an investigation must, from its nature, take some considerable time, but the Committee hopes to progress rapidly once the fundamental information and seasonal diagrams are available.

The Engineering Sub-Committee, after careful deliberation, has come to the conclusion that it cannot help effectively in the development of internal combustion engine-driven tractors, and for this reason: The Government have already put in hand many thousands of tractors, and practical application of so many various types of tractor must inevitably lead, by a process of trial and error, to a speedy evolution of types most suitable for the various conditions of soil and climate. Reasonable standardisation must also follow as a matter of course.

The Sub-Committee, however, emphatically believes that a great future awaits the development of electrical applications to agriculture in this country. While, on the one hand, in Germany enormous developments have taken place in agricultural districts, and farmers have increasingly utilised electric power, not only for stationary motor purposes, such as threshing, grist mills, and cream separation, but also for ploughing, cultivating, and hoeing; on the other hand, in this country, it must unhappily be said that no applications of electricity to agricultural purposes beyond that of the farmstead have been made. This position, no doubt, largely arises from the fact that practically no electricity has been as yet distributed in agricultural districts.

A Departmental Committee of the Board of Trade on Electric Power Supply has been sitting for some months past, and it is probable that wider powers of distribution will be granted in the near future, and that cheap power will be available for transmission, not only to industrial districts, but also, should the demand arise, to agricultural districts.

In the Report to the Board of Agriculture on "Agricultural Credit and Agricultural Co-operation in Germany" (Cd. 6,626) it is stated that in 1913, electrical power was already being utilised by large landowners to a remarkable extent, and that its use had been stimulated by the marked increase in the employment of both large and small agricultural machinery. Electricity was then extensively employed, especially for driving threshing machinery, hoes and cultivators, grist mills, cream separators, &c., and it was anticipated that electrically-driven ploughs would increase considerably in number. There are already several different designs of electric ploughs in use, but they are said to be expensive in first cost, and in Germany, on this account, they were then only considered profitable for farming areas of about 1,500 acres and over, and were only procurable by large owners or combinations of small owners. The report says that electrical ploughs "are stated to be more advantageous than steam ploughs, and that the use of machinery has been

stimulated by the dearth of farm hands, and not only has the introduction of electrically-driven machinery partially met this need, but it has also made the task of very small farmers less strenuous."

The report also says that "apart from the advantage of saving or replacing labour, electricity is advantageous to farmers through the low cost of maintenance of the electrical apparatus, the absence of running expense when not being utilised, the rapidity with which it can be put in operation, its simplicity for handling, the facility with which the motor can be applied to the working of several machines simultaneously, its precision, its cleanliness, its freedom from

THE TEMPERATURE CONTROL SYSTEM IN THE CHARING CROSS HOSPITAL.

THE necessity of maintaining an equable temperature in hospital wards will immediately be recognised, and any method of accurately and conveniently measuring the temperatures of the various wards throughout the building is of importance as a means to this end.

A short description of the system of temperature control employed in the Charing Cross Hospital will therefore be of interest. In this hospital the thermometers fixed in the wards each consist of a coil of platinum wire, suitably protected, forming the bulb of a platinum

FIG. 1. GEORGE DRUMMOND WARD, CHARING CROSS HOSPITAL.

FIG. 2. SWITCHBOARD IN KITCHEN.

danger of fire, and, under normal conditions, its comparative cheapness."

The Sub-Committee believes that electric power can be distributed to farms at prices which would pay the farmer. There is no question as to the economy of electric motors for stationary purposes, and the important matter which requires practical experiment and proof is the application of electricity to ploughing and cultivation, reaping and binding, &c.

An electrically-propelled plough or other agricultural machine would be both simpler in construction and easier to handle, inspect, and repair than an oil-driven machine. There would be no need for the source of power (i.e., coal or the change of speed and speed control is greatly easier, and the protection of motors and reduction gear from dust and dirt can be made absolute.

A national advantage would lie in the use of electrically worked implements as the source of power (i.e., coal or water) is in the country, whereas oil would generally have to be imported for the larger internal-combustion motors.

Electricity may also be used for intensive cultivation. Experiments have already been made on a reasonably extensive scale which go to show that, *ceteris paribus*, there is an increased yield when high-pressure electricity is discharged above the cultivated area. Further research is required in this important matter.

The Engineering Sub-Committee recommends that arrangements should be made with an experienced agricultural implement manufacturer, and an experienced electrical plant manufacturer to design, construct, and test practically an electrical tractor, and possibly other agricultural machines.

A resolution of the Conjoint Board was made unanimously on October 10th, 1917, as under:—

"The Conjoint Board recommend that the Board of Agriculture be asked to grant the necessary funds for designing, constructing, and testing practically an electrical tractor and certain other agricultural machines, and to appoint the Agricultural Sub-Committee (for some of its members) as an Executive Committee, to superintend the designing, building, and testing of such plant, and to prepare a report thereon."

resistance thermometer and connected by ordinary copper leads to a indicating switchboard erected in the engineer's office. One of these thermometers is indicated by an arrow in fig. 1. All the thermometers from the various wards are wired to a single switchboard, and by means of a plug connection any required thermometer can be connected to the indicator, which is calibrated to give direct readings of temperature. By this means the tempera-

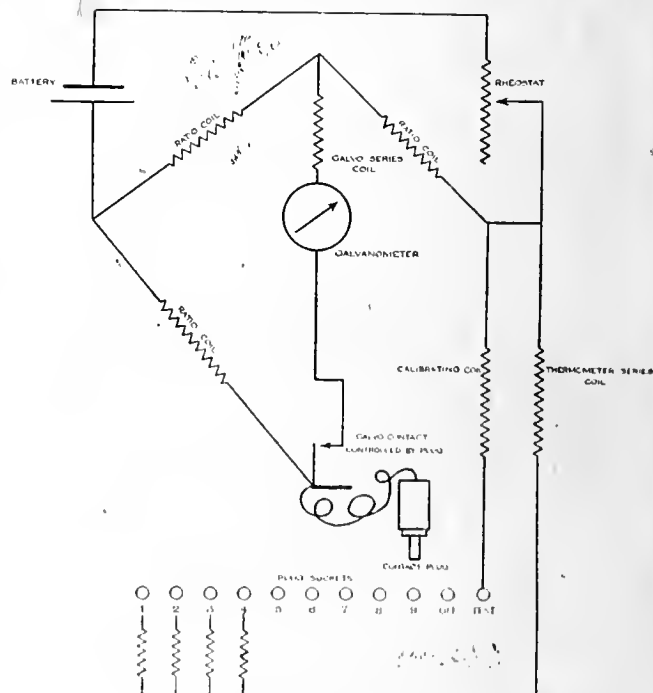

FIG. 3. DIAGRAM OF CONNECTIONS.

tures in all the wards are easily determined at regular intervals, and the saving in time and labour effected by such a centralised system is obvious.

In the kitchen of the hospital a similar installation of thermometers is employed for measuring the temperatures in milk sterilisers and gas ovens. Fig. 2 illustrates the switchboard belonging to the kitchen installation.

As will be seen from the diagram of connections given in fig. 3, the instruments operate on the Wheatstone bridge principle, the bridge being balanced at the zero position of the indicator and the

The Electrical Sterilisation of Milk.—The process by which milk is efficiently sterilised with the aid of alternating current, without affecting its taste, composition, or nutritive qualities, at one of the milk depots of the Liverpool Corporation, under the supervision of Prof. J. M. Beattie, was described in a recent issue of the *Practitioner*. As we have received inquiries lately on this subject, we may mention that a full illustrated description of the process appeared in our issue of July 31st, 1914.

deflections being caused by the current which passes through the galvanometer coil when a change in the temperature of the thermometer throws the bridge out of balance. The current necessary to operate the thermometers is supplied by a 1-volt accumulator. In addition to the various thermometer switches on the board, there is a switch marked "test," and when the plug is inserted in this switch the pointer of the indicator is deflected to a certain position marked on the scale if the instrument is in correct adjustment. A means is provided of readily compensating for any variations caused by a fall in the voltage of the accumulator.

In addition to the two sets of electrical thermometers, the Charing Cross Hospital has also installed a number of H. and M. mercury-in-steel recording thermometers for giving continuous records of water, steam, and flue-gas temperatures at various points in the heating system. One of the instruments also serves to record

FIG. 4. TEMPERATURE AND PRESSURE RECORDERS, AND THERMOMETER SWITCHBOARD.

the steam pressure in this system. A view of these temperature and pressure recorders, together with the distance thermometer switchboard for taking ward temperatures, is given in fig. 4. The recording thermometers have each a steel bulb placed at the point where the temperature is to be determined and connected by the requisite length of steel capillary tubing to a Bourdon spiral fixed behind the dial of the recorder. The bulb, capillary tubing and spiral are filled with mercury, and changes of temperature in the bulb give rise to corresponding changes of pressure inside the instrument, these being magnified and recorded on a circular chart calibrated in degrees of temperature, by means of the usual pen mechanism in connection with the Bourdon spiral.

The thermometer installations at the Charing Cross Hospital were carried out by the Cambridge Scientific Instrument Co., Ltd., Cambridge, under instructions from Mr. A. H. Barker, Wh.Sc., consulting engineer.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

The E.T.U. or the A.E.S.E.?

It is interesting to read the mass of correspondence served up by the respective Secretaries of the E.T.U. in the frantic endeavour to bolster up their claim to represent the electrical station engineer.

Unfortunately for the E.T.U., the letter from the St. Pancras B.C. is obviously an answer to an inquiry, and offers no proof that the E.T.U. had anything to do in the matter of war bonus and wages.

Regarding the letter from the North Metropolitan Electric Power Supply Co., the managing director distinctly states that "the arrangement only applies to weekly or hourly-paid men," which, of course, rules out the engineers-in-charge at the power stations.

It is evident to the least initiated that the electricity supply chief engineers, being clever and far-seeing men, will be quite approachable and considerate in the matter of war bonus, in order that the efficiency of their undertakings shall not suffer owing to having assistants who are harassed by pecuniary troubles. It is, therefore, up to the A.E.S.E. to see that the E.T.U.'s aggressive methods do not get the credit for all justice meted out to the electrical station engineers.

I certainly hope "W. F. K." is a member of the E.T.U.

C. B. T., A.M.I.E.E.

The letter of "W. F. K." in your last week's issue is amusingly satirical, but volubly incoherent. No useful purpose is served by shelving the problem or obscuring issues by an indiscriminate application of a gift for cynical asperity—except, perhaps, to provide a little harmless amusement.

A remembrance still lingers of a casual acquaintance with the Euclid of our studious youth—how each proposition was clearly

set out and the proof arrived at by the test of logic. It should not be a serious matter to apply that test to our present proposition.

Upon what are Associations based?

The hand of precedent here guides us. The world is an Association of nationalities; nations are Associations of races; races, Associations of individuals. Each way we look, there we find Associations, companies, societies, unions, federations, and the like. They are in, and of, science, industry, commerce, literature, religion, the drama, art, philosophy, and entertainment. But why? Because there exists a common denominator. That is fundamental to every nation, race, or association—it is the essence of collectivism.

Testing our conclusion, we find innumerable examples in the history of associations where, with the loss of that common denominator, collectivism sub-divides or dissolves into individualism.

Leaving generalities and applying ourselves to the specific case in hand—an Association of Station Engineers—we may set it down as sound theory, if an incorrect statement of practice, that all station engineers have identical training and qualifications. Assuming this, we conclude a common denominator—viz., identical training and qualifications.

Did we carry investigation no further, then surely here are all the elements of Association.

Our investigation, however, is incomplete; there is another possible common denominator—viz., degree of administration. All presumably are administrative: the difference is one of degree, and herein lies our problem.

If the common denominator is theoretical equality of engineering training it must be an invariable, and an association so founded would be stable.

If the common denominator is degree of administration, then it is a variable, and an association so founded would be unstable. But it is neither the one nor the other; it is one qualified by the other.

We are forced, then, to the conclusion that an association would only be stable between the limits of the purely administrative and the wholly operative.

Exactly who is between these limits is a matter for individual decision; classifications and designations are misleading.

The need for an association exists beyond doubt, but the crisis that makes clear such need is not necessarily a common denominator upon which to found an association.

Confusion of thought only leads to recrimination: so soon as it is clear that economic pressure is the cause, and not the common denominator, every section will sort itself out on the basis of the common denominator.

London, S.W.

H. W. Healy.

It would be interesting to know how it comes about that correspondence between this Association and a Government Department finds its way into the hands of the Electrical Trades Union. In case, however, the reply made by this Association to the letter from the Chief Industrial Commissioner's Department, sent to you by Mr. W. J. Webb, has not already been brought to his notice, I enclose a copy for publication.

W. Arthur Jones,

Hon. Sec., Association of Electrical Station Engineers of London,

Leytonstone, November 5th, 1917.

[COPY.]

October 19th, 1917.

"Sir George Askwith.

"Chief Industrial Commissioner's Department.

"Ministry of Labour, Whitehall.

"Dear Sir,—Yours of yesterday to hand. I note your suggestion with regard to communicating with Mr. W. J. Webb, of the Electrical Trades Union.

"This suggestion is evidently based upon a misconception of the true situation, and the following facts should make this clear. This is not a quarrel between two sets of Trade Union officials as to which Union can claim the greater membership. This Association has no paid officials—its acting officers are engineers engaged in power stations, and have, therefore, a fully developed sense of their responsibilities.

"The London power stations are, at this moment, vital key industries directly controlling the output of war material. The suggestion that the highly trained engineers in control of this important section of national industry should become absorbed by the Electrical Trades Union (which is essentially a wireman's Union, and has only recently taken advantage of dissatisfaction amongst sub-station men—mostly L.C.C. men—to embrace them, and thus claim to represent engineers-in-charge), is unquestionably opposed to national interests.

"No section of men have been more loyal or patriotic than power station engineers, and I suggest that it is vital to preserve their entity.

"As your letter is in no way a reply to my communication of the 17th inst., I shall be glad to receive either a negative or affirmative concerning representation at the impending conference between the A.M.E.E. and E.T.U.

"The fact that this Association has in its membership practically every engineer-in-charge at the 30 London Council stations cited by the E.T.U. should in itself be sufficient evidence of the grotesque nature of the claim made by the E.T.U. to represent power station engineers."

"In view of the urgent nature of the matter, I shall be glad to have an early reply in order to place the matter before the Executive Committee."

"Yours faithfully,

"(Signed) W. ARTHUR JONES, A.M.I.E.E."

The following is taken from the "Branch Notes" of the *Electrical Trades Journal* dated September, 1917:—

"Our slogan should continue to be that membership of our Union carries with it exemption from military service. Nothing else will satisfy us; anything less—well, there is trouble for someone."

Earlier in the same note attention is drawn to the increasing membership of the Union, and before the Chief Industrial Commissioner, on September 5th, emphasis is again given to this feature. A not unnatural inference from this would be that there is some connection between the increasing membership of this Union and the claim of exemption from military service for its members, but such an inference would be altogether wrong, because of the members already serving with H.M. Forces and because of those willing to serve when required to do so.

So far as is known, the E.T.U. is the only one claiming for its members exemption from military service. It cannot be that the majority of the members of this Union are willingly supporting their officials in such a claim, but that through ignorance of one of the objects, they are supporting through their Union a principle which is altogether foreign to their own real feelings.

J. R. W. Gralnge.

London, W., November 1st, 1917.

[The passage quoted may represent the policy only of a particular branch of the Union; we hope that it is not endorsed by the Union officially. Perhaps Mr. Webb will clear up this point, the importance of which cannot be denied.—EDS. ELEC. REV.]

With your kind permission, I should like to state my experience whilst a member of the A.E.S.E. I joined the A.E.S.E. soon after the Manchester Branch opened. At that time anyone was eligible to become a member provided he worked in an electrical station. The cleaners, better known as "assistants," were admitted to membership. There was no distinction. Personally, I thought that a good kick-off for social reform. The majority of the members, I feel sure, very sensibly advocated Trade Union principles, referred to by "Status" as "agitators." The other section, better known as "Status Engineers," did not desire to associate themselves with such an unhealthy system for fear of losing the respect of their chief, who is slowly grinding them down.

These are Trade Union methods: "Peaceful persuasion first"; if this is not effective, and it rarely is, then strike. Chief engineers and employers of labour do not like to be forced against their will, hence you lose their respect and good feeling; on the other hand, you gain the coppers. "Status" evidently prefers the respect!

"Status" also says, "If the A.E.S.E. joined the E.T.U. there would be a division in their ranks." It is evident that they have not yet lost their agitators.

The E.T.U. are anxious to welcome these so-called agitators. They want to better their conditions, and they can do it. Let "Status" remember that the A.E.S.E. was allowing us to struggle on with a starvation wage. We are told to be patriotic because we are at war, but patriotism evidently is not in the category of the profiteer. Let the capitalist satisfy his greed while we continue to be patriotic. This appears to be the motto of the A.E.S.E.

Alpha.

In the current issue of the *ELECTRICAL REVIEW*, under the above heading, Mr. H. H. Morton makes certain statements which cannot be allowed to pass unchallenged.

He states that among the employees of the North Metropolitan Electric Power Supply Co. the E.T.U. have a membership of over 50, which may be correct, but read in conjunction with the previous paragraph it might be inferred that the 50 members include the supervising grades of power-station charge engineers. I challenge Mr. Morton to give the name of one member of the staff—that is to say, a technically-trained engineer in responsible charge of a watch in any of the company's power houses—who is enrolled in the E.T.U. The membership of 50 does embrace sub-station attendants and various lower grades down to and including trimmers and yardmen.

I hold no brief for the A.E.S.E., but, in common with my colleagues, I strongly object to the action of the E.T.U., which purports to speak for a class of men who are not, and do not wish to be, in any way associated with them.

With regard to the imputation of misrepresentation which Mr. Morton accuses the A.E.S.E. of making, I make no comment, as this matter will probably be dealt with by correspondents more conversant with the facts than I am. I do, however, charge Mr. Morton with direct misrepresentation when he states that the E.T.U. obtained the Engineering Award for "our North Metropolitan members."

As one of the principal assistants in the company, I am in a position to know that the question of making further increases in the rates or bonuses already paid was being considered before any

sort of action was taken by the E.T.U. It is not too much to say that the action of the Electrical Trades Union had, if anything, the effect of delaying the increase rather than of assisting the employees.

F. D. Napier,

Resident Engineer.

Willesden Power House,

November 6th, 1917.

The Teaching of "Electrical Installation Work."

A practical man, who has evidently been a student also, comments (in the current issue of one of your contemporaries)* on his experience of the unsatisfactory nature of the treatment of the above subject.

He mentions a class of 12 students where the workshop equipment consisted of "one saw, two screwdrivers, one pair of pliers, wood casing, and a few pieces of scrap wire." If it be assumed that he has omitted some items—such as jointing materials—he makes it clear that there was "no conduit, and no distribution boards, cut-outs, bells, or fire alarms."

There is much more in the letter, pointing to utterly inadequate and unsuitable methods of instruction; and we mention it here as it bears out what we have said many times in your columns.

A. P. Lundberg & Sons.

London, N., October 29th, 1917.

A Graphic Method of Calculating the Resistance of two Circuits in Parallel.

In your issue of January 24th, 1913, and since in a later issue was described a method for calculating the resistance of two or more circuits in parallel. Having had a number of calculations to make, I thought the simple way in which a "shunt calculator" may be made might be of interest to your readers. All that is necessary is a

piece of cross-sectioned paper on which the abscissa and ordinates are marked off in equal dimensions from 0 to 100 to any convenient scale, say, 2 cm. = 10 ohms, starting from the top left-hand corner. The diagonal is now drawn as shown. It will be seen that the diagonal division = $\sqrt{2}$, or 1.414 times a division on the sides.

Hence, if we put a straight edge on 30 ω and 60 ω , it crosses the diagonal at 20 ω , which is the joint resistance.

L. O. Meyer.

Belford, October 29th, 1917.

Dublin Electricians' Wages.—Some time ago the Dublin Electrical Trades Union and the Master Contractors' Association failed to come to an agreement as to an award of 15s. increased wages, passed by the Committee of Production, and the Union men ceased work. Ultimately the masters made an offer, which was accepted unconditionally and without prejudice to any demand in the future. The old rate of payment was 9d., with 2s. 1d. war bonus, equal to 10d. per hour (50 hours); the new rate is 1s. per hour (50 hours), and a special rate of 3s. per week for those engaged on war work.

A PORTABLE ELECTRIC-LAMP COOKING BOX.

MR. LEOLINE EDWARDS, of 81, St. Margaret's Road, Twickenham, has brought to our notice an ingenious device calculated to bring electric cooking within the reach of everyone who has an electricity supply. It consists essentially of an improved "hay-box" provided with a heating element to maintain the temperature necessary for cooking, thus getting over the inherent defect of the plain hay-box. The heating element is nothing more elaborate than an ordinary 32-c.p. carbon lamp, attached to a length of flexible, which can be connected to any lampholder with the aid of an adapter. The construction of the box is shown in the accompanying figures. It consists of two iron cases, thermally insulated from one another by "Quidos" expanded cork—a material originally produced by the inventor for other purposes, but admirably adapted for heat insulation, as the granulated cork is put through a treatment which expands the air cells to twice their normal size, resulting in a light, resilient, and sanitary material, which cannot become sordid with water and is very durable. Its thermal conductivity is stated to be 0.041. A hole is provided near the base of the box, through which the lampholder is passed, the lamp being inserted from the inside; the loss of heat through the hole is trifling, and the faint light which escapes affords an indication that the lamp is alight. The inner case is specially designed for convenience in use, and handy stands are provided which enable several dishes to be cooked simultaneously; the ordinary hay-box must on no account be opened after the hot dish has been placed inside it, but the electric hay-box can be opened for inspection or removal of the dishes without affecting its functions, as the temperature is soon restored by the lamp to the proper value. The maximum power consumed is 120 watts, and the cooker can be left unattended for hours without risk; it can also be used in any room where current is available, being perfectly portable.

Mr. Edwards has tested the cooker repeatedly in steaming and stewing foods, roasting and stewing simultaneously, and in baking

scheme for providing Russian agricultural prisoners with simple machines to take back with them to their villages, with the promise of a commission on any they can sell. This should help to make us fully alive to the sort of competition we must be ready to face." *Financial Times*.

Book Notices.—*Terms of Industrial Peace.* By Alex. Ramsay. London: Constable & Co., Ltd. 3s. net. The author of this very readable contribution to what is really one of the most pressing subjects of the times, considers the relation, in the industrial equation, of the two factors, Capital and Labour, and endeavours to suggest a means by which the two may be brought into co-operation for their mutual interest and the good of the community. The main question at issue is that of wages; but wage is a relative term, and its value depends upon the commodities that can be purchased with what is earned. Employers must adopt improved production methods in order to carry the inevitable additional labour charges; they will need to show discernment and sympathy, and workmen must agree to abandon their attitude of hostility and suspicion and promote a willingness to co-operate in the extension of a system which will make it possible for Labour to prosper and Capital to get a fair return. Following a general statement along these lines, Mr. Ramsay devotes following chapters to the following matters, which have an important bearing on the whole subject:—The growing power and the immediate demands of Labour; how employers can increase production; the American example (manufacturing methods and the relations of employers and employed in relation thereto); education and environment; the mind of Labour; the machinery of arbitration; the control of food prices; the limitation of profits; and moral responsibility. The author covers a very wide ground, and touches upon many of the social conditions which in reality lie at the very root of the whole tree of discontent with life, and which, unless they are removed or ameliorated, will always prevent the full fruit of permanent industrial peace being achieved. We are all eager for millennial conditions to prevail in industry. It is right to

SECTIONS OF THE PORTABLE ELECTRIC-LAMP COOKING BOX.

pies, cakes and pastry. Hot water put into the cooker can be kept hot for use at any time, a convenience at night in case of illness: if the water is put in cold (50° F.), the lamp will heat 12 pints to 200° F. in seven hours, with an expenditure of less than one unit.

The cooker was designed to deal with small quantities of food, and thus does not compete with the more ambitious types of electric cooking apparatus. Actual experience shows that a dinner for three persons, consisting of 3 lb. of beef, roasted with potatoes, steamed turnips, beans, rice, and prunes, was done in 3½ hours; the cost, including electrical energy for the lamp, the renewal of the lamp, and gas for previously bringing to the boil four saucepans containing the vegetables, rice, and prunes, was three farthings. The apparatus, which will soon be on the market, can be seen and tested at any time by appointment. It measures 18 in. in diameter and 20 in. in height, and weighs 30 lb. Provisional protection has been applied for.

BUSINESS NOTES.

German Designs on Russian Trade.—An illustration of the vigour with which Germany is preparing to carry on the economic war after the military campaign is over is furnished by what she is preparing to do in regard to Russia. It is stated from reliable sources that the enemy has already established classes in which discharged soldiers are being trained as commercial travellers for that country. They are taught the Russian language, Russian history and Russian methods of business, and are otherwise prepared for the work which is supposed to lie before them. Moreover, a considerable number of women—some 40,000, it is believed—are also being taught Russian, so that they may be able to conduct correspondence and replace the sadly depleted ranks of male clerks. Yet another idea that is being developed is a

have a high ideal in the matter, but we live in a very human world surrounded with all sorts of limitations hindering the success of our high endeavour. The future of the Labour and industrial world in all countries may be very different from the past, but we must not suppose that a new Heaven and a new Earth are going to be brought Phoenix-like from the ashes of a horrible war. Nevertheless, a proper study of the subject of industrial peace is everybody's duty, and Mr. Ramsay, who claims to know both sides of the case from experience, succeeds in stimulating helpful thinking.

"Proceedings of the American Institute of Electrical Engineers." Vol. XXXVI. No. 10. New York: The Institute. Price 81.

"Alternating-Current Electricity and its Applications to Industry." By W. H. Timbie and H. H. Bigbie. London: Chapman & Hall, Ltd. Price 13s. 6d. net.

"Elements of Electrical Engineering." Vol. I. D. and A.C. Machines and Systems. By W. S. Franklin. London: Macmillan and Co., Ltd. Price 84.50.

"Scientific Papers of the Bureau of Standards." No. 306. An experimental study of the Fahy permeameter. Washington: Government Printing Office. Price 10 cents.

Storage Battery Manufacture.—La Société des Accumulateurs Electriques (Anciens Etablissements Alfred Dinin) is the name of a new company which has lately been formed at Nanterre, with a capital of £60,000, to acquire and carry on the Dinin accumulator business.

Dissolutions and Liquidations.—MEA MAGNETO CO., LTD.—Mr. C. R. Beeby, the controller, has applied for his release.

STEEL'S ELECTRIC AND ENGINEERING CO., LTD., 206, East India Dock Road, Poplar.—In this matter (a winding-up order was made last July) accounts have been lodged showing total liabilities £1,054 (unsecured £664), assets £11, and a deficiency of £655 as regards contributories. Mr. W. J. Warley, Official Receiver and Liquidator, reports that the company is a private company promoted by T. G. Steel, S. F. Hastings and E. Lee. It was registered on August 23rd, 1916, with a nominal capital of £3,000, and was

formed to take over as a going concern the business of Steel Bros., and to carry on the business of electricians, mechanical engineers, &c. The failure of the company is attributed by Geo. Steel and S. F. Hastings to want of capital and pressure of creditors.

Moonshine.—MESSRS. C. A. VANDERVELL & CO., LTD., of Acton, have issued in the form of a picture postcard a useful November moon-chart which has been compiled by Mr. A. H. Midgley, their chief engineer.

Catalogues and Lists.—BRITISH THOMSON-HOUSTON CO., LTD., 77, Upper Thames Street, London, E.C.—There has been issued by the Lamp and Wiring Supplies Department a waistcoat-pocket card calendar for a year from last July. Supplies, over-printed with name and address of contractors and dealers, can be obtained on application to the Publication Department.

MESSRS. BROOM & WADE, LTD., High Wycombe, Bucks.—Folder giving general particulars respecting Hyatt flexible roller bearings.

MR. JOHN PHILLIPS, 166, Walworth Road, London, S.E. 17.—Illustrated leaflets showing new designs of his motor-driven commutator grinders.

The British Industries Fair, 1918.—Next year's British Industries Fair, for which application forms for exhibiting space, are now being issued by the Board of Trade, will be considerably larger than those of previous years. The last two Fairs were held in the Victoria and Albert Museum and the Imperial Institute, and the space available was not sufficient to meet the demands of the exhibitors. In many cases, in fact, exhibitors' applications for space had to be cut down by as much as 60 per cent., and the fact of the Fair being in two buildings caused some inconvenience. The 1918 Fair, which will open on Monday, February 25th, and remain open for a fortnight, is to be held in premises which the Port of London Authority have placed at the disposal of the Board of Trade, and it is hoped that the available space will be sufficient to meet exhibitors' requirements, at any rate for the coming year, as the Fair will, owing to the war, again be restricted to the following trades:—Earthenware and china trade; glass trade; fancy goods trade; paper, stationery, and printing trades; toy and games trade.

The 1918 building contains about twice as much space as was available this year. It is more conveniently situated for business men, being near the Tower Bridge, and is a large roof-lighted warehouse on one floor. Firms who are anxious to exhibit should send their applications for space to the Director, British Industries Fair, 10, Basinghall Street, London, E.C. 2, at the earliest possible moment.

Bankruptcy Proceedings.—SAMUEL STEPHEN COSTER, electrical engineer, &c., 14, Gladstone Road, West Ham Park, trading as S. S. Coster & Co.—Under this failure, accounts have been lodged at the London Bankruptcy Court showing liabilities £670, and assets "bad book debts of £490." According to the observations of the Official Receiver, the debtor, in August, 1908, with £150 capital, became a partner in the business of electrical and mechanical engineer carried on at 114, Bishopsgate Street, E.C. That business was not a success, and was abandoned in June, 1909, whereupon the debtor started on his own account, and in his own name, at 78, Amity Road, West Ham Park, removing to Gladstone Road in 1912. Two years ago he adopted the style of S. S. Coster & Co., with a view to his son joining him in the business on his release from the Army. In November, 1916, his stock-in-trade and effects were seized and sold at the instance of a creditor, and very little business has since been transacted. The debtor attributes his insolvency to decline in his business through bad trade, lighting restrictions, and shortage of labour, to bad debts, and to his ill-health, which at times prevented him giving his full attention to the business. A sitting was held last week, before Mr. Registrar Hope, for the debtor's public examination. The Official Receiver reported that the debtor had not filed cash and goods accounts, nor had he attended on the Official Receiver, as required to do. It was a case calling for considerable investigation; there were no books or banking account, and it was impossible to say what the debtor had done with goods advanced on credit and not paid for. His Honour adjourned the examination, and directed the debtor to furnish the accounts, and to attend on the Official Receiver forthwith.

Enemy Samples.—In the new Sample Rooms of the Department of Commercial Intelligence, 73, Basinghall Street, E.C., there is on view for the information of British manufacturers an exhibition of samples of German and Austrian goods, including many recent additions, showing new styles of goods that are being introduced in enemy countries.

Auction Sale.—MESSRS. P. HUDDLESTON & Co. will sell by auction at Hammersmith on Tuesday, November 20th, a quantity of electrical apparatus. Full particulars are given in our advertising pages to-day.

LIGHTING AND POWER NOTES.

Accrington.—The requisite notice is to be given, under the terms of the agreement for the supply of electricity to Haslingden, of intention to terminate such agreement on December 31st, 1918, for review and adjustment.

Australia.—With regard to the question of acquisition of a coal-bearing property by the Sydney Municipal Council, it is

suggested that the Government Geologist, the Chief Inspector of Mines, and Mr. D. A. W. Robertson should consider the offers. A deputation is to wait on the Minister for Labour and Industry in regard to the alleged monopoly in connection with coal supply for electricity supply purposes.

According to the *Times*, restrictions imposed in Australia on October 11th on the use of fuel and power for industrial purposes were to be removed last Monday.

Bootle.—PROPOSED PLANT EXTENSION.—The question of electricity works extensions again came before the T.C. last week; the borough engineer reported that he had received an application from a cold storage firm for a supply of electricity to premises which it is proposed to erect in the district, but that the present generating plant will not permit of this being done. Eight other applications for large supplies had already been refused, and the demand for current was steadily increasing. The Electricity Committee strongly expressed the opinion that it was imperative that additional plant should be provided, and it recommended that the Council should apply to the L.G.B. for sanction for immediate expenditure on works extension and provision of plant, at an estimated cost of £73,500. After a long discussion the matter was referred to a Special Committee for consideration.

Bradford.—WAGES.—The Bradford Corporation Employés' Joint Sub-Committee, which represents nearly 4,000 employés of the municipality, has put in an application for an advance in wages for the members of certain Trade Unions, including the Electrical Trade Union and the Amalgamated Society of Engineers. The demands are for an advance of 100 per cent. on pre-war rates, equal rates for men and women on similar classes of work, and time and a-half for overtime on ordinary working days and double time for Sundays and Bank Holidays. The Special War Wages Committee of the Corporation has already had an application from the tramway workers for an advance of £1 per week on the pre-war rates, and a request for equal treatment of women with men in matters of war bonns.

Bristol.—STREET LIGHTING.—The Sanitary Committee, with the permission of the Chief Constable, has decided to re-light all the arc and half-watt lamps and the electric incandescent lamps; the top halves of the lamps will be painted a dark colour, and the bottom halves with one coat of white paint. In the event of an air raid over Bristol the supply will be cut off at the power station for these lamps, together with all other electric lighting in the city. The number of arc and half-watt lamps at present unlighted is 258, and of incandescent lamps 937.—*Bristol Times and Mirror*.

Burnley.—The electrical engineer reports that he has informed the Tadmorden authorities that the supply of electricity in bulk to the latter town was not feasible at the present time.

The Electricity Committee has sent a resolution of protest to the Coal Controller on the unfairness of making the recent advance in the price of coal retrospective.

Burton-on-Trent.—PRICE INCREASE.—The price of current is to be increased by 10 per cent. from the quarter ending December 31st.

Canada.—According to the financial Press, the Ontario Hydro-Electric Commission, which recently bought out the Ontario Power Co., is also seeking to purchase the Electrical Development Co. and the Canadian Niagara Co., the other generating companies on the Canadian side of Niagara River. Such a purchase would also involve the acquisition and operation of the Toronto Railway Co. and the Toronto Electric Light Co. in the one case and similar utilities in the city of Buffalo. It is suggested that even the purchase of these undertakings would not enable a sufficient margin of power to be obtained to meet the requirements of the Ontario Commission's customers.

Carlisle.—A supply is to be given to the works of Messrs. T. Brown & Co., and, subject to sanction, a loan is to be applied for to cover the cost of cables.

Continental.—SWEDEN.—According to a recent statement in the Swedish Press, the Stockholm Waterfall Board has asked the Government for a grant of 4,000,000 kroner, of which amount 3,000,000 kroner are to be used for the power station on the Lulea River, and 1,000,000 kroner for regulating the water supply in certain lakes.—*Board of Trade Journal*.

Edinburgh.—The annual inspection of the Corporation electric generating stations took place last week, the North British Rubber Co.'s works being also visited. At the subsequent dinner, the convener stated that if there were no lighting restrictions they would be running dangerously near the limit of their plant capacity; they were anxious as to the new Portobello station, without which they could not supply a tramway load. It has been decided to recommend an increase of 3d. per unit in the lighting rate, making 33d. per unit.

Greasborough.—PROV. ORDER.—The U.D.C. has given notice of its intention to apply for a prov. order to supply electricity in the area for lighting and power purposes.

Halifax.—PROV. ORDERS.—A special meeting of the T.C. is to be called to authorise an application for prov. orders to enable supply to be given in the urban districts of Mytholmroyd and Luddenden Foot.

Hebden Bridge.—At a Council meeting, last week, it was stated that arrangements were nearly complete for the supply of electricity from Halifax to supplement the local production.

Holmfirth.—The U.D.C. has considered a report by its electrical engineer, and a Sub-Committee has been appointed to consider an extension to Somersfield.

Kingston-on-Thames.—At a recent meeting of the T.C., a recommendation of the Lighting Committee to increase the salary of the chief assistant electrical engineer, met with considerable opposition, one reason being the financial position of the undertaking.

The electricity accounts for the past year show a net loss of £6,790, which is equivalent to an 8d. rate.

Leeds.—Industrial workers—especially women—are demanding, through the Trades and Labour Council, better street lighting, and a deputation has been appointed to wait upon the Chief Constable.

Leicester.—NEW POWER STATION.—The T.C. has unanimously adopted a report by the Electricity Committee, recommending that an application be made to the B. of T. for a provisional order authorising the purchase of 36 acres of land on the Aylestone Road for the construction of a new generating station, together with buildings, plant, &c., as may be necessary. Ald. Flint, in moving the adoption of this report, said their generating plant was working at its full capacity, and it was necessary to take the earliest opportunity of meeting the growing demand for electricity. It was probably well known that outside interests were waiting to come into Leicester, and if the Council did not take advantage of the opportunity which presented itself, it might be lost in the future. He did not anticipate any opposition from the Gas Committee, seeing that the Electricity Committee would probably become its best customer.

Mr. C. H. Wordingham, who has reported on the matter to the Council, addressed the latter, pointing out the desirability of commencing the work as soon as possible, and the advantage of co-operation between the electricity and gas undertakings in the interests of fuel economy. He pointed out the necessity of unifying the present diverse systems of supply, and the advantages of a single power station for all purposes.

Lewes.—STREET LIGHTING.—The T.C. has sealed an agreement with the Electric Supply Co. for the supply of current for street lighting.

London.—MARYLEBONE.—The general manager's report on the working of the electricity department for the June quarter shows that 3,598,200 units were sold, representing a net increase of 13.25 per cent. over June, 1916. The net revenue from the sale of electricity and meter rentals amounted to £33,730, being an increase over that of last June of £1,782. The total expenditure for the quarter amounted to £19,093, an increase as compared with the June quarter, 1916, of £1,812. The total average costs per unit sold were 1.274d., as against 1.305d. for the previous June quarter. The net results of the quarter's trading is that the surplus realised towards the payment of the capital charges amounted to £17,522, compared with £17,945 at June 30th, 1916, a decrease of £423; but as these charges for the current year are estimated at £1,400 less than last year, the position is well in hand and the estimates have been more than realised.

HAMPSTEAD.—Electric indicators to give air warnings, showing "take cover" and "all clear," have been attached to certain lamp standards, these being operated from a central control point.

Manchester.—Preliminary notice of a further increase in electricity charges has been given. It is expected that the new prices will become operative from next December quarter-day.

Marsden.—PROV. ORDER.—The U.D.C. has decided that consent be given to the granting by the B. of T. of a prov. order authorising the Electrical Distribution of Yorkshire, Ltd., to supply electricity within the urban district, subject to a clause being inserted having regard to prices to be charged to consumers, the laying of cables underground, and a time limit for having the supply available.

Rochdale.—PRICE INCREASE.—The T.C., last week, decided to advance the charges for electricity from November 14th as follows:—Lighting 33½ per cent., instead of the existing 25 per cent.; power over 15-kw. demand, advance of 0.4d. per unit, under 15-kw. demand advance of ¼d. per unit, instead of 3d. per unit; tramways, advance of 25d. per unit in place of the existing 15d. per unit. Councillor Walker stated that the additional cost of coal of 2s. 6d. per ton and the increased wages of employés, made an extra amount required of £3,512, and the advanced charges are expected to realise £2,964, leaving a deficiency of £600.

Rotherham.—LINKING-UP.—At the Electric Lighting Committee, it was reported that a conference had been held with representatives of the Sheffield Corporation to discuss the question of linking-up the power stations at Sheffield and Rotherham as desired by the Ministry of Munitions. The conference decided to recommend to each authority the desirability of linking-up the two power stations, and instructed the respective engineers to meet and endeavour to agree to a tentative scheme to carry this into effect, such scheme when arranged to be submitted to the respective Electricity Committees for consideration.

Spenborough.—BULK SUPPLY.—The Electricity Committee has decided to recommend that an agreement be entered into with the Yorkshire Electric Power Co. for a supplementary supply of current from its system, subject to the sanction of the B. of T. to the necessary expenditure on a transforming plant.

Stafford.—The Electricity Committee reports an increase last year of 21½ per cent. in the output of electricity.

Todmorden.—PRICE INCREASE.—The Electricity Committee has decided to increase all charges 10 per cent., with a flat rate of 5d. per unit for lighting.

Wakefield.—PRICE INCREASE.—As from December 1st next, the price of electricity for power purposes will be advanced 25 per cent. over the current prices, and for lighting purposes 12½ per cent. over the current prices.

York.—PRICE INCREASE.—The Electricity Committee has decided to increase the charges for power to consumers by 10 per cent. from January 1st next year.

TRAMWAY AND RAILWAY NOTES.

Belfast.—TRAFFIC FIGURES.—The total revenue of the tramways for the six months ending September 30th was £166,571, as against £151,981 for the corresponding period last year, an increase of £14,590. The expenditure reached the alarming total of £107,070, as against £89,723, an increase of £17,347. As a result, the gross profit was reduced to the extent of £2,757, or to £59,501, as against £62,258. Net revenue and appropriation charges totalling £59,186 reduced the gross profit to the figure of £316, or £3,567 less than the surplus, £3,883, for the first six months of last year. The increased expenditure on revenue account was:—Traffic, £9,142; repairs and maintenance, £3,573; power, £1,512; and general expenses, £90. The first item was chiefly attributable to increased wages, the second to the same and cost of materials, and the third to the high price of electricity.

Birmingham.—The Corporation has decided to promote a Bill in Parliament for, among other things, the construction of a short length of tramway from Longbridge to Rubery, on the outskirts of the city, where there has been great industrial development.

Dudley.—ACCIDENT.—A serious accident, which happily did not result in any loss of life, occurred last week. A fully loaded car was proceeding down the Bath Hill when the driver, who was a learner, lost control, the vehicle running away and colliding at the bottom with another car. Both cars were very badly damaged.

Hebden Bridge.—At last week's Council meeting, the clerk reported the willingness of Halifax and Todmorden Corporations and the Hebden Bridge Rural Council to confer with the District Council on the subject of the possibility of joining up the existing tramway system from Halifax to the motor-bus system at Todmorden, over a mile and a-half of road, which has at present no service, and he was instructed to call a conference at Hebden Bridge.

London.—The London United Tramways Co. has intimated to the districts through which its lines pass that it is going to apply to Parliament for an Act asking to be relieved from the restrictions imposed on the company with regard to fares, so that it can raise them, and also for power to abandon some portions of its lines in Middlesex and Surrey.

Manchester.—FARE REVISION.—The City Council has instructed the Tramways Committee to immediately consider the revision of fares. At its last meeting the Tramways Committee decided to leave the matter over pending the report from the Trading Profits Committee as to the amount expected from the undertaking towards the rates. Councillor Fox strongly opposed the increase of fares until it was known what was expected from the department, and said that when the Committee was convinced the undertaking was not paying its way it would be prepared to raise fares, providing it was assured that the money would go into the department concerned, to make up its losses, and not go to saving the rates.

New Zealand.—The report of Mr. C. F. Alexander, manager of the Dunedin City Tramways Department, for the year ended March, 1917, contains the following information:—Total revenue, £79,928; working expenses, £43,514, leaving a gross profit of £36,414; loan and special charges, &c., amounted to £30,460, leaving a net surplus of £5,954, as compared with £4,840 the previous year. The car-mileage was 1,295,988, a slight reduction on last year's figures. The passengers numbered 15,135,567, an increase of 285,816.—*Commonwealth Engineer.*

Salford.—FARE REVISION.—Ald. Linsley, speaking at the Council meeting, said the recent award to tramway workers by the Committee on Production had added to the working expenses of the tramways £140 a week to working employés, and £85 to those serving with the Colours. The Committee was already paying in war bonus awards £434 and £184 respectively, and it was also paying £210 a week to soldiers' dependents, making a total weekly payment of £1,053, or £54,756 per annum. The increased fares were justified, but even if the receipts continued to be satisfactory, and no further burdens were placed on the department, it might not be possible to place any contribution to the reserve and renewals fund, and it might be necessary to ask for help from the rates for the repair of the permanent way.

Wallasey.—**YEAR'S WORKING.**—The Corporation tramways had a record year, according to the annual report just issued. The receipts were £78,756, an increase of £4,135; the passengers numbered 15,125,000, an increase of 819,000; and the car-mile earnings were 1358d. against 1292d. The additional war bonuses absorbed £1,050, and £2,719 was paid in war allowances. A sum of £8,500 was allocated to the rates, equal to 1d. in the £, and the highest amount yet handed over.

Wigan.—**ACCIDENT CLAIMS.**—Arising out of the accident on the Corporation tramways in July of last year, 17 cases came before the Registrar of the Wigan County Court, in which passengers claimed damages from the Corporation. A test case had already been brought, in which £45 damages was awarded. Ten of the claims were settled, the total payments accepted being £290, as against £410 claimed. In the contested cases the aggregate damages awarded were £490, compared with a total of £642 claimed. A claim of £500 damages was brought before the Under-Sheriff at Liverpool, last week, by another passenger, and it was stated that the Corporation admitted liability. A verdict for £325, and costs, was given.

The T.C. has decided to purchase a number of L.C.C. tramway cars, if suitable. Alderman Fletcher referred to the abnormal demands made by the traffic at week-ends, and said the Committee would pay almost any price for new cars, if such were to be had; 20 months ago they gave an order for some gear and pinion wheels, but they had not yet been supplied.

Wolverhampton.—The Tramways Committee states, in its annual report, that there is an approximate increase per annum of £7,700 for wages and war bonus, £2,000 for petrol, and £2,400 for electricity. The increased cost of running is having careful attention, and, if these high costs are maintained, it will be necessary to raise fares in due course.

TELEGRAPH AND TELEPHONE NOTES.

Telephone Time Service in Switzerland.—Immediately after the outbreak of the European war, the Government of Switzerland suspended the operation of private wireless stations throughout that country. One result of this step was to prevent the receipt of the daily wireless time signals from the Eiffel Tower, in Paris, to the considerable inconvenience of the Swiss watch and clock makers, as well as many other persons who had been in the habit of receiving these signals. In order to remedy this situation, the Federal telegraph and telephone service installed at Berne automatic apparatus, designed by E. Nussbaum, whereby the wireless time signal received by the official station at that place from Paris is conveyed over the telephone lines to telephone subscribers who desire it. This plan has been in operation since May, 1916, and astronomical observations made at the Federal observatory in Zurich show that the accidental errors involved in the transmission of the signal rarely exceed a tenth of a second.—*Telephone Engineer.*

United States.—The U.S. Government has prohibited the exportation of wireless apparatus from the country except under special permit.

CONTRACTS OPEN AND CLOSED.

OPEN.

Aberdeen.—November 19th. G.N. of Scotland Railway. Telegraph material for six or twelve months. Stores Superintendent, 80, Guild Street.

Australia.—PERTH.—December 5th. Deputy P.M.G. Telegraph and telephone instruments and parts, also battery material, according to schedule and conditions, a copy of which may be seen at the offices of the ELECTRICAL REVIEW, or at the Commonwealth Offices, Australia House, W.C.

December 12th. Deputy Postmaster-General. Switchboards, telephone parts, as per schedule, a copy of which, as well as the contract conditions, may be seen at the offices of the ELECTRICAL REVIEW, or at the Commonwealth Offices, Australia House, W.C.

Beckenham.—November 12th. U.D.C. Three months' supply of coal for the electricity works. See "Official Notices" November 2nd.

Bradford.—November 24th. General stores for tramway department for one year. Particulars from Tramway Offices, 7, Hall Ings.

Enniskillen.—December 1st. Sligo, Leitrim & Northern Counties Railway Co. Telegraph material for 12 months. Mr. J. Duff Secretary, Enniskillen.

South Africa.—November 12th. S. African Railways. 1466 train-lighting cells. Secretary, Tender Board, S.A. Railway Headquarters, Johannesburg. Specifications may be seen at the Department of Commercial Intelligence, 73, Basinghall Street, London, E.C.2.

Wakefield.—November 17th. Coal for electricity works at Calder Vale for one year. City Electrical Engineer, Old Town Hall.

CLOSED.

Halifax.—The Electricity Committee has accepted the offer of Messrs. Bayliss, Jones & Bayliss, Ltd., to purchase the 750-kw. direct-coupled Belliss engine and the E.C.C. dynamo at the electricity works, Halifax, subject to the firm being able to obtain the sanction of the Ministry of Munitions to such purchase, for £2,500.

London.—**Marlyebone.**—The Electricity Committee recommends that the offer of the B.I. and Helsby Cables, Ltd., to extend their contract for a further period of six months subject to an increase of 10 per cent. on the prices contained therein, be accepted.

STEPNEY.—The Electricity Committee has accepted the offer of Messrs. W. H. Bowater, Ltd., to store at Griffith's wharf 2,000 tons of nutty slack, at 25s. 6d. plus rent for storage, 1d. per ton per week, the Council to insure against fire.

Pipe & Co., covering at Limehouse Station:—

Hobdell Way & Co., Ltd., accepted, £80.

Reid McFarlane & Co., £98.

Thermofelt, Ltd., £127.

Sheffield.—**Town Council.** Accepted tenders in connection with the erection of the emergency power house at Blackburn Meadows:—

John Greenwood, Buildings.

Gilbert, Heathcote & Co., Structural steelwork.

Clarke, Chapman & Co., Ltd., Electric capstans.

Crompton & Co., Ltd., Boosting sets.

Wolverhampton.—Corporation Electricity Committee:—

Ferranti, Ltd., H.T. switch cell for Sunbeam sub-station, £130.

Electric Construction Co., Ltd., Seven motors and switchgear for driving fans and auxiliary plant, £938.

Melville Dundas and Whitson, Second half of boiler house structure and other buildings, also reinforced concrete hopper for additional telegraph plant, £3,500.

Felt & Farrant Manufacturing Co., Ltd., Comptometer type calculating machine, £73.

FORTHCOMING EVENTS.

Junior Institution of Engineers.—Friday, November 9th. At 8 o'clock, at 30, Victoria Street, S.W., paper on "Precision Gauges," by Mr. H. J. Rickwood.

Physical Society of London.—Friday, November 9th. At 5 p.m. At the Imperial College of Science, South Kensington, S.W. Ordinary meeting.

Institution of Electrical Engineers, (Birmingham Local Section).—Wednesday, November 14th. At 7 p.m. At the University, Edmund Street. Chairman's inaugural address.

(**Western Local Section.**)—Monday, November 12th. At 7 p.m. At the South Wales Institute of Engineers, Park Place, Cardiff. Chairman's inaugural address.

(**Manchester Local Section.**)—Tuesday, November 13th. At 7 p.m., at the Engineers' Club. Chairman's inaugural address.

(**Scottish Local Section.**)—Tuesday, November 13th. At 7.30 p.m. At 207, Bath Street, Glasgow. Chairman's inaugural address.

Greenock Electrical Society.—Thursday, November 15th. At 7.45 p.m. At 22, West Stewart Street. Paper on "Telephone Switchboard Multiple," by Mr. A. Pick.

Institution of Mechanical Engineers.—Friday, November 16th. At 6 p.m. At the Institution of Civil Engineers, Great George Street, S.W. Paper on "Some Notes on Air Lift Pumping," by Mr. A. W. Purchas.

Electro-Harmonic Society.—Friday, November 16th. At 6.15 p.m. At the Holborn Restaurant (Venetian Chamber). Concert (ladies' night).

NOTES.

Volunteer Notes.—**COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).**—Headquarters, Balderton Street, Oxford Street, W. 1.

Orders for the week, by Lieut.-Colonel C. B. Clay, V.D., commanding:—

Officer for the Week.—Second Lieut. E. A. Ullmann.

Drills.—Week ending Saturday, November 17th, 1917:—

Monday.—No. 3 Company, Left Half. Recruits, signalling, 6.30.

Tuesday.—Physical drill and bayonet exercise, 7.30.

Wednesday.—No. 1 Company, 6.30.

Thursday.—No. 2 Company, 6; signalling, ambulance, 6.30.

Friday.—No. 3 Company, Right Half. Recruits, 6.30.

Saturday.—Inspection of N.C.O.'s and men in Sections A, B, and C by a Staff Officer from G.O.C. All N.C.O.'s and men in these sections are required to parade at Headquarters at 2.30 p.m. Uniform.

Note.—The Medical Officer will attend for examination of recruits, &c., on Thursday, at 6.

All channelled cap badges must be returned to the Quarter-Master Sergeant without delay.

Unless otherwise indicated, all drills will take place at Headquarters.

(By order) MACLEOD YEARSLEY, Capt. and Adjutant.

Appointments Vacant.—Charge engineer for the Farnworth (Bolton) U.D.C. Electricity Works; instructor in electrical engineering in connection with the training of discharged disabled sailors and soldiers for the County of Barnsley Education Committee Technical School; engineer for testing and calibrating switchboard instruments for the L.C.C. Tramways Department; shift engineer (70s.) station attendant (47s.), for the Stalybridge, Hyde, Mossley and Dukinfield Tramways and Electricity Board; two charge engineers for the City of Worcester Electricity Works; assistant mains superintendent (50s.) for the Borough of Rochdale Electricity Department. See our advertising pages to-day.

Educational.—**STOKE-ON-TRENT.**—The Corporation has appointed for the Central School of Science and Technology a principal of electrical and mechanical engineering, at a salary of £750 per annum. The directors of the Shelton Iron, Steel and Coal Co. have offered to contribute £100 towards a fund for research work.

Institution and Lecture Notes.—Greenock Electrical Society.

The programme of the Society for the coming session is as follows:—

October 18th.—Social and whist drive.
 November 1st.—Discussion on "Modern Generation and Distribution Systems," by Messrs. Angus and Macdonald.
 November 3rd.—Visit to Coplawhill Tramway Works.
 November 15th.—"Telephone Switchboard Multiple," by A. Pick.
 November 20th.—Open night for discussion.
 December 6th.—"Wireless Installation," by G. Reid.
 December 15th.—Visit to Glasgow Central Station.
 December 20th.—Discussion on "Fuses and Circuit Breakers," Messrs. McDougall and Toppin.
 January 10th, 1918.—"Small Private Plants," by G. T. Morrison.
 January 15th.—Visit Globe Sugar Refinery.
 January 24th.—"D.C. Machine Faults," by J. A. Kinnaird.
 February 7th.—"Armature Winding," by W. R. Scott.
 February 21st.—"Notes on Electric Furnaces," by F. H. Whysall.
 February 23rd.—Visit to Merino Mill.
 March 7th.—Juniors' night.
 March 21st.—"Production of Iron and Steel," by A. Norwell.
 March 28th.—General meeting.
 March 30th.—Visit M'Alpine's Lead Works, Govan.

Institution of Electrical Engineers. The first ordinary meeting of the session of the WESTERN LOCAL SECTION will be held at Cardiff, on Monday, November 12th, when the chairman, Mr. R. Howard Fletcher, will deliver his inaugural address. The annual general meeting is provisionally fixed for March 11th, at Bristol, and it is proposed to invite Messrs. P. N. Bireham and I. Jorgensen to read a paper on "Electroculture" on that occasion. The advance programme of the session of the SCOTTISH LOCAL SECTION, so far as decided, is as follows:—

November 13th (Glasgow).—Chairman's inaugural address, Mr. A. Page.
 December 11th (Glasgow).—"Gas-Firing Boilers," by T. M. Hunter.
 January 8th (Edinburgh).—"Electric Cooking as Applied to Large Kitchens," by W. A. Gillott.
 February 12th (Glasgow).—Kelvin Lecture. "Kelvin as a Teacher," by Prof. Magnus Maclean.
 March 12th (Edinburgh).
 April 9th (Glasgow).

The opening meeting of the session of the MANCHESTER LOCAL SECTION will be held next Tuesday, at 7 o'clock, at the Engineers' Club, Albert Square, when Mr. C. J. Beaver (the chairman) will deliver his address. Other arrangements for the session are as under:—

November 27th.—"Gas-Firing Boilers," by T. M. Hunter.
 December 11th.—"Electrical Cooking as Applied to Large Kitchens," by W. A. Gillott.
 January 15th, 1918.—"Electrical Signalling and Control on Railways," by C. M. Jacobs.
 Other meeting dates are:—January 20th, February 12th and 26th, March 12th and 26th, and April 9th.

Junior Institution of Engineers.—The annual general meeting is to be held at the offices, 39, Victoria Street, London, S.W., on Monday, November 26th, at 7.30 p.m. A paper by Mr. D. C. Boyd on "Die Making, Press Tools, and Tin-box Manufacture" will follow.

The report of the Council for the past year shows that the membership at September 30th was 1,306, a decrease of 23. Of the members serving with the Forces, 19 have been killed in action; 257 are in service. In the November issue of the *Journal*, an illustrated paper on "Mechanical Artificial Arms," by Mr. E. W. Hobbs, is printed.

Institution of Mechanical Engineers.—The Thomas Hawksley Lecture on "Heat Engines," by Captain H. Riall Sankey, C.B., R.E., will be delivered on Friday, November 30th, at 6 p.m., at the Institution of Civil Engineers.

Royal Society.—The following have been recommended by the president and Council of the Royal Society for election at the anniversary meeting on November 30th:—President, Sir Joseph Thomson; treasurer, Sir Alfred Kempe; secretaries, Prof. A. Schuster and Mr. W. B. Hardy; foreign secretary, Prof. W. A. Herdman.

Röntgen Society.—The subject of Capt. G. W. C. Kaye's presidential address delivered on Tuesday evening was "The Part Played by X-rays in the War."

To-morrow, at the Swansea Public Library, Mr. A. J. Stanton, A.M.I.E.E., is giving an address, with lantern demonstrations, on "Organised Effort."

The Effect of the War on Municipal Engineering and Public Health.—In association with the Chadwick Departments of Municipal Engineering and Hygiene, an introductory lecture was given at University College, London, by Mr. H. Percy Boulnois, M.Iust.C.E., on this subject. Mr. Boulnois said it was doubtful whether the general public fully appreciated the important bearing which municipal engineering had upon their daily life and health. The war had, perforce, stopped a number of municipal works which were in process of construction, but all the obligations arising out of the war had been in nearly all cases satisfactorily settled without recourse to the Law Courts. That was entirely due to the good feeling which existed between the contractor and the local authority owing to the crisis into which this country had been plunged. With regard to any detrimental effect upon public health, he did not think so far as he could ascertain, that up to the present time there had been any such effect due to the compulsory closing down of these works. He doubted if the general public realised the amount of quiet and unostentatious work that had been carried out for their benefit owing to the momentous changes produced by the war. Nor must it be forgotten that this work had been carried out with greatly depleted staffs. With regard to street lighting, the lecturer said there was now more light thrown on the surface of the streets without showing more light upwards, by means of more scientific darkening of the lanterns, and by reducing the candle-power of the burners. He thought the darkening of our streets

would lead to a much more scientific arrangement with regard to street lighting. Street lighting was, as a rule, unscientifically considered. "You want," he said, "to diffuse light. Now you have a diffused light—just what is really wanted." On the question of housing, Mr. Boulnois decried State aid as contrary to the principles of political economy, and advocated the promotion of some form of legislation to compel all employers to provide accommodation for their employes, if no other means were available.

Sir Maurice Fitzmaurice, in proposing a vote of thanks to Mr. Boulnois, said the subject with which the lecturer had dealt was really almost a part of the very important subject of Reconstruction. He thought there were very few who really realised what the great extent and cost of reconstruction was going to be after the war. Let them consider the reconstruction which would be necessary on the railways in this country, the Overseas Dominions, and all foreign countries, the roads, water supply, drainage, housing, new works for electric lighting and power, development of our agriculture and of all our natural resources—all these things were going to cost money. Particularly in municipal matters it would be very important that we should make up for lost time. London, perhaps, was better off than most municipalities in that way, but, to mention only one glaring thing in London, their supply of electric current for lighting and power, split up, he thought, among 28 different stations, was, in his view, a perfect scandal to the country.

Empire Trade Organisation: the Australian Scheme.—The London newspapers have published dispatches from Australia summarising a scheme unfolded by Mr. Hughes, the Australian Prime Minister, on Monday last, for organising industry in readiness for after-the-war operations and competition. Mr. Hughes sees that there will be a great economic struggle between the nations, and that industrial upheavals—possibly financial chaos—will result, with vital effects for the British Empire. It is therefore essential for the nation to organise, so as to bear the burdens imposed by the war and so as to deal with the many inevitable and complex problems. The speaker gave in outline his proposals for setting up a great national organisation for Australia. Each industry must have its own organisation, and there must be a general Council of Commerce composed of representatives of these separate Associations. Other parts of the scheme include the appointment of a Minister of Commerce, the setting up of a permanent Science and Industry Bureau, also a Department of Trade, and the appointment of trade representatives in the Overseas markets. There would thus be one Federal Department which would overlook such matters as scientific production and would study possible markets. Even at a cost of £250,000 per annum such an organisation would be well worth while. He emphasised the need for collective action in place of our past individualist policy.

Engineers' Wages.—The Committee of Production has issued an award giving a further advance of wages to all grades of workmen engaged with members of the Engineering Employers' Federation, bringing up the total war-time increase to 20s. per week.

Electrical Rain-Making in Australia.—According to the *Sydney Sunday Times*, the first official news of the success of Mr. Balsillie's efforts to induce rainfall was given to the public by the Minister for Works and Railways (Mr. Watt) on his return to Melbourne from a trip along the route of the Transcontinental Railway. In a brief statement which he made to the Press, the Minister said that after a visit to Bookaloo, and an examination of the records obtained, he was much struck with the results of the experiments, and was satisfied that the tests should be taken further. He had, therefore, decided to install two other stations, one in New South Wales and one in Victoria.

What the Minister learned on his visit to the plant at Bookaloo was that the rainfall was 50 to 70 per cent. above that of the surrounding country, and the area affected by the operation of the plant appeared to be approximately 350 sq. miles.

While Mr. Watt, by reason of his position as a Minister of the Commonwealth, has to take a conservative view of the experiments, others who have only themselves to please in the matter have expressed themselves satisfied with the results obtained by Mr. Balsillie, and have given him orders to install rain-making plants on their stations in the arid districts of Australia. Mr. Balsillie has entered into a contract that he is only to be paid by results. The more rain there is over the average yearly fall, the bigger will be the cheque at the end of the term.

The scheme has been protected in every country in the world, with the exception of Germany and the nations allied with her.

Careful research showed the inventor that in fine weather there was a charge of positive electricity in the higher regions of the air, and that when it rained negative electricity predominated. He was studying the effects of mountains on rainfall, and came to the conclusion that hills acted as conductors of the negative electrical energy with which the earth's surface is charged. He argued that all that was necessary, therefore, to give flat plains the same advantage as regards rainfall as hilly country, was the free passage of the negative electricity to the higher regions of the air. His rain-making plant now consists of a set of two or three kites, which are let up on galvanised flexible wire to an altitude of between 4,000 and 6,000 ft. The negative current is taken from the earth by means of a terminal, which is well grounded. Of course, the first essential in the business is wind. In his tests at Bookaloo and elsewhere, Mr. Balsillie has found that rain invariably falls after the kites have been in the air for from six to ten hours.

In addition to the testing station on the Transcontinental Railway line, another station is being established in the Northern Territory for Government experimental work.

Patent Law.—At the opening meeting of the London Section of the Society of Chemical Industry on Monday, a paper on patent law and British chemical industry was read by Dr. F. W. Hay, patent expert of British Dyes, Ltd., who expressed the view that the novelty of all inventions to be protected by patents should be investigated by the Patent Office by means of a general system of examination, covering all prior British and foreign publications. He further proposed that the public should be allowed five years within which the patent could be revoked on various grounds, and the validity of the patent should then no longer be open to attack in Court, so as to give greater serenity to any new manufacture depending on patent rights. He also suggested that all actions connected with infringement of patent rights should be tried in the presence of a technical jury consisting of experts engaged in the industry or science to which the action related, the Judge being required to submit the issue of infringement to the jury.—*Morning Post*.

Wages of Australian Tramway Men: Arbitration.

Australian papers just to hand show that in August last arbitration proceedings were commenced by Mr. Justice Higgins respecting the claim of the Australian Tramway Employés' Association against tramway companies and others in the various States seeking increased wages and better conditions of work. The respondents who put in an appearance were the Prahran & Malvern Tramway Trust, the Hawthorn Tramway Trust, the Melbourne, Brunswick & Coburg Tramway Trust, the Hobart Council and the Kalgoorlie Electric Tramways, Ltd. It was announced that agreements had been signed and the plaint withdrawn as against the Melbourne Tramways Board, the North Melbourne Electric Tramway & Light Co., the Electric Supply Co. of Victoria, the Northcote Council, the Fremantle (W.A.) Municipal Tramway & Electric Light & Power Co., which were amongst the original respondents. The Association made the following claims, amongst others, for wages:—Shunters, dray drivers, orderlies, lavatory men, office porters, and labourers, the basic rate of 11s. a day; horse car drivers, 11s. 6d. a day; conductors, tramcar drivers, signalmen, 12s. 6d.; signalmen in charge of levers, 13s.; engine drivers, 13s. to 17s.; firemen 13s. to 13s. 6d.; trimmers, boiler cleaners, 12s.; and other classes of workers from 12s. to 15s. a day. Employés at Kalgoorlie asked for 15 per cent. above these rates. A 44-hour week was asked for in the plaint, but it was stated that the employés would consent to a 48-hour week. Annual leave was asked for by the employés of 21 days each year on full pay. It was stated that agreements had been come to with many of the respondents in respect to various conditions of work to be performed by the employés, and that understandings on other points might follow. In answer to his Honour, several of the respondents declined to admit that there was a dispute extending beyond the limit of one State, and it was intimated that this matter would have to be determined latter on in High Court jurisdiction.

The taking of evidence was commenced.

Technical and Commercial Libraries.—The interim report of the Council of the Library Association on the Provision of Technical and Commercial Libraries has been issued, and includes the following recommendations, which have been laid before the Department of Scientific and Industrial Research:—

(a) The removal of the existing limit to the library rate, so that local authorities may be free in future to expend upon their libraries the sums necessary for their greater efficiency.

(b) A closer union between State and Copyright Libraries on the one hand and Municipal Libraries on the other, so that the resources of the former may directly or indirectly be made available for scientific and technical students in the provinces.

(c) That funds should be provided for some State-supported library, such as the Science Library of South Kensington, or a library controlled by the Department of Scientific and Industrial Research, to purchase books required for research, and to make them available for loan to public libraries.

The Association is of opinion that it is of urgent national importance to increase the supply of scientific and technical books and periodicals as suggested in paragraph (c), and that local authorities should afford more generous support to public libraries for the provision of scientific and technical literature. Commercial departments should also be established in libraries in trading and industrial centres, and special collections of books brought together and classified. The co-operation of the B. of T. Commercial Intelligence Branch to this end is suggested, and the valuable services rendered to American commerce by the Philadelphia Commercial Library, which answers inquiries on trade matters by telephone and correspondence, are cited as an example of what should be done here. But Library Committees must be prepared to pay higher salaries to assistants capable of doing such work. We are glad to see that the Association holds such advanced opinions, with which we cordially agree, and it is taking steps towards realising the proposals above described.

Storage of Coal (in Bulk).—The British Fire Prevention Committee has issued a special "Warning" (No. 31) with regard to the storage of coal in bulk, with especial reference to spontaneous combustion. The following are some of the precautions that should be taken:

(a) Stacks should not be higher than 10 ft.

(b) Iron perforated pipes 3 or 4 in. in diameter, or, failing these, either suitable earthenware pipes or ducts formed of incombustible material should be inserted vertically in the stacks as they are built up. The lower ends of these pipes or ducts should be at different heights from the ground throughout the stacks. There should be one pipe or duct to about every 300 sq. ft. of surface.

(c) A thermometer should be lowered occasionally through these pipes or ducts to ascertain the temperature at the centre of the stack.

(d) If wet, very small, very soft, or impure coal is received, it should be dumped around the edges of the stack, or in some location where the air can get to it freely, and where other coal will not be packed on top of it.

Matches should always be used carefully, and should not be thrown down until extinguished. Safety matches are preferable to any others. The funnels of steam lorries, &c., should be fitted with spark arresters, and similarly the flue pipes to any stoves near the coal stacks.

When a coal yard is working at pressure, more than ordinary care should be taken to keep the premises clean, and to see that there is no accumulation of waste or rubbish. Oily rags from lorries especially should be placed in iron or metal-lined receptacles, and removed every night. Particular care should be taken to guard against any hot ashes from steam lorries, or accumulation of petrol or oil drippings from motor vehicles generally.

Fire appliances should be installed, and properly overhauled weekly by a competent employé or watchman, and kept ready for instant use. Additional fire appliances above the usual supply should be provided where the pressure of work is exceptional. In large yards hydrants with an ample supply of hose to cover the whole of the premises should be provided. Particular care should be taken in frosty weather to prevent mains, hydrants, or hand fire appliances being affected.

Coal should not be stacked against buildings, boundary walls, or wood fences, &c., as the pressure may be considerable, and such structures collapse with serious results.

Buckets of water should always be available, also buckets or bins of dry sand with scoops where oil or spirit is used.

Copies of the notice can be obtained on application in writing to the Registrar at the offices of the Committee, 8, Waterloo Place, Pall Mall, London, S.W. 1. enclosing a stamped addressed foolscap envelope.

Electro-Harmonic Society (Season 1917-1918).—The next Concert (Ladies' Night) will be held at the Holborn Restaurant, in the Venetian Chamber, on Friday next, November 16th, at 6.15 p.m. Colonel A. M. J. Ogilvie, C.B., will preside. The list of artistes is as follows:—Miss Annie Rees, soprano; Miss Dorothy George, contralto; Mr. Thomas Howell, baritone; Mr. Walter Churcher, humorous recitals; Mr. Arthur Brough, ventriloquist and child mimic; Miss Rene Haslam and Mr. Fred Rome, cameo conversations; Mr. Ernest Hastings, entertainer at the piano; Mr. Bernard Flanders, A.R.A.M., pianoforte solo and accompanist.

Automatic Railway Sub-Stations.—A recent article in the *Electric Railway Journal* mentioned that a dozen or more automatic sub-station equipments have been installed by seven different electric railways in America, and some 30 other equipments are under construction by a single manufacturer. The apparatus is designed to do the work of the operator, and, in addition, automatically to limit the amount of current taken from the machine.

This portion of the equipment consists of a load-limiting resistor, which is automatically inserted between the machine and station bus when excessive peaks occur by reason of high acceleration, &c.; where individual feeder protection is required, a portion of the resistance is inserted in the outgoing feeders. Equipments are under construction for automatic stations ranging from 200 to 1,500 kw. It is calculated that in the case of a hypothetical line having four sub-stations of 300 kw. capacity each, and operating a car service on a 2-hour headway, the total saving per year would amount to \$6,608 (£1,321), comprising \$1,680 (£936) wages and \$1,928 (£386) energy. One day and one night inspector only would be required to supervise the equipments; in the case of the Des Moines City Railway it is considered that these two officials will have ample time to look after the operation of the 16 automatic converter stations eventually to be installed, which, in view of labour shortage, should be especially attractive to the company.

Causes of German Coal Shortage.—The *Labour Gazette* states that the chief causes of the present inadequate output of coal in Germany are discussed in an article in *Die Konjunktur* of August 30th:—"Among those given are the underfeeding of the miners, their lack of experience and training, the unsatisfactory terms of the collective piecework contracts, lack of zeal in the workers, defective ventilation, poor blasting materials, defective tram lines, and general shortage of trams, timber and other materials. By way of illustrating the decline in the standard of efficiency of the mining staffs, the following figures are given: At the outbreak of war the Prussian mines had at their disposal a total of 767,175 fairly well-trained workers, of whom 7,205 were women and 31,290 were lads under 16. In the first quarter of 1917 the total number of workers in the Prussian mines (exclusive of prisoners of war) was 593,722, of whom 40,842 were women and 11,197 lads under 16. Thus the percentage of women and lads had risen from 5.02 to 13.82. During the second quarter of 1917 the total number of workers has increased somewhat, and if prisoners of war be included, it falls but little short of the peace-time number. Thus there is quantity, but not quality. At the present time quite one-sixth of all employed in and about the mines are made up of women and lads, lacking both in physical strength and in training. But even among the men a large proportion are unskilled people, recruited from every conceivable vocation. If the prisoners of war be included, the effect is to reduce the average efficiency of the mass still further."

Co-operation in Export Trade.—The club dinner of the Engineers' Club, Manchester, held on Tuesday last, was followed by a debate on "Co-operation in Export Trade." Captain L. E. Mather presided, and the debate was opened by Mr. L. A. Paish, of the Department of Commercial Intelligence, who recently addressed the Birmingham Brass Masters on the subject of trading combinations.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—Mr. HOWARD FOULDS, having accepted an appointment with an electrical company in London, has resigned the secretaryship of the Birmingham Corporation electricity supply department. The Committee has appointed a sub-committee to consider the appointment of a successor as from the beginning of the New Year. Mr. Howard Foulds has been secretary of the undertaking for the past seven years. The Committee adopted, at its last meeting, a resolution expressing regret at Mr. Foulds's severance from the work in Birmingham, and its high appreciation of his services to the department.

West Ham E.L. Committee recommends that the under-mentioned officers be granted an increase of 15 per cent. on their pre-war salaries as under (less any merit increases which have been granted since the commencement of the war), to date from October 1st, 1917:—Mr. J. Allan, station superintendent, £400; Mr. F. Farndon, sales manager, £400; Mr. W. A. Gilbert, mains engineer, £325; Mr. W. E. Edgerton, assistant sales manager and meter superintendent, £285; Mr. H. Smith, departmental accounts clerk, £240; Mr. H. B. Johnson, chief clerk, £220; Mr. E. Tombs, stores manager, £200 (increased since the war to £220); Mr. G. D. Bendix, assistant station superintendent, £250; Mr. W. Whitney, assistant mains engineer, £215 (increased since the war to £240); Mr. W. S. Cobb, station foreman, £208 (increased since the war to £221). It is further recommended that the following increases be given:—Mr. R. Snell, assistant meter superintendent, from £3 12s. 9d. to £4 2s. 9d.; Mr. H. P. Irons, installation inspector, from £3 2s. 6d. to £3 12s. 6d.; Mr. A. H. Gibbs, jun., assistant timekeeper, from £2 9s. to £2 14s.

Committees of Sheffield City Council favour the following increases in salaries:—Mr. A. R. Fearnley, general manager, tramways and motor department, present salary of £1,000 a year to be raised by two annual increments of £100 each; that the maximum salaries of shift engineers in the electric supply department be increased to £220 per annum; and that the salaries of the following shift engineers be raised by £20 per annum in each case:—Mr. H. Price, present salary £170; Mr. W. H. Smith, present salary £160; Mr. T. Roberts, present salary, £150.

General.—LORD CARMICHAEL, G.C.I.E., K.C.M.G., has accepted a seat on the board of the British Thomson-Houston Co., Ltd.

Mr. J. N. JARDINE, who has taken up a Government appointment abroad, has been presented by the electrical department of Messrs. Bean & Son, Dudley, with a pair of field glasses in leather case.

On the occasion of resigning his position as electrical engineer with the Banknock Coal Co., Stirlingshire, to take up a position in England, Mr. ANDREW WALKER was presented with a Gladstone bag and a wallet containing Treasury Notes as a parting gift from the employés.

From a recent minute of the Sydney Municipal Council it appears that Mr. J. DAVIS, Director-General of Public Works, is about to retire from his present position, with the intention to practise privately as a civil engineer in London. Mr. Davis has served the State for many years. The State Government has arranged with him to inspect and arrange for the importation of machinery and other articles required in connection with the public service of the State, and in respect of his services in this connection payment will be made by commission. The Lord Mayor suggests that the Municipal Council would be well advised to retain Mr. Davis as its representative in Great Britain. The Council at the present time has as its consulting and inspecting engineers for the electricity supply department Messrs. Preece, Cardew, Snell and Rider, and it is not proposed to make any change in this connection. In addition to opening an office in London, Mr. Davis will have assistants in the centres of industry in Great Britain and a representative in the United States, whose services will also be placed at the disposal of the Council.

Mr. J. E. DOBSON, late Scottish representative of Messrs. Bruce Peebles & Co., Ltd., Edinburgh, has been appointed London office manager to the company, in place of the late Mr. R. W. Ganttlett, and has now taken up his new duties at Hastings House, Norfolk Street, Strand. Mr. Dobson's many friends, both in Scotland and elsewhere, will wish him success in his new appointment.

Roll of Honour.—Lieutenant E. G. BAKER, Loyal North Lancs. Regiment, who has been wounded in the head, and is lying in the 2nd Southern General Hospital, Southmead, Bristol, was employed at the Morecambe electricity works.

Sapper A. J. WILLIAMS, R.E., who has fallen in action, was engaged at the works of Messrs. Siemens Bros., Stafford.

Private C. W. TEW, Grenadier Guards, who was engaged in the winding shop at the Stafford works of Messrs. Siemens Bros., has been killed by a shell.

Sapper P. COBB, R.E., who has died from wounds, was in the dynamo shop at the Queen's Engineering Works, Bedford.

Corporal G. H. TOMPKINS, Oxford and Bucks. Light Infantry, who has died of wounds and the effects of gas, was in the Coventry works of the B.T.H. Co.

Lance-Corporal H. L. TENNANT, Lancashire Fusiliers, who has been killed, was employed by Messrs. Davenport, Sparrow and Co., electrical contractors, Manchester.

Private W. E. G. STANLEY, Lancs. Fusiliers, reported killed, was employed at the British Westinghouse Works, Trafford Park.

Private D. GREGORY, Border Regiment, killed in action, was employed by Messrs. W. T. Glover & Co., Ltd., Trafford Park.

Driver J. WARD, R.F.A., killed in action, was employed in the generating station of the Stalybridge Joint Tramways and Electricity Board.

The funeral took place at Darwen Cemetery, on November 1st, of Lance-Corporal J. POOLE, K.O.R.L. Prior to enlistment he was employed at the Blackburn electricity works. The funeral was attended by a firing party of 18 men from Preston. Included in the floral tributes was one from deceased's fellow employés at the electricity works.

Private G. WATSON, of the Australian Force, who has been killed in action, was employed in Australia as an electrician.

Private W. W. HOLEY, Royal Warwickshire Regiment, who has been mortally wounded while serving as a stretcher-bearer, was an electrical engineer, of Whitby.

The following honours have been awarded to the employés of the Stepney B.C. Electricity Committee:—Lieut.-Col. G. G. Ewer (sales engineer), D.S.O.; Lance-Corporal H. O. Hendry (clerk), Military Medal; Sapper E. Jones (showroom assistant), Military Medal. It is feared that Lance-Corporal Hendry has been killed. The Committee has conveyed its congratulations to Lieut.-Col. Ewer and Sapper Jones, and to the father of Lance-Corporal Hendry.

Private J. ANDERSON, formerly an apprentice in the Glasgow Corporation electricity department, has been killed in action.

Private J. S. WEAVER, formerly engaged in the Leeds tramways accounts department, has been wounded.

Corporal J. HYLAND (20), South Lancashire Regiment, has fallen in action. He was employed by Mr. H. Barber, electrical engineer, Birmingham.

Mr. R. H. Dickinson, chief engineer to the Birmingham Corporation tramways, has received official information of the death of his eldest son, the Rev. HARRY DICKINSON, Chaplain to the Artists' Rifles, Vicar of St. Stephen's, Birmingham.

Obituary.—MR. WILLIAM DU BOIS DUDDELL.—It is with the deepest regret that we record the death of Mr. W. Duddell, which took place on November 4th, after a long illness, at the early age of 45. Mr. Duddell was one of our most brilliant and successful investigators, and stood in the foremost rank of British scientific engineers, a position which he won before he was 30. A thoroughly practical engineer and expert mechanic, he designed and made the first successful oscillograph, and thus opened the way to a new mode of observation which has proved of priceless value to the electrical industry. He also studied the physics of the A.C. arc to excellent purpose, and laid the foundation on which the continuous-wave system of wireless telegraphy and telephony was built up. In conjunction with Prof. Mather, he perfected a standard wattmeter, and he devised thermally-operated ammeters of extraordinary delicacy and ingenuity for measuring minute antenna high-frequency currents, &c. His researches in wireless telegraphy were no less brilliant than his other work. Following Dr. Ferranti, Mr. Duddell for two years occupied the chair of President of the Institution of Electrical Engineers; he was past-president of the Röntgen Society, and was appointed a member of the Admiralty Board of Invention and Research, as well as of the Inventions Board of the Ministry of Munitions. He was made a Commander of the Order of the British Empire in August last, and five years ago he was awarded the Hughes Medal of the Royal Society, of which he was a Fellow. He was a member of the Advisory Council for Industrial Research. The full extent of his services to the Institution of Electrical Engineers will never be known except to those who collaborated with him, and during the war he had been engaged upon work of the first importance to the nation. Further particulars of his career will be found in our issue of November 8th, 1912, together with his portrait. By his early decease the electrical profession has suffered a heavy blow; his friends are no less grieved at the loss of his engaging personality and charming courtesy.

MR. W. NOBLE.—Mr. Wilson Noble, formerly M.P. for Hastings, who has died at the aged of 63, was interested in electrical research, and for nine years acted as President of the Röntgen Society of London.

NEW COMPANIES REGISTERED.

Agence Havas (1,621r).—Particulars filed October 15th, 1917. Incorporated in France, July 17th, 1879. News and advertising agency. London addresses:—(Telegraphic information) 24, Old Jewry, E.C., (advertising department) 105, Cheapside, E.C. Directors: J. C. M. Lefebvre, H. L. Houssage, J. B. Faivre, C. E. C. A. Houssage, C. A. O. Guistiniani, A. C. Meynet, J. M. Laffite, F. J. E. Barbier, and E. Lebey, all of Paris. Gustave Hirsch de la Mar, 24, Old Jewry, E.C., and Gaston Poinant, 105, Cheapside, E.C., are authorised to accept service.

Lo-Thermo Patents, Ltd. (148,701).—Private company. Registered October 18th. Capital, £1,000 in £1 shares. To acquire from Electromotors, Ltd., B. Longbottom, and E. Greenhalgh the benefit of certain inventions relating to dynamo-electric machinery, and to carry on the business of electrical engineers and contractors, manufacturers of, and dealers in, railway, tramway, electric, magnetic, galvanic, and other apparatus, &c. The subscribers (each with one share) are:—B. Longbottom, Thornville, Alderley Edge, managing director; E. Greenhalgh, Harewood, Birchfield Road, Rusholme, Manchester, electrical engineer. The first directors are:—W. T. Stubbs, B. Longbottom, and E. Greenhalgh. Registered office: 61, Brown Street, Manchester.

Lincolnshire Motor & Electric Traction Co., Ltd. (148,735).—Private company. Registered October 24th. Capital, £5,000 in £1 shares. Objects, as indicated by the title. The subscribers (each with one share) are:—S. A. Fuller, 13, Abbey Drive East, Grimsby, electrical engineer; C. A. B. Turner, 11, Hainton Avenue, Grimsby, farmer and engineer; N. Green, Holbeck Manor, Horncastle, steam trawler owner. The first directors are:—S. A. Fuller, C. A. B. Turner, and N. Green. Registered office: 5, Wellowgate, Grimsby.

Supply Association Among Metallurgists and Machine Makers (C.A.M.M.) (1,624r).—Particulars filed October 24th, 1917. Registered in Italy. Objects: The direct purchase of raw materials on behalf of associates in Italy and abroad, &c. Capital unlimited. Shares are of lire 100 each nominal value. British address: 26, Portugal Street, W.C.2, where J. H. Pearson, London manager, is authorised to accept service.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Dublin United Tramways Co. (1896), Ltd.—Particulars of £2,600 debenture bonds created August 7th, 1917, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The undertaking of the company, and all the tolls and sums of money arising by virtue of the Dublin United Tramways Acts, 1881 and 1905. No trustees. Registered October 20th, 1917.

Direct West India Cable Co., Ltd. (53,956).—Capital, £120,000 in £5 shares. Return dated October 11th, 1917. 12,000 shares taken up; £3 15s. per share called up. £45,000 paid. Mortgages and charges: Nil.

Electric Supply Corporation, Ltd. (52,036).—Capital, £250,000 in £5 shares. Return dated July 19th, 1917. 42,500 shares taken up; £175,000 paid on 35,000 shares; £35,000 considered as paid on 7,000. Mortgages and charges: £154,914.

Exchange Telegraph Co., Ltd. (6,152).—Capital, £96,430 in 8,023 "A" shares of £10 each and 16,200 "B" shares of £1 each. Return dated August 10th, 1917. All shares taken up; £64,046 paid, being £10 per share on 6,000 "A" and £2 per share on 2,023 "A"; £32,384 considered as paid, being £1 per share on 16,200 "B" and £8 per share on 2,023 "A." Mortgages and charges: Nil.

Bombay Electric Supply & Tramway Co., Ltd.—Capital, £1,320,000 in 72,000 ord. and 60,000 pref. shares of £10 each. Return dated April 25th, filed October 9th, 1917. 72,000 ord. and 60,000 pref. shares taken up; £10 per share called up on 60,000 pref. and 45,000 ord.; £1,049,956 paid, leaving £36 in arrears; £270,000 considered as paid on 12,000 ord. and 15,000 pref. Mortgages and charges: £723,000.

Llangollen and District Electric Light & Power Co., Ltd.—Capital, £66,000 in 3,500 ord. and 2,500 pref. shares. Return dated October 8th, 1917. 2,114 shares taken up; £1 per share called up on 2,114; £2,110 15s. paid, leaving £3 5s. in arrears. Mortgages and charges: £3,000.

Fors Accumulator Foreign Patents, Ltd.—Capital, £3,000 in 952 pref. and 2,048 ord. shares of £1 each. Return dated January 11th (filed August 8th), 1917. 584 pref. and 2,048 ord. shares taken up; £132 paid on 132 pref.; £2,500 considered as paid on 452 pref. and 2,048 ord. Mortgages and charges: £125.

Dublin United Tramway Co. (1896), Ltd.—Particulars of £3,200 mortgage bonds redeemable September 29th, 1922, created August 7th, 1917, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The undertaking of the company, and all the tolls and sums of money arising by virtue of the Dublin United Tramways Acts, 1881 and 1905. No trustees. Registered October 20th, 1917.

Harry H. Gardam & Co., Ltd.—Mortgage dated October 24th, 1917, to secure £2,500, charged on freehold land and hereditaments at Staines. Holder: J. Ashby, J.P., D.L.

Gavan Inrig, Ltd.—Particulars of £200 debentures created October 11th, 1917, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including unclaimed capital. No trustees.

Milton Manufacturing Co., Ltd.—Memorandum of satisfaction in full on October 10th, 1917, of mortgage and Land Registry Charge dated December 20th, 1916, securing £2,000, has been filed.

CITY NOTES.

The directors report that frequent interruptions occurred in 1916, some of which were at great depths. Six interruptions took place in the cable from Brest to Saint Pierre, two in the case of the Brest-Cap Cod cable, and even a simultaneous interruption in the two cables for 15 days was recorded. During the fine weather it was possible to remove

from the Brest-Cap Cod cable a fault which had prevailed at great depths for some years past, and a second existed which still interfered with the handling of the traffic. Notwithstanding these facts, the traffic receipts on the trans-Atlantic cables were higher than those in 1915. In the net work in the West Indies the receipts increased in 1915 by 28 per cent. over those in 1914, and in 1916 the augmentation was 20 per cent. over 1915, and 54 per cent. as compared with 1914. The reasons were to be found in the general situation which had caused an expansion in messages, and in the restrictions imposed on the use of codes. In Venezuela, in particular, the receipts experienced a material increase, and the service between that country with external countries was certain and regular, thanks to the new cable between San Domingo and Porto Rico, which had permitted of the doubling of the land line from San Domingo to Puerto Plata, Venezuela, and the Greater Antilles.

The receipts from the land network in the Dominican Republic were slightly less than in 1915, when they were exceptionally high. In this connection, the United States military authorities, who were in occupation of the country, had undertaken the working for their own account of the wireless station at San Domingo, and also for private messages. The company had succeeded, however, through representations made by official circles, in securing the use of the station to be limited solely to the requirements of the military authorities. The company's claims for indemnities arising from the injury caused during the revolutionary troubles in the course of recent years were to be investigated, together with other French claims, by a commission who were appointed this year (1917). The receipts from the cable between New Caledonia and Australia experienced a slight increase, whilst the subsidies and guarantees reached £25,800, as against £25,900 in 1915. The subsidy from Dutch Guyana continued to be received, but great difficulties were met with in obtaining the subsidy due from the Government of Hayti, which was under the financial control of the United States as a result of an agreement concluded in 1915. The arrangement made with the French Minister for the Colonies in regard to the litigation concerning the subsidies of the French Guyana, the Martinique and Guadeloupe, was in course of execution, and the company had received a considerable amount of the subsidies which were in dispute.

The financial benefit derived by the French Government from the free transmission of official messages, which was represented by £37,000 in 1915, rose to £57,000 last year, whilst terminal and transit charges and taxes and other charges yielded a further sum of £29,000 to the State. If the gratuitous forwarding of State messages results in a considerable saving to the Government, the directors recall the fact that the service at the same time increases the company's working expenses and diminishes the capability of transmitting paying traffic. The net profits are returned at £144,000, which sum has permitted of the repayment to the State of £70,000 arising from the debt incurred under the Government guarantee, and the distribution among the shareholders of a dividend of 11.08 fcs. per share, or a total of £23,800 among 53,702 shares of £10 each, the total ordinary share capital being £537,020.

The Zurich Bank for Electrical Undertakings.

The report of the Bank für Elektrische Unternehmungen, of Zurich, which deals with the year ended on June 30th, 1917, states that the difficulties caused by the war placed an increasingly oppressive burden both on belligerent and neutral countries, and trade and industry in nearly all countries had more and more been devoted to war requirements. As a consequence of their adaptability, the electricity works would have suffered less if constructional and raw materials had not become scarcer and more costly. The unfavourable situation of the works using coal continued, and a considerable increase in the costs had also now taken place, even in those districts where coal mines are to be found. The total result was that it was almost impossible to carry out renewals and extensions, and owing to the great wear and tear brought about the work of replacement would assume considerable dimensions after the war. This state of affairs was already still more noticeable in the case of tramways than in that of the electricity works. The depreciation of money and the dearth of commodities had led to increases in the wages of the employees, which, together with the higher taxes, had prejudiced the financial results, and this would also have to be reckoned with after the war. As a consequence, efforts were being made by the electricity works to obtain an increase in prices, and by the tramway companies in the passenger fares. Of the companies closely associated with the bank, only the Electric Co., which supplied the Roumanian petroleum industry with current, had suffered not inconsiderable material damage through the war, and the hope was expressed that the endeavours to secure compensation would be successful.

The directors refrain from making any definite prediction as to the prospects of electrical undertakings in the near future, although the hope is entertained that the existing difficulties would be overcome in the course of a few years after the termination of the war. The hope also might be cherished that the ratio between receipts and expenditure would again approach normal conditions through a reduction

in the working expenses and an increase in the sale prices for energy, and that this recovery would be facilitated by the constant growth in the use of electric power, since new applications for electricity had been opened up by the war, particularly in the electrochemical department, and especially as it had become generally admitted that small works were not economical, and that they must be connected with large works. All these considerations led to the expectation that undertakings which were sound internally, and established and worked on right principles, would again yield satisfactory results in a few years' time. After giving details of the numerous companies in which the bank is interested in different parts of the world, the directors report that the gross revenue amounted to £335,000, as compared with £459,000 in 1915-16, on an ordinary share capital of £3,000,000. The net profits, after defraying general expenses and interest charges on the loan capital of £3,790,000, are returned at £162,000, as contrasted with £258,000 in 1915-16, and the dividend is at the rate of 5 per cent., as against 8, 8, and 10 per cent. in the three preceding years respectively.

During the half-year ended at June last the company made a profit of £2,913, to which is added £5,965 brought forward. After paying 5 per cent. dividend and putting £1,000 to marine insurance account, £477 is carried forward. The war again prejudicially affected business, the acceptance of messages from the public being practically prohibited. Work in the manufacturing department was plentiful, so as to tax the resources of the company.

The annual meeting was held on August 30th, at Sydney, Mr. E. T. Fisk, the acting managing director, in the chair. The chairman expressed regret at the retirement of Mr. H. R. Denison from the position of managing director, because of the great demand made upon his time by other interests. Mr. Denison was one of the pioneers of wireless development in Australia. For the year, which ended on June 30th last, the profit was £7,453. A 5 per cent. dividend was recommended, and the reserves had increased to £20,500. The company had been able to pay a steady 5 per cent. dividend practically from its inception, in spite of the fact that progress in at least one important direction, that of "message traffic," was impossible during war time. The directors had followed a policy of carefully building up reserves for marine insurance, depreciation, and for patent rights. The position would improve as more of the available resources were employed in extending the company's operations. As a result of the policy of building up the manufacture of wireless telegraph apparatus in its own factory, the company had received some important orders from the Australian and New Zealand Governments. The company had recently gained the position which was undoubtedly unique in the history of Australian manufacture, of receiving a number of orders from England, Africa, India, and other places for the manufacture and export of complete wireless telegraph stations. The company's patent rights were being continually added to by means of the new inventions of Signor Marconi and his associates, all of which belonged, in Australian and New Zealand, exclusively to the company. Among the most recent patents acquired by the company was a new invention made by Marconi which had already been referred to in the newspapers. Only partial particulars had been received at present, and the matter was still confidential, but the invention promised to mark a new epoch in wireless communication equal to that brought about by Marconi's famous tuning invention of the year 1900.

The report for 1916 states that Dr. H. F. Parshall, the president and consulting engineer of the Ebro Irrigation and Power Co. and the Ferrocarriles de Cataluña, S.A., has issued a report showing that substantial progress has been made by the companies operating in Spain, and the results are satisfactory having regard to the conditions under which they were realised. The war makes construction everywhere more difficult and expensive, and this is especially true where a large quantity of the materials has to be brought from overseas. Nevertheless, the works outlined in Dr. Parshall's original report have been substantially completed. The continued high price of coal, however, has necessitated a considerable change of plans, and in view of the rapid growth of business it became necessary for the Ebro Co. to begin the construction of another hydro-electric power plant without further delay. It is not easy at present to raise new capital, but it is satisfactory to report that such financial provision has been made as will enable the Ebro Co. to carry on construction into 1918. Work on the new plant was begun in July last, and is being pushed forward as rapidly as possible. It is hoped that when complete it will furnish sufficient power to cover requirements for a number of years. The net revenue amounted to \$1,875,315, against \$1,316,282, and the interest on prior lien "A" bonds \$331,900, against \$96,355, leaving a surplus of \$1,543,415, against \$1,219,927. The results for the first six months of 1917 indicate a further large increase, and it is anticipated that this rate of increase can be maintained throughout the year. Under the plan approved by bondholders all surplus earnings from operation up to June 1st, 1918, were to be applied to further construction, all bond interest, excepting

that on the prior lien "A" bonds, being satisfied by the issue of 5 per cent. notes. As a result no profit and loss statement is published, as all earnings of the associated companies are applied as provided in the committee agreement. The share in the capital stock of the Tramways de Barcelone purchased by the company are still held as security for the balance of the purchase price, and will probably remain so until after the war. The application for a concession for unification which the Tramways Co. is making is still pending, and the managing director reports that there is reason to believe it will be granted in due course. The tramways earned a surplus over the dividend upon their common shares, which the company guarantees.—*Financial Times*.

Monte Video Telephone Co., Ltd. After providing for all charges in Monte Video and London, and making provision for income-tax and excess profits duty, the net profit for the year ended July 31st, 1917, is £25,324, against £25,985 for the previous year. The interim dividends paid in May absorbed £4,313, leaving £21,981, plus £5,691 brought forward. After applying £8,000 to depreciation of property and plant, transferring £9,000 to reserve for renewals, and paying final dividends of 2½ per cent., less income-tax, on the preference shares, and 3 per cent., free of tax, on the ordinary shares, making 5 per cent. and 6 per cent. respectively for the year, £6,332 remains to be carried forward. There has again been a satisfactory increase in the number of subscribers during the year.

Norwich Electric Tramways, Co., Ltd.—Dividend, 2 per cent. for the year, placing £8,000 to reserve, and carrying forward £39.

Isle of Wight Electric Light & Power Co., Ltd.—Owing to the reduced profits, the half-yearly preference dividend will not be paid until the results of the complete year are known.

Indian Electric Supply & Traction Co., Ltd.—Interim dividend of 2½ per cent.

STOCKS AND SHARES.

TUESDAY EVENING.

Stock Exchange markets remain quiescent. The news from the Italian front continues to bear rather depressingly upon most departments, the view being, of course, that any serious set-back in that quarter will have the effect, by prolonging the war, of causing fresh expenditure of men, material, and money, and therefore acting as a fresh drag upon the money markets of the world.

Financial conditions are none too comfortable in the United States and Canada at the present time. So far as the latter is concerned, a better tone has supervened within the past few days, and there is rather more support being given to the Canadian industrial concerns, including those of the electric power companies. At home, the tendency is to let prices droop a little in the absence of effective support. It would appear as though the public were refraining from investment just at present, because the returns of the amounts subscribed to the National War Bonds are not as large as might well be expected.

The home railway market is once more on the decline. Underground Electric Income bonds slipped back to 83, and the £10 shares to 35s. Metropolitan Consolidated weakened to 23, and most of the steam stocks are also lower. Meanwhile, the mild agitation continues for a more generous treatment by the Government of the railway stockholders in the matter of dividend payments. One correspondent wrote bitterly to an evening paper the other day, pointing out that on Metropolitan Consolidated his dividend for three years preceding the war was 1½ per cent. each year, whereas since that time he had received only 1 per cent., in spite of the fare-raising which has come into operation.

The London United Tramways Co. announces its intention of applying to Parliament for the right to raise its fares, and for power to abandon some portions of its lines in Middlesex and Surrey. Proprietors will probably be thankful to know that the directors are alive to the necessity for action to pull the company out of its present condition; the 4 per cent. debenture stock last changed hands at 32½ and 33 at the end of October. London and Suburban Traction ordinary are slightly better at 2s. 9d. The preference were done yesterday, Monday, at 7s., and the 4½ per cent. First Mortgage debenture stock at 61½ and 61. The most recent business marked in Metropolitan Electric Tramways ordinary was 10 days ago, at 1s. per share, the preference recording a bargain at 5s. at the same time.

Electricity Supply shares are unchanged, and amongst the manufacturing issues, General Electric ordinary at 18½ are 10s. up. India-Rubber shares are ¼ higher. British Westinghouse preference declined a similar fraction to 2 13/16. Babcock & Wilcox gave way to 3, and recovered to 3½.

British Columbia Electric Railway $4\frac{1}{2}$ per cent. debenture stock rose 4 to 55, on the expectation that, after all, the Municipality will recognise the fairness of the company's contentions with regard to competition. The preference stock is 2 better at 42 $\frac{1}{2}$. Canadian General common stock has improved to 115, the preferred to 110 $\frac{1}{2}$. Kaministiquia Power common is 122 $\frac{1}{2}$ ex div. The Mexican group leans to the lower side, though the changes are comparatively small. Brazil Tractions dropped another 2, to 42, Brazilians being dull all round. The preferred remains steady about 90. Brisbane ordinary are good at 6 $\frac{1}{2}$, and this is ex div.

It is a little unusual to have a fall to record amongst the best-class cable shares, but this week Eastern Extensions have eased off $\frac{1}{2}$ to 14 $\frac{1}{2}$. Westerns, however, are $\frac{1}{2}$ up at 15 $\frac{1}{2}$, while Eastern ordinary at 149 $\frac{1}{2}$ stands just between the two. Marconis are very quiet, with a dull tendency for choice. The parent shares gave way $\frac{1}{2}$; Americans are tolerably steady at 21s. 6d., Canadians at half-a-guinea.

Rubber shares keep a firm market, though business has been quiet. Raw rubber is a farthing or so lower at 2s. 8 $\frac{1}{2}$ d. per lb. The armament group is good, and iron and steel descriptions are mostly better. Round the Stock Exchange generally there is not much going on, and the next developments on the Italian front are awaited with keen interest.

Stock Exchange Notice.—Application has been made to allow the following to be quoted in the Official List:—

Fraser & Chalmers, Ltd.—£100,000 6 per cent. debentures of £100 each.

City of Buenos Aires Tramways (1904) Co., Ltd.—Dividend of 1s. 3d. per share, being at the rate of 5 per cent. per annum, less tax, for the three months ended September 30th.

Swedish Metallurgy.—According to statistics, the output of electric furnaces in 1915 was as follows:—

	Metric tons.
Iron	33,075
Ferro-silicon	11,819
Manganese ferro-silicon	2,328
Ferro-chrome	242
Ferro-manganese	957
Ferro-silicon-aluminium-manganese	785
Ferro-silicon-aluminium	346
Ferro-vanadium	4

The major part of this output is derived from the Trollhättan works. In this works the output of zinc from the electric furnace by direct treatment of the ore and scrap metal rose in 1915 to 8,588 tons, against 2,290 tons in 1914, an increase of about 273 per cent. There were in Sweden at the beginning of 1916 about ten electric furnaces ranging from 2,000 to 3,000 kW.—viz., at Domnarfvet, two furnaces of 3,000 H.P. and one of 6,000 H.P., all working; at Soderf, three furnaces of 3,000 H.P. under construction; at Ljusne, one furnace of 3,000 H.P. under construction; at Hagfors, three furnaces of 3,400 H.P. under construction; at Trollhättan, one furnace of 2,000 H.P. working and one of 3,000 H.P. under construction. Some of these furnaces were finished in 1916, and it is reckoned that the output of electric iron will greatly exceed that of 1915. Besides these furnaces, there is a large number of steel furnaces which treat either cast or scrap iron or else refine ordinary steel; their output at present is 100,000 tons yearly. According to observations and calculations made, a complete works fitted with three furnaces of 3,000 or 4,000 H.P. capacity would cost before the war about 400,000 fr. per furnace; the working requirements of each 3,000-H.P. furnace turning out 20 tons of iron per effective working day being, per ton:—

Anthracite coal	300 kg.
Electrodes	5 kg.
Lime	107 kg.
Electrical energy	2,116 kW.-hours
Labour	3 fr.

Such a furnace would require the services of 30 men for all purposes.—*Rivista Tecnica d'Elettricità.*

THE RHODES-FIRTH COMBINED LIGHTING AND ENGINE-STARTING SET.

AMONG those who are devoting attention to the question of dynamos for train and motor-car lighting purposes, and to combined generators and motors for use for engine starting as well as lighting on petrol motor vehicles, are Messrs. Jos. Firth, of Windsor Road, Werneth, Oldham, and Wm. F. W. Rhodes, of Bradford, from whom we have received some particulars of their joint productions, which embody some interesting details.

Dealing first with the car-lighting generator, this is of the shunt-wound, double-pole variety, the leading feature being the method of drive adopted to secure that the dynamo shall be run at a constant speed—when a pre-determined speed of the engine or vehicle has been attained—despite the ever-varying speed of the

undue heating of the generator, but prevents the drawing in of any dust or other impurities with the air, which passes through apertures in the generator casing and out at the opposite end of the machine to that at which it enters.

Reference may now be made to the means provided for automatically making and breaking the connection between the generator and the storage battery employed when the engine speed attains or falls below a predetermined rate. Pivotaly mounted on the exterior of the generator casing is an insulated lever, one end of which passes through the casing surrounding the friction pulley and governor. On this end of the lever is mounted an anti-friction bowl or roller, so that when the friction driving pulley is in a certain position on its supporting shaft the bowl or roller engages with a collar on the upper end of the truncated cone of the friction pulley. The lever is acted upon by a suitably-disposed flat spring, which tends to keep the lever end opposite to that above referred to away from the generator casing, the lever being thus at one time influenced by the movement of the truncated cone and at other times by the spring. The outer end of the lever is attached to a flat spring, which, in its turn, is connected with a cut-out

FIG. 1.—RHODES-FIRTH CAR-LIGHTING DYNAMO.

FIG. 2.—DYNAMO, AND CASING ENCLOSING FRICTION DRIVE.

engine or other part of the chassis from which the generator derives its power, and so enable the current generated to be delivered to the battery at a practically constant voltage. The system of drive adopted, both for the generator in its simple form, and in the combined dynamo-motor, is indicated by the sectional plan drawing fig. 3. From this it will be seen that, mounted on ball bearings in a casing at one end of the machine, is a spindle, the outer end of which projects through the casing and terminates in a bevel gear meshing with a bevel ring fitted to the engine flywheel or other rotating part of the chassis of the car, as shown in fig. 6. The inner end of the spindle, within the casing, is provided with a friction pulley, with which is combined a spring-controlled governor of the centrifugal type, so mounted as to rotate with the shaft, and to be able to slide along it as the speed of the shaft increases or decreases. In order to allow for the compact disposition of the governor in relation to the friction driving pulley, the latter

lever so situated as to be able to engage with, and disengage from a contact device of spring form, mounted on an insulated block and arranged in circuit with the battery. Thus, when the pre-determined speed of the engine—or in other words, the battery-charging voltage—has been attained, one end of the lever is raised and the other lowered, the circuit between the generator and the accumulators being thus automatically completed, and, *vice versa*, broken when the engine or vehicle speed falls below a certain rate. In order to secure a quick make-and-break action between the contacts, a suitable projection is provided to act in combination with the cut-out lever. The projection holds up the movement of the contact for a brief period, irrespective of the movement of the lever operating it, the resulting lag ensuring that the make or break, when it occurs, shall be practically instantaneous, any "arcing" or burning of the contacts when coming into or out of action being at the same time avoided. It may be added that the generator is provided with a disk commutator in combination with spring brushes, their form being such as to render more positive the contact between the driving and driven friction surfaces already mentioned.

As will be seen from the general views figs. 1 and 2, one of the features of the machine is its compactness, the 6-volt, 150-watt dynamo, including the casing containing the friction drive, measuring only 5 in. by 9 1/2 in., this being a point of importance in motor vehicles where it is extremely desirable that the installation of a lighting dynamo shall not interfere with the accessibility of any of the component parts of the engine or chassis. Another important factor is that of the weight, the machine illustrated, which is claimed to have a minimum overall efficiency of 67 per cent., being only 16 1/2 lb.

As already indicated, Messrs. Rhodes and Firth have also adapted their constant-speed friction drive to a combined dynamo-motor for engine-starting as well as lighting purposes on motor vehicles.

The double-purpose machine is driven as a generator in the manner already described; to enable it to be used as a starter, however, the machine spindle, in addition to carrying on its extremity a driven friction disk, is also provided with a small bevel pinion (C, fig. 4) which meshes with a bevel crown wheel, C 1, secured to the lower, wide end of the truncated cone which carries the friction driving band. In this way a positive drive is, for engine starting purposes secured, the gear ratio being 4 1/2 to 1. When used as a starter the centrifugal governor is automatically put out of action by a locking device—not shown in any of the accompanying drawings owing to the fact that the necessary patents are not yet issued—so that the truncated cone is held stationary, as to its position thereto, on its shaft. The locking device is arranged to remain in action until the engine has been set in operation and has attained

Friction pulley, B, B'; friction disk, D; fan vanes, D'; air inlets, P'; automatic contact mechanism, J, J'. K, M; commutator and brushes, E, E'.

FIG. 3.—SECTION PLAN OF RHODES-FIRTH CAR-LIGHTING DYNAMO.

is, as will be seen, made in the form of a truncated cone, provided at its larger end with a relatively narrow friction band which makes contact with a friction disk mounted on one end of the generator spindle. A feature of the governor spring is that it embodies provision to overcome the usual tendency of centrifugal governors to have a greater movement as the rate of revolution increases, thus adding to the uniformity of the generator speed, which in the case of the 1,500-watt train-lighting dynamo referred to further on, is claimed not to exceed 5 per cent. The friction disk on the generator spindle is made in the form of a fan that is, vanes or blades are provided on the back of the disk so that, when it is rotating, air is drawn in through holes, covered by pads, formed in the cover over the brush or commutator end of the machine, an arrangement which not only assists in preventing any

from $\frac{1}{4}$ th to $\frac{1}{3}$ rd of its maximum speed, when it automatically releases the governor, so allowing not only the disengagement of the bevel gear, but the friction drive of the dynamo to come into

FIG. 4.—ENGINE-STARTING DEVICE.

operation. When the engine is at any time stopped, the friction drive spindle, under the action of the governor, automatically lowers, so bringing the bevel gears into engagement ready for the

FIG. 5.—GENERATOR-MOTOR CONNECTIONS FOR ENGINE STARTING.

next start-up. The combined generator-motor is made to work at a pressure of 12 volts and has a capacity of 250 watts, the gross weight being 28 lb. The ratio of governor speed as a generator is

FIG. 6.—RHODES-FIRTH TRAIN-LIGHTING DYNAMO WITH DOUBLE FRICTION DISK.

33 to 1, while, when used as a motor or starter, the machine is claimed to be capable of giving a starting torque equal to $\frac{1}{3}$ B.H.P. The minimum efficiency as a generator is stated to be 72 per cent.,

and as a motor 76 per cent. A diagram of the connections when the machine is used as a starter is given in fig. 5.

For train-lighting purposes, the same method of drive as indicated in fig. 3, is adopted, the principal variation being the provision made to enable the dynamo to be driven in a constant direction whether the train is running either forwards or backwards. In this case, the extension of the generator spindle carries two friction-driven disks either of which may be automatically engaged by the friction driving band, according to the direction of running of the driving shaft, by reason of the "pull" exerted by the gear wheels forming the drive on a swivel joint which, as shown in fig. 6, is provided in conjunction with the friction driving band spindle. The train-lighting set has a capacity of 1,500 watts, the gross weight being 200 lb.; the ratio of governed speed is 10 to 1, the variation of speed of the generator spindle being, as already mentioned, claimed not to exceed 5 per cent., and the variation of pressure not more than 8 per cent.

GERMAN ECONOMIC ORGANISATION.

THE following important quotation from the *Board of Trade Journal* may to some extent explain the very emphatic advice which has recently been given by representatives of the Government Department of Commercial Intelligence with respect to the need for co-operation and combination amongst British manufacturers:—

"The *Neue Zürcher Zeitung* follows up its review of the progress made in industrial discoveries and processes in Germany during the war, with a review of the progress accomplished in the field of economic organisation in that country in the same period. The chief characteristic of the third year of war has, it is said, been the tendency towards compulsory and voluntary syndication of industrial concerns. Compulsory syndication has been demanded by the Government to secure economy in view of the scarcity of material and the shortage of labour; while voluntary syndication has been suggested and carried out by the parties interested, by way of preparation for the prospective economic war, and in order to facilitate the return of peace conditions in the economic sphere, though in some cases this action has been in response to suggestions and hints on the part of the Government. This was the case with the renewal of the coal syndicate, in which all mining firms hitherto remaining outside are now included. The sole reason for the smooth progress of the negotiations was the threat of compulsory syndication in the event of non-agreement.

"The great union in the chemical industry, on the other hand, has been voluntary. This combine, which is for a period of fifty years, is primarily of a defensive nature. The constituent works retain complete independence and freedom of action, but profits will be pooled, all manufacturing experiences exchanged, and all products produced in at least two places. This arrangement, it is hoped, will do much to further the exploitation of new discoveries and to promote technical progress, with the result that the position of the German chemical industry in the world market will be strengthened.

"Agreements with the same object have recently been made between the dyeing and explosives groups of industries. The same tendency is observable in the central combines of the German wholesale trade, the shipping trade, &c., which have arisen during the third year of the war, and also in the efforts now being made towards the further syndication of numerous small industries, e.g., the rope, leather, iron small wares, and enamel industries. The pooling tendencies do not, however, meet with approval everywhere. In the leather industry, for instance, there is keen opposition between the heavy branches, which are in favour of a trust, and the fine branches, which are against it.

"In the iron industry, syndication proceeds slowly but surely, and not without official support. Efforts are now being made to re-establish the rolled wire combine, which was dissolved soon after the outbreak of war. Altogether the syndicate idea has gained ground in the by-products industry much more quickly and distinctly than had been expected. But it is not probable that all the recently-formed syndicates will continue after the war, unless Government action is taken to ensure that they should continue, at any rate for the transition period, in the interests of national economy.

"In addition to the combines properly so-called, there have been numerous amalgamations and fusions of individual concerns, which are further evidence of the general tendency towards the development of large organisations in German economic life. Numerous individual men of business are retiring into private life, their places being taken, as a rule, by large companies and combines. This concentration has been further promoted by measures taken or proposed within the States, such as the proposal to tax turnover. Were such a proposal carried into effect, it would probably give a great advantage to the large enterprises which carry on the whole range of production from the raw material to the finished product, so that the turnover is not subject to frequent charges. Such measures have brought about a similar concentration in trade, as they have resulted in many liquidations of smaller firms.

"The role played by the banks in these fusions, amalgamations, and absorptions is much less important than in peace time: first, because the undertakings in question have as a rule made such large war profits that they can dispense with the assistance of banks; and, secondly, because the banks themselves are undergoing a process of concentration, which is, however, being carried on below the surface. The chief reason for this tendency towards concentration is that the problems confronting German finance on the conclusion

of peace (the problems connected with supplies of raw materials, resumption of issue, reconstruction of credit organisation, &c.) can be accomplished only by institutions of extraordinary capacity and internal strength. The result of this must perforce be a further reduction in the number of medium-sized houses."

LEGAL.

ABRAHAM C. ALLIED MANUFACTURERS' GUILD, LTD.

In the City of London Court, on November 1st, before his Honour Judge Atherley-Jones, K.C., Victor Abraham, Bayswater, sued the Allied Manufacturers' Guild, Ltd., 21, Coleman Street, E.C., for £81, for two weeks' salary at £4 a week, and damages for breach of agreement.

Mr. Clements appeared for the plaintiff, and Mr. Mayne, defendants' managing director, defended.

It seemed from the plaintiff's case that he was employed as defendants' manager at Moorgate Hall, at a salary of £4 per week, and he had to take up £100 worth of shares in the defendant company at the outset. The £100 was to be refunded if the company went into liquidation, and within 12 months when he left their service. Plaintiff declared that defendants wanted to alter the payment of his salary from weekly to monthly, and then they would not, or could not, pay him at all. That, he urged, put an end to his contract, and he demanded damages. Defendants denied that they had put an end to the contract. They never refused to pay him his money. The Guild was formed to develop trade in electrical goods between England and the allied and neutral countries, to stop dealing in German goods. They co-operated with manufacturers to that end. Plaintiff undertook that class of work, but, owing to import and export restrictions, the company could not get an income. Plaintiff's services were practically of no use to them. He agreed to take his salary monthly.

JUDGE ATHERLEY-JONES said plaintiff had no right to assume that he would not get his salary. There had been no breach by the defendants. Plaintiff would get the £8 paid into Court as wages, but no more. Judgment accordingly.

WAR ITEMS.

Cancelling German Contracts in Brazil.—A Reuter dispatch from Rio de Janeiro states that the Foreign Committee of the Chamber has authorised the Government to cancel all contracts entered into with Germans.

Ministry of Reconstruction.—The Minister of Reconstruction has appointed Mr. Vaughan Nash, C.V.O., C.B., and Mr. G. H. Young, C.B., to be joint secretaries to the Ministry of Reconstruction.

Russian Industrial Demobilisation.—The "Times" states that delegates representing mobilised industries of Russia have decided at a general meeting to begin the preparation for industrial demobilisation.

Unscreened Lights.—Vernon Lovegrove, electrician at the Cold Storage of the Port of London Authority in Charterhouse Street, E.C., was fined £10 at the Guildhall on Saturday for leaving unscreened lights on the top floor of the premises on October 24th.—*Times*.

Ball Bearings.—The Minister of Munitions has made an Order under the Defence of the Realm Regulations forbidding the manufacture after November 1st of ball bearings or roller bearings without a licence. He has also prohibited on the same conditions the sale of ball bearings in this country and the purchase of them outside the United Kingdom. Manufacturers may be called upon to make returns of their stocks. Applications for licences may be addressed to the Director of Ball Bearings, T.M.3, Ministry of Munitions, Whitehall Place, London, S.W. 1.—*Times*.

The F.B.I. and Italy.—Sir R. Vassar Smith, Bart., president of the Federation of British Industries, has sent the following telegram to Signor Orlando, the Premier of Italy:—

"The Federation of British Industries extends its full sympathy to the Italian Army and nation in the present crisis, and pledges its members, whose joint capital represents over 2,000 million sterling, and who employ some 3,000,000 work-people, to stand unreservedly behind the British and Allied Governments in furnishing to Italy any support which they may deem necessary."

Building Materials.—The Minister of Reconstruction has appointed a committee to consider and report upon the question of the supply of building materials after the war. They will collect information as to the probable demand for such materials and the availability of supplies, also how the latter may be increased, and the effect of such increase upon price, also the principles and methods by which the priority of various claims should be settled. They will report what steps are necessary to facilitate the prompt commencement of building work at the cessation of hostilities, and will make

recommendations as to any measure of control that may be necessary in regard to charges, production, transport, or distribution of material. The matter is in the hands of the Buildings Materials Supply Committee, Ministry of Reconstruction, 2, Queen Anne's Gate Buildings, London, S.W. 1.

French Electrical Anti-German Propaganda.—We have before us copies of an illustrated leaflet which is being distributed in Paris by the Ligue Nationale de Defense des Interets Francaise. Translated the circular reads in part as follows:—

"To you who used to buy apparatus, material, and electric fittings from German firms, Siemens & Halske Aktien Gesellschaft, Wernerwerk, Berlin-Nonnendamm (Preussen, Deutschland), and Siemens Schuckert, Gesellschaft mit beschränkter Haftung, Siemens-Stadt bei Berlin (Preussen, Deutschland) through their representatives in France, . . . be it known that these German firms show you their gratitude by manufacturing shells now for killing or mutilating daily French officers and soldiers, your sons, brothers, relations, and friends." An illustration is reproduced in the circular of a shell fuse picked up by "one of our gallant soldiers in Champagne." "The trade-mark 'S.I.' stands out most clearly, and it is the duty of every Frenchman henceforth to exclude this trade-mark rigorously from France."

"A.E.G., Société Française (.) d'Electricité, Société Anonyme. Représentation générale de la Allgemeine Elektrizitäts Gesellschaft, Dorotheen-Strasse, No. 40, Berlin, N.W. 7 (Preussen, Deutschland); Paris. Agencies at Caen, Lille, Lyons, Marseilles, Nancy, Nice, Toulouse. Board of Directors: President, Mr. Deutsch. Members, Messrs. P. Mannroth, Thurnaner, Burrell, Roos Koch. Managing director, Mr. Koch. Auditors, Messrs. Gnéronlt & Pfeffer."

An illustration is here reproduced of a shell fuse picked up at Avocourt, "on the battlefield before Verdun (May, 1916) by Lieut. Copen, Knight of the Legion of Honour, slain by the enemy in August, 1916. Notice how these three letters A.E.G., trade-mark of this German firm, stand out plainly on the fuse, clearly justifying the charge so often made that the only true 'industry' of Prussia and Germany is war. The least we owe to the memory of our fellow-countrymen who have fallen is to shut out from France for ever this detested trade-mark."

Exemption Applications.—The Military appealed against exemption to January 31st (or until a substitute was found) given by a Local Tribunal to L. W. Cornish, Exeter (21, single), B.I, acting shift engineer at Exeter Corporation electricity works. It was urged that three shift engineers, each working eight-hour shifts, were essential at the works. The Military Representative said he had made an offer to Mr. H. C. Munro, city electrical engineer, to consent to Cornish being given six months' exemption, with leave to apply again, provided Mr. Munro did not appeal for Benson, another engineer, a younger man in Class A. Mr. Munro agreed, and the Tribunal approved.

Application was made to the Fulham Tribunal for the exemption of an electrical and mechanical engineer, aged 32, married, employed by the British Vacuum Cleaner Co. It was stated that the man was engaged practically the whole of his time on Government work, and was responsible for the repair of all machinery. He was the only engineer left to the firm, and was more or less at the call of the Government. Subject to military training, four months' exemption was granted.

At Barnsley, the Electric Traction Co., Ltd., appealed for 15 employés, the whole of whom were conditionally exempted.

On the recommendation of the Advisory Committee, Rochdale Tribunal has granted temporary exemption until March 31st to J. T. Hoyle (34, B.I), controller cleaner and examiner, appealed for by the Corporation Tramways Committee.

With the assent of the Military, three months have been allowed to A. Deahl (40), electrician, and E. G. Durdle (40), dynamo attendant, engaged at Brookwood Asylum, Woking.

Kidderminster Tribunal has granted exemption until March 31st to E. Turner (37, Class A), car-shed foreman, and A. E. Jackson (37, B.I), motorman.

At Ilfracombe, the Tribunal adopted a recommendation by the Advisory Committee giving temporary exemption until April 1st to A. H. Friend (33, C.3), electrical engineer.

At Tunbridge Wells, an electrical engineer appealed for two electric light wiremen. The Military Representative said that there were nine men engaged in this work in the town, and that these two men previously held protection certificates. Mr. S. A. Cheale (a member of the Tribunal) suggested that lads of 17 could do many of the jobs, but the employer declared that lads could not do nine out of ten such jobs. One of the men was refused exemption, with grace until January 1st, and the other was exempted until a suitable substitute is found.

Epsom Rural Tribunal has granted three months' exemption to W. West, electrician, of Cobham.

Before the Cumberland Appeal Court, the Carlisle Tramway Co. appealed for the traffic inspector, H. Shrubsole (32, Class A), the only inspector left, and stated to be working from early morning to late at night. Most of the old drivers had gone, and it was represented that the staff needed a great deal more looking after than formerly. In reply to questions, it was stated that the company had no female drivers; the

Corporation would not licence them. The appeal was dismissed.

At Southwark, F. J. Leach, 22, an electrical sub-station attendant, was summoned at the instance of the Military Representative to show cause why his conditional exemption certificate should not be withdrawn. He did not attend, the Clerk stating that he had received exemption through the Metropolitan Railway Co. Coun. King said it was outrageous that exemption should be granted to a single man, who probably was fit for general service. The Clerk said the Tribunal had no power in a case like this, as an arrangement had been come to between the Government and the railway company. The conditional exemption certificate was withdrawn.

Messrs. Paice & Endicott, electrical engineers, of Southwark Bridge Road, applied for the exemption of a metal polisher, 3ft. fit for garrison duty abroad (B1), whose wages averaged £3 a week. He was engaged entirely on Government work, grinding and polishing spare parts for munition factories. They held certificates under the Protected Trades' Schedule for three men, but had not been granted one for this man. The Military Representative said the protected trades' certificate was the real test of the man's work. Was he essential to the firm's output? The firm's manager replied that he was. The Military Representative: Then why have you not pressed for a certificate? The manager replied that they had pressed for one, but they had received a letter from the Ministry of Munitions stating that they could not grant this man a certificate under the schedule until the claim for exemption was disposed of by the Tribunal. The Military Representative said on that letter the applicants had not lost their final application for a protection certificate. The Tribunal appeal must first be disposed of, for the Ministry of Munitions did not know on what grounds his exemption there was granted. He might have got it on domestic grounds, but now the claim must be dealt with under the schedule. A month's final exemption was granted, the firm being referred to the M.A.R.O. for further protection.

New Norwegian Carbon Factory.—A U.S. Consular report states that the A/S Norske Elektroleverker is erecting a new factory at Frederikstad for the manufacture of carbon and graphite electrodes. The plant's capacity is 4,000 tons of carbon or 1,000 tons of graphite electrodes a year. It is expected to be in full operation by the end of December, 1917.

The same general standards and sizes of graphite electrodes are to be manufactured as those used throughout the United States, while the carbon electrodes run in very large sizes; most of them are rectangular in section, after a European style, the most common size being $15\frac{1}{2} \times 7\frac{1}{2}$ in. Carbon electrodes will be the first product to be turned out. American engineers and machinery experts have been engaged to conduct the work of the factory, in which the machinery is to be almost exclusively of American manufacture.

The Norske Elektroleverker has contracted to supply the demands of several Norwegian firms for electrodes, all such contracts providing that the prices named therein shall be subject to change to conform with any rise in the market prices of raw materials. This clause in contracts is made necessary, it is explained, by reason of the vast advances in price to which almost any commodity is subject in Norway in these times. The standing orders which this company now has in hand are said to be sufficient to ensure the profitable disposal of the factory's output for some time, but it is believed that by February 1st, 1918, the management will be in a position to accept general orders from Norwegian firms for delivery within a reasonable time.

The factory is working in co-operation with the Norwegian Government, and the Royal Department of Industrial Supplies has promised to facilitate the provisioning of the company with sufficient raw material for the successful operation of the plant. The Government will have the first call on the company's finished product whenever electrodes are required for Governmental uses.

Permission to receive anthracite from the United States has been granted to this company by the British authorities, upon the usual assurances that its products are not to be disposed of to nations hostile to the cause of the Allies.

The Norske Elektroleverker has contracted to be regularly supplied with 1,500 h.p. by the Hafslund A/S, one of the three largest power companies of Norway, which derives its power from the Sarpsfall on the Glommen River. In anticipation of its present plant becoming inadequate and the necessity of erecting a branch factory, the Norske Elektroleverker has purchased the rights to the entire power to be derived from a waterfall on the west coast of Norway, near Kristiansund.

THE INSTITUTION OF ELECTRICAL ENGINEERS.

The Inaugural Address affords the one opportunity for the President of a great Association, such as the Institution of Electrical Engineers, to say what he thinks upon any subject whatever, with the comfortable assurance that no man can say his nay for it is not open to discussion. That Mr. Wordingham availed himself to the utmost of the opportunity will be admitted by all who were privileged to hear his address on Thursday last week, and we tender our respectful congratulations not only on the manner of its delivery, which testified to the physical energy of the speaker, but also on the matter of the address, crammed as it was with ideas, aspirations, suggestions, and exhortations all directed towards the advancement of the Institution and of the industry with which it is associated.

We must confess that the opening passages of the address cast a momentary gloom over our spirits; the President, whilst emphasising the importance of the functions of the Institution with regard to scientific progress, declared that it should not attempt to look after the commercial interests of any one of the sections of which it was composed, on the ground that it was impossible for it to do so efficiently. Yet in an earlier paragraph he said:—"The Institution and the industry should be one, and if they are not, it is our business to make them so." Our thoughts are irresistibly carried back to the spring of 1914, when the Industrial Committee, which had been framed to secure the widest representation of the industry, was deliberately smothered by the Council, which refused to confirm a *compromise*—not a conflict—between two important sections of the industry on the ground that the agreement included clauses relating to trade discounts, and that it was undignified to deal with money matters. Likewise, the Council declined to accept the Committee's proposal to set up a national testing institution (a proposal dear to the heart of Mr. Wordingham) on the ground that it had a "political" tendency.* How, in Heaven's name, can the Institution be identified with the industry if it adopts this "high-browed" attitude? The President cannot have it both ways.

Mr. Wordingham has made no secret of his opposition to the "broader policy" initiated by Dr. Ferranti; he is a clean fighter, as befits the Electrical Engineer to the Admiralty, and he set forth his views on this subject, as well as many other points that are dealt with in his address, in an article in our issue of May 29th, 1914. While we do not see eye to eye with him in this matter, we respect his views, well knowing that no one has worked harder for the Institution than he.

In order to solve the difficulty arising out of the heterogeneity of the components of the Institution, the President proposes that each of these groups

shall be organised after the manner of the I.M.E.A. and the B.E.A.M.A., Associations whose activities unquestionably have been of the greatest value to their constituents and to the industry in general, and that each group shall be directly represented upon the Council, in addition to members elected by the whole body of members of the Institution. This also is one of the proposals which he put forward in the article to which we have referred, and it raises an important question of principle. Every member of the Council is understood to act in the interests of the whole body of members, and not in the special interests of the section with which he happens to be more particularly associated. However, the proposal is distinctly interesting; whatever the theory, in practice an elected representative is often called upon to act on the immediate behalf of his electors, and if that were accepted as one of the duties of his office, it would appear desirable that steps should be taken to ensure the adequate representation of all the groups concerned.

We have often thought it a pity that the fine building of the Institution could not be utilised to greater advantage; as the President points out, its "load factor" is painfully low, and the restrictions imposed by the regulations which bind the Institution under the Companies' Acts at present constitute an insuperable obstacle to its more profitable utilisation. Undoubtedly there is a large number of electrical engineers who now foregather in the neighbourhood of Kingsway, and who, with others, would gladly make the Institution their rendezvous if it afforded them the necessary accommodation. We believe that there is here an immense opportunity for the Institution, once again in possession of its home, to formulate and carry out a bold scheme which would not only command the success which has attended the Manchester Engineers' Club, but would have even more far-reaching results. With the unique example of the Engineering Societies of New York before us, we still hope to see the Institutions of this country co-operating in the establishment of an Engineering Headquarters which shall become the centre and focus of the engineering activities of the Metropolis and of the Empire. And passing over many other useful and interesting suggestions, which will be found in the abstract of Mr. Wordingham's address elsewhere in this issue, this brings us to what we hope may prove to be the crowning achievement of his year of office—the conferment of a Royal Charter upon the Institution and its kindred societies. Could this be secured, many of the difficulties and disabilities which at present hamper the progress of engineering, and especially limit the usefulness of engineering societies, would at one stroke be removed; the status of the profession would be recognised, and its influence would be immensely increased; it would offer a career comparable to that of the other learned professions, to which it is at present only an unhonoured appendage; it would constitute a body representative of engineering, and entitled to speak and act in its name, and it would bring together into one fellowship the whole body of engineers, a feat that could be accomplished by no other means.

The Institution of Civil Engineers, we may point out, was incorporated by Royal Charter in 1828; judging by results, it would appear that the terms of its Charter were not so framed as to secure the foregoing benefits, but these could be amended.

While the whole address bristles with topics calling for comment, the exigencies of space have compelled us to confine our attention this week to but one-third of it, and we conclude our remarks for the moment with the suggestion that, so far as the Institution is concerned, the proposal that it should obtain a Royal Charter is by far the most important of the President's propositions, and should command the hearty support of every member.

SIR R. V. VASSAR SMITH, who is
The Future President of the Institute of
of Industry. Bankers (his election also as President of the Federation of British

Industries is already known to our readers), delivered his inaugural address on November 7th. The speaker did not attempt anything in the nature of an original discourse. He limited his address to a plain summary of the outstanding facts of the industrial situation. Most of the points here brought together have been urged repeatedly in our pages during the past three and a half years, and some of them were stated here with emphasis many years before the war. In those days they often seemed to fall upon deaf ears. To-day we are pretty well agreed as to what ought to be done. Let us hope that in many directions we may be able to carry conviction on to practical achievement. Sir Richard sees no reason for dejection or discouragement in regard to after-the-war conditions. We shall have to carry a heavy financial burden, and the work of reconstruction will be long and arduous, but we shall build on firmer and fairer foundations than formerly. The President agreed that it was impossible to go back to pre-war conditions, but we had to face the work of rebuilding without suspicion, distrust, or mutual hostility, and must remove, as far as possible, all friction from the machinery of progress. In addition to our financial burden, there would be the cost of repairing the wastage caused by the war, an enormous amount that must be made good, and money must be found to provide the means for increased industrial production. Only with greater industry and production could we meet our difficulties. The first and most serious question was the relations of Capital and Labour. Only by harmonious working between these two forces could the required result be obtained. British trade was capable of vast expansion, and by that means they would have a better remuneration of labour affording a higher standard of living, shorter hours, better housing, and a share of the profits after giving a proper return on capital, and providing reserves for depreciation and betterment. High wages were not necessarily a handicap; low-paid labour was not necessarily economical. Labour must be economised with the loyal co-operation of the working man. Some English employers had reduced their working hours with beneficial results. Reasonable holidays with pay should be allowed to the manual worker as to the clerical. Conferences which had been held to bring about better relations between employers and employed impressed him favourably, and he believed good results would follow. Production without extended markets would not be sufficient. In addition to being in a better position to supply Home demands, they would have to seek wider fields in the Empire and in foreign countries. We had suffered in the past from want of British representation. The necessity for large scale industrial organisation would remain after the war, indeed it would be irresistible, but he hoped and believed that the necessity for State control was only temporary. The day of small industries on individual lines was past, and our manufacturers and traders must organise for united effort, or many of the obstacles would not be overcome. Organisation meant increased stability, and a stable industry could weather storms which would wreck the small producer. The financing of industry would be immensely facilitated by organisation. An unstable, unorganised industry was the despair of bankers. Financial assistance might be required, Overseas trade generally demanded long credit and longer term advances than deposit bankers usually gave. New ideas must be investigated and developed, and that often required money, patience, and experiment.

TELEGRAPHY AND TELEPHONY AT THE FRENCH FRONT.

THE maintenance of continuous communication between General Headquarters and every part of the fighting front is one of the most important factors of success in the kind of warfare which has been evolved during the long struggle

(June 1st) illustrated a number of signalling stations in this part of the French system of communications—in and near the trenches—and we are now able to reproduce some French official photographs showing the arrangements in vogue further back, but still beyond the limits of the permanent lines of the telegraph and telephone administration. It will be seen that portability is an essential element in the constitution of these stations, but the apparatus and

[French Official.]

FIG. 1.—A CENTRAL TELEGRAPH STATION.

in France and Flanders. The forward course of traffic is from G.H.Q. to the Headquarters of the various Army Corps, thence to the respective divisions, brigades, and finally the trenches. In the rear are the main lines of communication between G.H.Q. and the high command, London, and Paris, as well as the hospital bases, store depôts, &c.

[French Official.]

FIG. 3.—PORTABLE TELEPHONE SWITCHBOARD IN CABIN.

methods employed approximate more closely to those used by the civil service.

Fig. 1 is an exterior view of a "Central d'Armée," consisting of cabins which are provided with wheels, but are, for the time being, mounted on trestles and furnished with convenient staircases. A terminal pole, from which telegraph and telephone wires will radiate to other offices, is approaching completion, and the indications are that this station is not likely to be moved for a fairly long period. The same impression is given by fig. 2, which represents the interior of the dynamo room, a shed roofed with corrugated iron and equipped with four petrol engines driving small dynamos for charging accumulators, lighting the offices, &c.

Fig. 3 shows the interior of one of the cabins, fitted with a magneto-calling telephone switchboard, constructed in portable sections, which can be closed for transport; the services of two men are required, indicating that there is a considerable amount of traffic through this office.

In fig. 4, another interior, there is further evidence of proximity to—or, at least, connection with—civilisation, in the shape of two Hughes printing telegraphs, in addition to telephone apparatus; and in fig. 5, the interior of a "Central de Cap d'Armée," are two telephone switchboards and a Morse recording telegraph instrument.

Since the arrival of the American contingent at the Front, says *Telephony*, the United States Army Signal Corps has completed an entirely independent system of communication lines connecting General Pershing's headquarters with all parts of his command and adjoining

[French Official.]

FIG. 2.—DYNAMO ROOM.

As the network approaches the firing line, the methods and apparatus adopted assume simplified and specialised forms, more portable and more readily rigged up and repaired than in districts more remote from the zone of conflict, and finally arrive at the telephone and buzzer sets which represent the limit of handiness and simplicity. We recently

villages. Everything except the poles was brought from America. Admirable portable telephone switchboards have been devised and supplied at the shortest notice by the U.S. manufacturers. It is interesting to note, too, from the

French Official.

FIG. 4.—HUGHES PRINTERS IN CABIN.

Telegraph and Telephone Age, that the Paris authorities have modified the rule which was laid down at the beginning of the war restricting telephone conversations to the French language: English is now permitted.

THE FUTURE OF THE ELECTRICAL INDUSTRY.

By A. O. HOLT.

Much has been written and said during the past few months concerning a subject of great national importance, viz., "Our Educational System." Mr. Fisher, the Minister for Education, deserves the thanks of the nation for the able manner in which he has reviewed and dealt with the system as a whole, and, undoubtedly, a new era has dawned for the teaching profession. Chief amongst the findings was the fact that teachers were most badly paid, so much so, that many who had a natural gift for training our children were ignoring that gift, and turning their attentions to more remunerative professions. More over, it has been noted that in the past there has been an entire absence of sympathy between various sections of those responsible for the training of the youthful minds of the country. Our great Universities have shown little or no interest in the Public Schools. The Public Schools have never been in real touch with our large Grammar Schools, while they, in turn, have regarded the Primary Schools as the medium merely for turning their own particular grade of youth out upon the world. In short, none of the sections have felt that they had anything in common.

These defects are, in the near future, to be remedied. There is to be a better and more sympathetic understanding between the various grades of the teaching profession, and a large Government grant has

been made for the purpose of increasing salaries, as an inducement to those best qualified for this important work.

Now, the writer is of the opinion that while the foregoing does not concern engineers, it forms an excellent parallel for the electrical industry, and many serious defects might be discovered by a close study of our engineering methods by those engaged in this important science.

With as much has been written and said about our trade after the war, we must be prepared to hold our own against other countries, particularly our enemies, in the struggle for electrical markets. We are engaged in a vast linking-up scheme, whereby we can economise our coal consumption so as to work at a high efficiency, and, generally speaking, we tell ourselves we must be in the van, both technically and commercially, in all matters concerning the electrical future. What are the facts to-day? What is the canker that is gnawing at the roots of our business in just the same way that it was in the teaching profession? Economy in salaries—that is the canker. Our leading engineers have been making precisely the same mistake as the education authorities did.

The writer was, some few weeks ago, invited to the house of a gentleman of what might be termed higher middle-class standing. The morning was spent discussing the best methods of entering the electrical industry as a career for his son, a promising youth just leaving school. The matter was thoroughly discussed, and it was pointed out that much hard work and study would have to be put in to rise to anything more than a mediocre position. Salaries were also mentioned and prospects of advancement, and there for a time the matter ended. Some weeks later the writer found that the youth in question had gone into an entirely different line of business, the explanation being that the chances of a decent salary and reasonable advancement were so remote for the work to be put in that it had been decided the youth could not hope to attain to, or keep, the social standing he had been used to for many years to come.

Inadequate salaries!—there it is. Many excellent youths, brainy, and with a predilection for the profession, are kept from engineering because the average father cannot find anyone of his acquaintance in the engineering line who is receiving a salary anything like in keeping with that of an ordinary middle-class business man. It would be interesting to know what proportion of electrical men under 40 years of age are getting over £250 per annum. The writer has seen engineers of considerable ability resign the positions they held and leave the profession

French Official.

FIG. 5. TELEPHONE SWITCHBOARDS AND MORSE INKER IN CABIN.

entirely to take up more remunerative posts in businesses in which the engineering part was but a side issue.

Engineers will stick it, for pride of profession, up to a

point, but, unless their hopes are fulfilled, and they get a salary in keeping with that of the average business man, they will not hesitate to take their leave of engineering, and will advise our youths to fight shy of it also.

Now, in taking a general survey, what do we find? Our leading engineers, both in control of manufacturing works and of large power supply undertakings, are out to economise first, last, and all the time, and this economy usually takes the form of small salaries. They are making the same mistake as the Board of Education did—starving the profession—choking off, as it were, the would-be engineers of the future by the treatment of the staffs under them. It is a lamentable fact that so soon as an engineer assumes control, either of a works or a large supply system, his whole pride as an engineer is invariably sunk in the piling up of dividends or relieving of rates, chiefly at the expense of his fellow engineers, who are treading exactly the same paths that he trod. Our engineers become more or less successful managers, and, unfortunately, cease to appreciate the valuable work carried on by their staffs, as proved by the miserable salaries doled out. Let engineers in command note that in sacrificing their profession and their fellow engineers they are not only doing a disservice to the electrical industry of the country, but are diverting many of the best brains of the youthful element into more remunerative channels.

And the staffs, that long-suffering body of men who have proved their patriotism over and over again during the past three years, what have they in common with their chiefs? Nothing. They have learned, reluctantly and with bitterness, the lesson that Governments only treat with collective organisations, and that the chief engineers, to whom they looked in their loyalty for some assistance, have literally left them to starve. Staffs are now organising, and are resolved to have a say in the scheme of things. The spirit of organisation is in the air, and is permeating the tissues of the most conservative amongst us: but to what end? The consolidation of our forces so as to be in the front rank of engineering matters after the war?—far from it. Rather to force chief engineers to give them a living wage, and one that they need not be ashamed of owning up to. The average staff engineer is being irritated beyond endurance in finding himself barely better off, and in many cases worse off, than the man with no technical ability, while his position will not bear comparison with that of an ordinary business man.

What is needed just now is an engineer to play the rôle of Mr. Fisher, in the electrical world—someone to review the industry as a whole, who can put his finger on the weak spots, see that the "economy" idea—especially in salaries—is not carried too far, and, with an eye to the future, map out a course in which our leading engineers, staffs, workmen, and embryo engineers can co-operate, so as to steer the electrical industry towards a better, more peaceful, and more sympathetic understanding during the commercial war that will inevitably follow with the introduction of peace conditions.

A LONG-DISTANCE DUPLEX-WORKING CENTRAL-BATTERY SYSTEM.

By R. L. MILBURN.

In this system the apparatus at the home station consists of a double-current key with 9 terminals, 3 top, 3 bottom, and 3 movable, a polarised G.P.O. 200-ohm relay, a rheostat with condensers up to 30 microfarads, and a sounder and local battery. At the out station (fig. 1) the apparatus consists of a key, Vyle sounder, and rheostat without any condensers. Three relays joined in series locally were used in place of the key, as shown in fig. 2.

Mode of Balancing.—The out station depresses his key, cutting off his rheostat, and measures the current, say 39 milliamperes; he then releases his key, and adjusts his rheostat until he measures $\frac{1}{3}$ of 39, or 13 milliamperes; 26

milliamperes is then measured in the rheostat branch after adjusting the rheostat.

Both stations now start balancing, the home station increasing capacity till signals are perfect. The Mandalay-Rangoon circuit, 386 miles of iron wire, required 21 microfarads to balance the capacity of the line.

When Wheatstone and Bandot were both working, 39 milliamperes were found to give perfectly satisfactory results. Both relays were adjusted neutrally.

The currents utilised for working duplex with Rangoon were:—

1. 7 and 21 milliamperes with 100 volts.
2. 10 and 30 140 ..
3. 13 and 39 160 ..

The currents can be traced as follows:—

1. Neither station sending—Mandalay line coil has 13 milliamperes negative current passing from K to L, and 26 milliamperes negative current passing from K to W through rheostat, giving 13 milliamperes negative current passing in the non-working direction of Mandalay relay

FIG. 1.

at the same time that 13 milliamperes negative current passes on to Rangoon through his relay from L to W to rheostat and earth: being in the non-working direction, at both stations the relay tongues remain at spacing.

2. Mandalay sending—Mandalay line coil has 13 milliamperes positive current passing from K to W, and 26 milliamperes positive current passing from K to L, giving a preponderance of 13 milliamperes positive current passing from K to L in the non-working direction, hence Mandalay relay remains at spacing, but 13 milliamperes positive current passes through Rangoon relay from L to W, producing a mark at that station.

3. Rangoon sending—Mandalay line coil gets 39 milliamperes negative current passing from K to L, and 26 milliamperes negative current passing from K to W, 39—26

FIG. 2.

giving 13 milliamperes in working direction, and causing a mark at Mandalay, but 39 milliamperes negative current passes through Rangoon relay from L to K in the non-working direction, causing the Rangoon relay tongue to remain at spacing.

4. Mandalay and Rangoon both sending—Mandalay line coil gets 39 milliamperes positive current, passing from K to W, and 26 milliamperes positive current passing from K to L, 39—26, giving 13 milliamperes passing in the working direction at Mandalay, and 39 milliamperes positive current passing from L to K in working direction at Rangoon, hence both station relays will mark.

The system has been worked successfully between Rangoon and Mandalay, a distance of 386 miles, and there is reason to believe that it could be worked up to 600 miles.

OFFICE ORGANISATION IN MUNICIPAL ELECTRICITY UNDERTAKINGS.

By G. W. STUBBINGS.

THE subject matter of this article, which some two or three years ago received a good deal of attention, has lately been little heard of. As there is reason to believe that the separation of the financial management of municipal electrical undertakings from the electrical engineer's department is by no means obsolete, it may be useful to say a few words on this matter with a view to pointing out the peculiar disadvantages of such a system.

The system in question may be briefly described as one in which the control of all money matters in connection with a municipal electricity undertaking is vested in the department of the borough accountant, and is quite removed from the jurisdiction of the engineer and manager. The theoretical reason for this procedure is presumably based upon the idea that finance is a matter as important in its way as the generation and distribution of electricity, and should therefore be controlled by an official and staff specially trained in such work. Obviously, such a principle applied with sufficient strictness would remove from the control of the engineer and manager the whole of the clerical staff. This extreme course is not adopted, but a line seems to be drawn so that all matters involving the paying or receiving of money are managed by the accountant's department. Even this rule has to be relaxed slightly in some small instances—for example, in the case of small cash sales at the works or the showroom when money is received. It therefore appears that the system, so far from resting on any very logical or well-defined principle, is rather the outcome of sentiment or prejudice. It results in such a curious state of affairs as the business of one concern being carried out in two separate offices, which may be a mile distant from each other; or of a clerk in the electricity works office who deals with meter readings, having his time occupied, not in making out consumers' accounts, but in copying the meter readings into books, which are duly taken to the office of the borough accountant in order that another clerk may copy them into another book, and, finally, make out the consumer's demand note.

The real reason for such a state of affairs, inefficient and inconvenient as it undoubtedly is, seems to be found in a misunderstanding of the legitimate functions of the borough accountant's department. Whatever work such department may carry out, or whatever control it may exercise in connection with the smaller non-trading departments of a Borough Council, it seems clear that the accountant and his staff should function, with respect to the electricity undertaking, as auditors only.

A small shopkeeper will, if he is wise, take care to have his books made up periodically by a competent book-keeper; but a large firm will keep a staff sufficiently trained to do this work, and will not call in outside assistance to make out customers' accounts. The auditing of the books by qualified accountants is, of course, compulsory in the case of a limited liability company, and it is, perhaps, the legal status thus given to accountants which makes them inclined, in the opinion of many impartial onlookers, occasionally to over-estimate the scope of their responsibilities and importance.

The advantages of having the whole of the business side of an electricity undertaking under the direct control of the electrical engineer and manager are obvious and manifold. A larger salary can be paid to the chief clerk, who can then be a man having a good training in accountancy. Overlapping of the work will be entirely eliminated; and in cases where the offices of the electricity department and the borough accountant are some distance apart, a host of correspondence will be saved which otherwise would be necessary, due to the many queries which would inevitably crop up owing to the abrupt break in the routine of the work. The steps in the sequence, from reading the consumer's meter to receiving the money in settlement of his account are easy and gradual; but if the routine be interrupted in the middle of its course and transferred to other hands, friction is almost bound to occur.

A further advantage in the system of single control arises from the fact that a great number of consumers' complaints are received at the time of paying their bills. This is, perhaps, not unnatural—and frequently these complaints are of a most trivial nature. If they are received by the accountant's department they have all to be noted, and communicated by letter to the electrical engineer, when, as it is then sometimes impossible to decide the importance of any particular complaint, great waste of time can be occasioned by following up such as are only trivial. If these complaints were received at the office of the electricity department, the majority of them could be dealt with there and then, an immense amount of time thereby being saved.

It is, of course, understood that the borough accountant will be vested with the authority of an auditor with respect to the financial matters of an electricity undertaking. This is, however, quite a different matter from the normal routine work being carried out by his staff, and in his office. Matters concerning the capital of the undertaking and the raising of loans will also, naturally, be the accountant's concern. It seems, however, that there is a very clear case for the routine work of rendering consumers' accounts, and the collecting of the same, being undertaken by the clerical staff of the electricity department. The disadvantages and clumsiness of the older system are manifest, and it is greatly to be deplored that prejudice and conservatism so frequently stand in the way of the inauguration of a simpler, smoother, and more efficient system.

AUTOMATIC CONTROL OF BLAST PRESSURE FOR DIESEL ENGINES.

By HERBERT S. RUSSELL, B.Sc., M.I.E.E.

(Abstract of paper read before the DIESEL ENGINE USERS' ASSOCIATION.)

THE working of a Diesel engine is substantially improved if the pressure of the air which blows the fuel into the cylinders is regulated according to the quantity of fuel to be blown in, or, in other words, according to the load on the engine, as the quantity of fuel used varies with the load. The present practice is for the regulation of the blast pressure to be effected by hand, but the objection to this is that, with variable loads, it demands constant attention from the man looking after the engine.

Automatic devices to effect this control have been tried in the past, without practical success. In the electrical air regulating device which has been developed by Messrs. Mirrelees, Bickerton & Day, the difficulties have been overcome, and the air pressure can be varied according to the load, irrespective of the efficiency of the air compressor, and without loss of compressed air.

Fig. 1 is a diagram of connections. The main current is passed round the solenoid A and controls the finger B, which is arranged to move round the scale of a pressure gauge, and is calibrated to point to that blast pressure which is best for the engine for the amount of power being generated at the moment, its "zero" or "no load" position being the no-load blast pressure. The pressure gauge is connected to the blast pipe; consequently its finger C points to the pressure in that pipe at any time. Both fingers are provided with platinum contact pieces D, E, and are insulated one from the other. The fingers B and C act therefore as a single-pole switch and make and break a relay circuit, which in its turn makes and breaks the circuit which operates the throttle valve F on the air-compressor inlet. The normal position of the throttle valve is closed, and it is held in that position by a spring G.

Supposing now that the engine is at work and the pressure in the blast pipe is lower than that indicated by the finger B, as being the proper pressure for the load, the fingers would be apart, and no current would pass through the relay coil H, so that the core J would make contact with the carbons K. This would complete the compressor throttle valve circuit, and the current would then pass through the solenoid L and pull the core (which terminates in the throttle valve F) downwards, and so cause the throttle valve to be held wide open, as illustrated on the diagram of connections. The pressure in the blast pipe would then rise rapidly (the compressors always have a substantial margin of capacity), so causing the gauge finger C to move up to and make contact with finger B. This would complete the relay circuit and cause a current to flow through the relay coil H and pull up the core J, thus breaking contact with the carbons K and breaking the compressor throttle circuit. The throttle valve F would immediately close under the action of the spring G, and it would remain so until the fingers came apart again. The slightest variation in the blast pressure or the load will operate the

relay, thereby opening or closing the throttle valve, as the case may be. When on a dead steady load the relay is continually in operation, and no variation in the blast pressure is visible. A variation of from 550 lb. ("no-load" blast pressure) to 950 lb. ("full-load" blast pressure) can be obtained in four seconds. As the fly-wheel takes several seconds to slow down in speed so that more fuel can be admitted by the governor, the correct pressure is always on the top of the fuel.

Fig. 2 shows the arrangement of the air inlet control valve for the compressor. This is divided into two parts, the top portion containing the valve and the bottom portion the solenoid. In the valve easing A, which is made of cast iron, a gun-metal liner B is fitted, having a series of holes in its periphery. In this liner the piston valve C is situated. This piston has a series of holes in its periphery which come opposite the holes in the liner when the valve is open. A groove is turned on the inside of the liner B in line with each row of holes, and similar grooves on the outside of the piston, so that the air has a free passage through the holes even if the piston is turned so that the holes do not coincide. The piston is fixed to a central spindle D, the bottom part of which forms the core for the solenoid. The valve is normally held closed by the spring E.

When current passes through the coil F situated in the bottom or coil casing G, the pressure exerted by the spring E

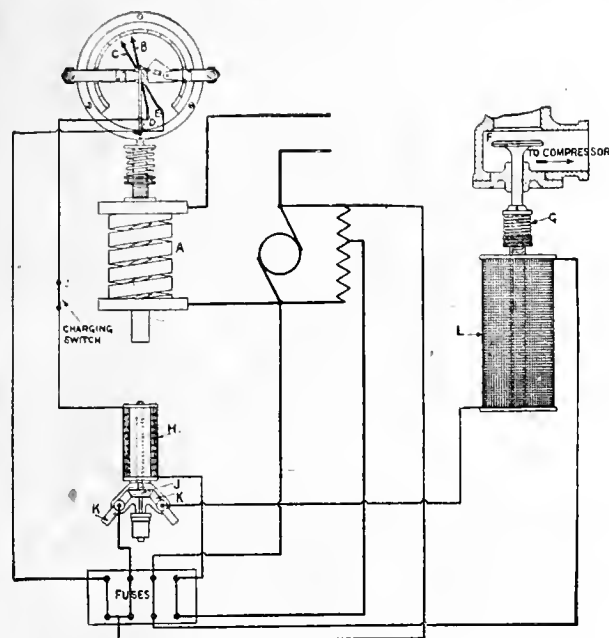

FIG. 1.—DIAGRAM OF CONNECTIONS OF ELECTRICAL BLAST CONTROLLER.

is overcome and the valve opened. The requisite opening is governed by the top adjusting nuts H, or, rather, the minimum opening required for "no-load" blast.

When the valve is opened air is drawn into the valve (due to the suction of the air-compressor piston) through the openings K and L into the interior of the valve, then through the holes in the piston and liner into the annular space M round the valve, and thus into the compressor. Holes N in the bottom of the piston are provided for the purpose of balancing the piston when in operation, so as to ensure free action, which would otherwise be impeded by the cushion of air below the piston. The air which passes through the annular opening L enters the piston through the holes N *via* the holes O drilled in the spigot of the coil casing G.

The coil itself F is made in two sections, and wound in such a way that both the terminals come to the centre of the coil, and, furthermore, are brought from the outside of the coil into the terminal block P. In the event of one of these terminal wires breaking, to obtain a new end all that is required is to unwind sufficient from the outside of the coil for this purpose.

The apparatus is made in three forms, a switchboard type, a pillar type, and a bulkhead type. The pillar type, as shown in fig. 3, consists of three sections, the top case A, intermediate box B, and pillar C. In the top case the control gauge D, main-current solenoid E, relay coil F, and fuses G are situated, mounted on mica covered rods H, which are secured to vertical bars fixed to the casing A. The front of the case is covered by a door secured by eye bolts and thumb nuts, two of which act as hinges. The main cables are led up the pillar C, and are fixed to the terminal block J, and the ends of terminal bars K, held by the top and bottom coil supports L. The case is insulated from the terminal bars by the ferrules M, and from the smaller wires by ferrules N. A large door O is fitted to the intermediate box B for easy access to the cable connections.

When the apparatus is used in connection with alternating currents the main solenoid is comparatively light, and the intermediate box B is used to house a transformer.

The apparatus is connected across the generator terminals so that it is always in operation and independent of the main switchgear; the power required to operate it is 50 watts.

A switch is mounted on the gauge board, and is so connected that when open it breaks the relay circuit, thereby causing the air inlet valve to be held full open when it is desired to charge the starting receivers.

Where this automatic blast control apparatus is fitted to Diesel engines very important advantages are obtained, among which the following may be particularly mentioned: Smoother running; saving of fuel on variable loads, as the control reduces the power absorbed by the compressors, and com-

FIG. 2.—ARRANGEMENT OF AIR INLET VALVE.

FIG. 3.—CONTROL GEAR: PILLAR TYPE.

plete combustion is more uniformly obtained; less attendance; less attention to exhaust valves, due to the complete combustion of the fuel at all loads, which ensures a clean exhaust; blast bottle dispensed with, a small separator being inserted in the pipe between the H.P. delivery from the intercooler and the blast distributor on the engine; parallel running of alternators facilitated; at sea an engine, as in the case of plants supplying current for lighting and wireless telegraphy, may be run after the engine-room has been abandoned.

Although this apparatus has so far only been fitted to Mirlees-Diesel engines, it is applicable to all makes of Diesel engines.

WAR ITEMS.

Lord Balfour's Committee.—Lord Balfour of Burleigh's Committee on Commercial and Industrial Policy After the War held a further sitting last week.

An Undertaking Repudiated?—In the "Times" for November 10th there appears a letter from Sergeant W. M. Ronaldson which certainly calls for reply from the Falkirk and District Tramways Co. From the statement itself, and from a letter from the company that is published along with it, it appears that Sergeant Ronaldson left the company in August, 1915, to join the Colours, and it was understood that his position as traffic superintendent was to be kept open. The directors under date October 3rd have written to him stating that as no one really anticipated that the war would continue so long, and as there are no signs of it coming to an end, they cannot keep the position open any longer, and will have to make a permanent appointment. As the *Times* points out, any general repudiation of this kind would undermine the whole feeling of security in which a large part of the Army went to war.

Trading with the Enemy.—The "London Gazette" for November 9th contains names of additional firms in the following countries with whom trading is prohibited:—Argentina, Paraguay and Uruguay, Bolivia, Brazil, Central America, Chile, Colombia, Netherlands, Netherlands East Indies, Norway, Peru, Spain, Sweden, and Venezuela.

Electrical Workers' Bonus.—With reference to the Skilled Time Workers' Wages Order, and the Ministry of Munitions explanatory circular M.M. 165, dated October, 1917 (see ELEC. REV., October 26th, p. 394, and November 2nd, p. 419), the Ministry has now issued a further circular specifying the occupations of scientific instrument maker (metal), and electrical fitter, as among those entitled to the bonus of 12½ per cent. if the men satisfy all the conditions of the Order. Skilled men in all the occupations that have been mentioned are covered by the Order, whether working in ferrous or non-ferrous metals. Only those skilled men in these occupations who are paid at or above the current district time-rate for turners and fitters are covered by the Order.

Works War Savings Association.—The Faraday Works War Savings Association, formed among the staff and employes of Messrs. Gent & Co., Ltd., Leicester, held their first annual meeting on November 8th. The secretary's report of the year's work showed that there were 140 members on the books out of 200 employes. Cash collected amounted to £750, making a total of 980 certificates purchased. The Association commenced with a membership of 60, which has been steadily increasing, thus showing that the idea, as elsewhere, has "caught on." Interest was stimulated as a result of the meeting, and 10 new members joined on the following Saturday.

Silvertown Employes' War Funds.—The Silvertown Co.'s Employes' War Relief Fund now totals £1,800. Each £100 collected is distributed as follows: £75 to the British Red Cross Society, £15 to the Serbian Relief Fund, £10 to the Anglo-Russian Hospital (Petrograd). In March last a War Savings Association (for the purchase of certificates by weekly contributions) was started by the India-Rubber Co.'s employes, and has been very successful. There are now 1,020 members.

Subscriptions to the German War Loan.—The following subscriptions, among others, are reported to have been made to the seventh German War Loan:—

A.E.G., Berlin	£500,000
Dynamo Brush Special Works, P. Ringsdorf, Mehlem	8,700
F. C. Guillaume, Cologne	150,000
Theodor V. Guillaume, Cologne	125,000
Pelten & Guillaume, Carlswerk	200,000
Emag, Electrical Measuring Instruments, Apparatus, and Switchboards Co., Frankfurt-on-Main	7,500
Hedderheim Copper Works & South German Cable Works	100,000
Continental Caoutchouc & Gutta-Percha Co.	375,000
L. Schwartzkopf, Berlin	250,000
Saxony Light & Power Works	175,000
Vollhorn Rope & Cable Works	50,000
Electrotechnical Works (late Stroecker & Co.), Offenbach	5,000
Rheinfelden Power Works	12,500
Electrotechnical Works, Offenbach, A.M. (late Schroder & Co.)	100,000
Max Schorch & Co., Rheidt	750,000
Siemens-Schuckert Circles, Nuremberg	75,000
Cassirer & Co. (Cable Works), Berlin	10,000
Richter Electricity Co. (Wol & Co.), Frankfurt-on-Main	10,000
Siegerland Electricity Works	75,000
Rheidt Cable Works	100,000
Electricity Co. (late Lahmeyer & Co.)	10,000
Lech Electricity Works, Augsburg	15,000
Telephone Apparatus Works, E. Zwietsch & Co., Charlottenburg	10,000
Lower Silesian Electricity & Tramway Co.	50,000
Voigt & Haeflner	10,000
Saxony Tramway Co., Plauen	75,000
Ludwig Sudicatis & Co., Berlin (Berlin Telephone Works Group)	25,000
Telephone & Telegraph Construction Co., Frankfurt-on-Main	100,000
C. Lorenz & Co., Berlin	15,000
Eupen Cable & Rubber Works Co., Eupen	15,000
Insulated Wire Works Co. (late Vogeli), Berlin	200,000
Deutsche Incandescent Gas (Auer) Co., Berlin	15,000
Telephone Apparatus, Cable & Wire Works Co., Nuremberg	7,500
Purchasing Association for Electrical Requirements, Frankfurt-on-Main	7,500
Accumulator Works Co., Berlin and Hagen	125,000
Land & So. Cable Works Co., Cologne-Nippes	25,000
Hartmann & Braun, Frankfurt-on-Main	50,000
Hermann Gradenwitz's Electric Motor Works, Berlin	7,500
Kempen-Rhein Electrotechnical Works	7,500
Hartmann & Braun (Officials and Workmen of), Frankfurt	5,900

Foremen and Draughtsmen and the War Bonus.—The following letter, received by the London Association of Foremen Engineers, speaks for itself:—

"Ministry of Munitions of War,

6, Whitehall Gardens, London, S.W. 1.
November 12th, 1917.

"Sir,—I have to refer to the interview with you on November 9th and previous interviews with regard to the remuneration of foremen in controlled establishments.

"In reply, I have to state that the Minister has no power, under the Munitions of War Acts, 1915 and 1917, to make any award applicable to persons in receipt of an up-standing salary, and it is contemplated that, in the first instance, employes should negotiate with their employers in the ordinary way, and endeavour to arrive at an agreement, which should then be submitted to the Minister for consideration. In the event of deadlock or failure, it is open to either party to refer the matter to the Ministry of Labour (Chief Industrial

Commissioner's Department) as a difference under Part I of the Munitions of War Act, 1915.

"With regard to the 12½ per cent. bonus which has been awarded to time-workers under the Skilled Workers' Time (Engineers and Moulders) Wages Order, 1917, I have to state that this Department would be prepared to consider an advance to the foremen and draughtsmen in receipt of emoluments not exceeding £250 per annum, provided that they are not in receipt of a bonus on output, and proposals which have been agreed between employers and employes with regard to this should be similarly submitted to the Minister for his consideration.—I am, Sir, your obedient servant,

(Signed) EDGAR DAVIS.

"J. HARRINGTON, Esq.,

London Association of Foremen Engineers,
85, Salisbury Road, Harrow."

Exemption Applications.—The Fulham Board of Guardians applied to the Local Tribunal for the renewed exemption of an engine-driver and electrician, aged 27, married. It was stated that the man was responsible for the maintenance of the electric plant at the workhouse, which is now being used as a military hospital. The Tribunal granted four months' exemption.

At the Cromer Tribunal, Messrs. Edmundson's applied for a mains foreman and general assistant, employed at the electricity works, aged 35, married, and classed A. He has been engaged in a similar occupation for 14 years. Conditional exemption was asked for on the ground that he was essential to the carrying on of the undertaking. He was in a certified occupation. No previous application had been made for him; he had been previously badged, having been lent by the Cromer branch of the firm for Admiralty work. Mr. Kerr, for the Military Authorities, contended that when he was lent to the Admiralty for a time the firm did very well without him, and the question was, could not they spare him now? The manager said he had no other reliable man to attend to the mains. While this man was with the Admiralty another took his place, but he left in January, and that was the reason why the man appealed for now was brought back. If this man was taken he had no-one to attend to the mains. He had to do it himself last year from January to June. The Chairman said it was absolutely essential to the convenience and welfare of the public that there should be someone who was capable of dealing with accidents. He put it to the military that unless an efficient substitute could be found the interests of the town would be very much prejudiced by the man being taken. He ought not to be taken away from the town until some other man was able to take his place and do the work he was now doing. The Tribunal granted conditional exemption, the Chairman remarking that that decision did not prevent the military authorities bringing up the case again if they could find someone in a lower category qualified to take his place.

At Northampton Tribunal, E. Goulston, 39, category A, electrical engineer, applied for exemption. He said he had been 15 years in business, and would have to close if he was sent into the Army. He was solely responsible for the maintenance and repair of the X-ray, medical, and surgical apparatus, and the electrical installation at Northampton General Hospital, and for the electrical installation and apparatus at Northampton School Clinic. Six months' exemption was given.

At Rugby, a tester at the B.T.H. Co.'s works, who is of Russian nationality, aged 20, and in Class C2, was exempted until March 1st in view of the importance of the work he is engaged upon.

At Weymouth exemption was applied for, for W. S. Beale (26, C2), stoker at the electricity works. It was urged that the man's occupation was most important, that the staff at the works was greatly reduced, and that there was great difficulty in maintaining the works. With the Military assent conditional exemption was conceded.

Before the Hunts Appeal Court, the Military appealed against exemption to January 30th given to the assistant to the electrical engineer at the Winchester Corporation Works. He is 18, and the Military Representative said that the services of so young a man in Class A should be available for the Army at once. It was stated that time was required to train a substitute. The appeal was allowed, the calling-up being fixed for November 29th.

An electrician (31, B2), appealing at Sutton (Surrey), stated that he was the only one left to carry on the business. The appeal was respite for a month, with a view to substitution.

At East Grinstead, Sir G. L. Eyles, The Croft, appealed for C. W. Hollingsbee (33, C3), electric light attendant, and, with the Military consent, he was exempted until March 4th.

At Chichester, three months' exemption was granted to an electrical engineer and contractor (36, Class C2), and a final month to an electrical wireman and fitter (24, C3).

Before the Herts. Appeal Court, exemption was claimed for W. H. Marter (35), electrician at Stanborough Park, Watford, who is in charge of the plant of the International Tract Society, Ltd. The appeal was dismissed, the calling-up being suspended until January 1st.

At Windsor, Mr. H. Fowler, electrical engineer, appealed for F. G. Isgrove (18), his apprentice. Mr. Fowler is serving in the R.N.A.S., and it was urged that if Isgrove had to

join up great hardship would ensue, as there would be no skilled person to take Mr. Fowler's place in the business. A medical examination was ordered.

At Whitby, Mr. J. W. Piggott, electrical engineer to the U.D.C., appealed for an electrical apprentice (18), to enable him to train a 17-year-old youth to take his place in the sub-station, and temporary exemption until March 1st was granted.

At Gloucester, an electrical engineer (40, B1), carrying on business in the city, was conditionally exempted on becoming a Special Constable.

At Tunbridge Wells, Mr. Powell, electrical engineer, appealed for A. T. Spurrell (C1) and A. E. Hills (B1), electric light wiremen. The former was refused exemption, with the calling-up on January 1st, and Hills was exempted until a suitable substitute is found, he to join the V.T.C.

At Rochdale, on the recommendation of the Advisory Committee, exemption until March 31st has been granted to R. Rhodes (39, C2), blacksmith's striker, appealed for by the Corporation Tramways Committee.

At Brighton, the Corporation tramway department appealed for 31 men—a traffic superintendent, four traffic inspectors, five skilled mechanics, a night foreman, and 20 drivers. It was stated that 239 men had left the service for the Colours, and that the engineer was opposed to women drivers of trams. The Tribunal granted four months' exemption. In the course of the hearing, Mr. W. Marsh, the engineer and manager, said that since the last appeal there had been a very bad tram accident at Dover, in which 11 people were killed on the spot. The accident was due to a driver losing his head. He was a discharged soldier, and had suffered from shell shock. Many of the men now driving at Brighton were returned from the Front, but discharged soldiers were not coming forward, as they could not stand the strain. The Brighton system had been open for nearly 16 years, and they had never had a bad smash, but if they put inexperienced men on he would not say what the consequences would be. It would not be safe to put women drivers on the many steep hills of the town. He was employing women in the sheds on heavy and dirty work, and they were keeping to it, but he would not have women drivers. The track was bad, but they had so few men to work on the tracks. They did not want a second Dover. They had some drivers who had stiff legs; they were all right otherwise. If the right foot and leg were all right the men were capable, assuming their general health was satisfactory, to drive a tramcar. The brakes were worked with the right foot.

LEGAL.

ELECTROLYTIC CORROSION OF TELEPHONE CABLE.

AN interesting case was heard by his Honour Judge Hugh Sturges, K.C., in the Blackpool County Court, on November 7th. The action was brought by the Postmaster-General against the Blackpool and Fleetwood Tramroad Co., Ltd., claiming the sum of £16 18s. as damages alleged to have been caused to a telephone cable by a leakage of electrical current from the defendant company's lines.

Mr. Ross Brown, for the plaintiff, remarked that although the amount of the claim was a comparatively small one, a question of liability was raised which both parties desired to have settled. It was contended that, under the Telegraph Act of 1878, the Postmaster-General was entitled to have made good any damage caused to the cable by the defendants or their agents. The defendant company had constructed and ran a tramroad between Blackpool and Fleetwood, on the overhead trolley system. The current, after feeding the car, was supposed to be conveyed back to the generating station by means of the tram-rails, but, probably owing to the imperfect bonding of the line, a leakage of current had taken place. The telephone and telegraph cables of the Postmaster-General run practically parallel with the defendants' line, and the leaking current attacked those cables, corroding the lead sheathing, and resulting in a breakdown of the cable, and, consequently, an interruption of telephonic communication. Owing to corrosion alleged to have been caused by the leakage of current near Red Bank Road, Bispham, a length of 52 yards of cable had to be renewed, and it was the cost of this work which was now sought to be recovered. Mr. Ross Brown read correspondence which had passed between the parties, in which the defendant company pointed out that the tramroad was laid in 1898, while the Post Office cable was laid only two years ago. Mr. Ross Brown admitted that the Post Office were second comers, but he contended that this fact did not invalidate the claim. The defendants suggested that the cables should be bonded to the tramroad lines, and the Postmaster-General replied that he was agreeable, if the defendants would agree to bear the costs. The bonding was done, and the cost was included in the account.

Mr. EDWIN JOHN HAMMOND, engineer, gave evidence as to testing the leakage in July of last year, which, he said, was 5 volts maximum, with a 2 volts minimum, and the latter leakage would be sufficient to cause electrolysis. If the defendants' line had been perfectly bonded the line would have been the easier path for the current to travel back, with very little leakage to the plaintiff's cable. In any case, there might be some slight leakage.

Mr. WILLIAM JOHN ROLFE, executive engineer for Preston district, spoke as to tests made which showed that the current was leaving the rails for the cable, with a damaging effect on the latter.

Mr. Ross Brown: Why was the cable not bonded to the rail in the first instance?

The WITNESS: It is most unusual to bond a Post Office cable with private property, as in certain cases it might be dangerous.

Answering Mr. Wingate Saul, for the defendant company, the witness said that at certain points the cable was only 7 ft. from the defendants' lines. He did not think notice was given to the defendants of the intention to lay the cable, but this was not necessary, as the cable was laid along the public highway.

Mr. JOHN CAMERON, the secretary and manager of the Tramroad Co., said the line was perfectly bonded throughout. The line was tested weekly, and returns made to the Board of Trade every six months which showed that it was in a satisfactory condition and complied with the regulations. He was present when the test was made by the Post Office people, and was told that there was a leakage of from two to five volts. There were, however, other cables in the locality; the public lighting cable was within 30 to 40 ft. of the Post Office cable.

Replying to Mr. Ross Brown, the witness said the position the defendant company took up was that the Postmaster-General, by placing the cable near the tram-lines, took the risk of stray current injuring the cable, and should have taken steps to prevent it.

Mr. WINGATE SAUL said the defendants had not committed a breach of the regulations; and he submitted that there was nothing to entitle the Postmaster-General to succeed in that action. They were in the same position as a railway company with reference to sparks from the engine, and were not liable for any damage that might happen from an escape of electricity from their tramways. The arguments of Mr. Ross Brown referred to works of construction or to telegraph lines that were in existence when the lines were constructed. This cable was placed within 7 ft. of the company's rails, and after the latter had been constructed a period of some 16 years. He urged that it would be an injustice to make the Tramroad Co. liable for the damage to the cable.

His HONOUR intimated that he would reserve his decision, and would give it at a later Court. In any case he would give costs on the higher scale, and would give leave to appeal.

AN ELECTRICAL ENGINEER'S CALLING-UP.

BEFORE the Tipton (Staffs.) Magistrates, last week, Leonard A. Jones (23), an electrical engineer in the employ of the Smethwick power station, was charged with being an absentee under the Military Service Act.

The REPRESENTATIVE of the Military Authorities said that the man received his calling-up papers on October 5th, but they were sent back, and his employers applied for his retention. The application was, however, out of date.

DEPENDANT produced a letter from the Dilution Officer to the effect that he would be retained.

The REPRESENTATIVE of the Military said that letter was written after the date of the calling up.

A REPRESENTATIVE of the firm, and an officer of the Aeronautical Department, said the defendant was indispensable at the power station. He was a highly technical man, and as 95 per cent. of the output was required for munition making, the former said he would not be responsible for the running of the station if the man were taken away.

The MILITARY REPRESENTATIVE: I should be responsible.

The REPRESENTATIVE of the Aeronautical Department said he had authority to appear to ask that the defendant should not be sent into the Army. A technical blunder had been made.

The OFFICER for the prosecution replied that he had the authority of the War Office.

The CHAIRMAN said it appeared to be a case that the Military Authorities must settle between themselves, and to enable them to do that the case would be adjourned for a week, defendant being admitted to bail to enable him to attend to his work in the meantime.

HALL v. PORDES.

MR. JUSTICE BRAY and a special jury, last week, heard an action for wrongful dismissal brought by Clement Hall, a metal worker, of Birmingham, against Bernard Pordes, electrical goods manufacturer, of Christopher Street, E.C. Defendants denied liability, and said they were justified in dismissing the plaintiff because he was incompetent and did not obey the orders of the firm.

PLAINTIFF'S case was that he was in a responsible position as a metal worker in a well-known Birmingham firm for 25 years, and then joined in a partnership to work on his own account. Defendant was in the wholesale electrical lamp trade, which, until the outbreak of the war, was supplied from Germany with these lamps. As it became necessary to manufacture them himself, he placed orders with the firm which plaintiff had joined, and then appointed him his manager in London to make the cases for lamps, setting up a special department in the London works for that purpose. The business was successful, and some 10,000 to 12,000 lamps were turned out weekly. Plaintiff was engaged under the agreement for five years at £3 10s. a week and commission. After two years' duty defendant summarily dismissed him, and he asked for damages.

The jury found a verdict for plaintiff for £440 and costs, and his Lordship granted a stay of execution, and gave judgment accordingly.—*Birmingham Post*.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

The E.T.U. or the A.E.S.E.?

Referring to the letter of Mr. J. R. W. Grainge in your last issue I may say that at a recent meeting of the E.T.U. the members were advised that the Government and the military authorities could no longer be "swanked," and that if they wished to keep out of the Army, as strikes were illegal and their funds would be confiscated if they suggested one, it would be better for them to refuse to work any overtime after they had done the recognised number of hours. This would spread the jobs out and impress the authorities (it was hoped) with the vast amount of work that the wiremen and their mates were doing. This advice elicited from the body of the hall the opinion that if the members refused to take a few extra shillings per week in the form of overtime, which they admitted among themselves was very rarely, if ever, earned, the small amount saved on isolated jobs would not be sufficient to warrant the employment of one or more of their unfortunate brothers who were of military age but not actively employed. The aim of this new programme of the E.T.U., so far as station men are concerned, appears to be based on a new trade card which they are attempting to force on the industry, coupled with total exemption from the Army, &c. Many of the station men present clearly did not approve of the way that the meeting was being conducted, or the nature of the business in hand, and a spokesman on their behalf challenged the Committee with the fact that they had been enrolled as members of the E.T.U. with the above programme as an inducement to join, and after six or nine months' negotiations nothing had happened to benefit them to the slightest degree. It appeared also from the remarks that had been previously made in their hearing that original members, at all events in so far as military service was concerned, were not to much, if to any extent, receiving that protection which had been promised them. The Committee were therefore challenged by the station engineers' spokesman to bring about a conference with the Ministry of Munitions with a view to settling their grievances.

The result of that conference and other matters arising have since been published and discussed very fully in the trade Press.

One who was Present.

I would be glad if you will grant me space to point out to Mr. Healy that my letter was not written for the purpose of shelving problems or obscuring issues. I desired to make known, what is already quite clear to those outside the lofty domain of power station service, that nothing is gained from wage or salary payers unless it be striven or fought for; and that any organisation framed for making the lamb bed-fellow to the lion, inevitably ends in the former's extinction.

Incidentally, it occurred to me that smaller power stations may possibly be devoured when the centralisation monster begins to grow, and that this event may force the responsible shift men in these important places to compete for employment hitherto reserved for those lower-grade individuals, who, in an organising sense, are so naturally catered for by a vulgar body like the Electrical Trades Union.

No! "C.B.T." (A.M.I.E.E.) your hopes are vain; but I have an awkward feeling that it is more dignified to be included in an organisation which is energetic enough to force vital issues (even in war time) than it is to remain a bickering "free lance" or, say, a member of a mutually congratulating, snobbish circle, which snatches the good things but abuses those who get them.

W. F. K.

Your footnote at the bottom of Mr. Grainge's letter is to me a command. Your courtesy is a model to editors. For the last 10 years or so "spasms" bearing my name have appeared in the columns of your paper. Any comments by you have always borne the imprint of fairness and tolerance, and one only wishes all papers were run on the same lines. I have the reputation among my friends, and my enemies, of saying what I think, and I honestly thank you for your kindness to myself. I have never, to my knowledge, met either of you, but hope to have that pleasure some day, and thank you personally.

Now, Mr. Grainge, you must, I think, be a politician, as you have got the usual politician's trick of culling extracts from speeches or writings, and giving them an importance which possibly, if they were taken with the whole, they would not possess. If Mr. Grainge had been a regular reader of the *Electrical Trades Journal*, he would have known why the paragraph quoted was penned. "Our slogan, &c." was a portion of the London District Committee notes written by myself for our September issue, and, rightly or wrongly, represents the feelings of my Committee and our Union. The reason, too, is plain. Over 12 per cent. of our membership are serving with His Majesty's Forces to-day, and 90 per cent. of that number are in line regiments where their technical knowledge and ability are absolutely wasted. I together with our General Secretary, attended last January a meeting, called by the Government, of the skilled engineering trades. We were addressed by Lord Derby, Dr. Addison, General Geddes, and others, and they wanted skilled men for technical corps. Our General Secretary and myself said they could not have any, as we could not supply the demand for skilled electricians at home. Our General Secretary said he had

forwarded to the Ministry and the Army authorities the names of hundreds of our members who were in line regiments, and had asked for their return to civil employment, or their employment in units where their talents would be most useful to the nation. Representatives of other trades also quoted cases of a like nature, amounting in the aggregate to a large number of thousands.

We had promises galore given us that the matter would be rectified. Such promises have not been kept. Here and there a man has been brought back, amounting in the ultimate to less than 5 per cent. of the total.

Every day I have numerous inquiries from employers and Government Departments for skilled electricians, and cannot supply them. Have had to draw hundreds of men from less important and put them on more important work. Yet all the time the Army Authorities are chasing our members; and if any of them go, they are almost invariably put in line regiments. Absolutely one of the best mechanics in London was for nearly two years a telephone room orderly. Another for six months was picking up the litter in the barrack square. Only to-day, Saturday, November 10th, a member came into the office. He is nearly 21, served a five years' apprenticeship with one of the largest firms in Manchester, and is now a first-class electrical fitter. He had a Protected Occupation Certificate, but thought he should do his bit. He was sent to Woolwich for his trade test, and passed with flying colours. He was then sent to Farnborough and passed another trade test for the Flying Corps. He has been drafted to a line regiment at Reading. If I get him put in a technical corps, it will mean writing to half a dozen different people, and before any decision is come to he will probably be in France or Italy—possibly dead.

You will quite understand we had to call a halt. We had to say to the Government, "Hands off our members." We had to say, "This is an electrical engineers' war; and although you are able to teach a woman in a day how to stand by, or rather work, a capstan ~~lath~~, you cannot make electricians in a day or a year."

"We are fighting for our Union and the industry, and are following the lines of the three strongest Trade Unions in the land to-day. There are quite a goodly number of men of military age in the legal profession, and I really think Haig or Jellicoe would rather trust one electrician to blow the Germans to glory than all the lawyers to talk them there."

Then there is the Medical Trade Union. They threatened a short time ago to "pull" all their members from France if any more of their number were taken. Of course, it was not a strike: it was only the threat of one, but it was effective. Plums fall into their lap, too, without striking—witness the £800,000 gift of insurance money, of which the working class was fleeced.

The Church of England Trade Union is also fairly strong. Strong enough to resist conscription and also dilution. There are no women parsons; oh, dear no! They are not doing so badly out of the war either. They get increases of wages, too (tithes, &c.), without going to the Committee on Production.

So you see, Mr. Editors, we are sinning in "good" company. We, in ten years' time, are going to be the fourth strongest Trade Union in the land. We are going to control the electrical industry; but, unlike the others, we are going to control it in the national interest.

As I have taken up so much of your space, I cannot deal very lengthily with Messrs. Jones and Napier. Let me say here and now, the A.E.S.E. does not cut any ice with anyone. About five years ago an article appeared above my name in the *ELECTRICAL REVIEW*. I was writing as a member of the Electrical Trades Union, and I said I did not care what the station engineers did as long as they organised. We, the Electrical Trades Union, stood aside and gave Mr. Ebben a clear field, and also assisted him, but it was of no use. The will to do was there, but the ability evidently was not, so we had to take the work up, and so successfully that in London alone we are over 1,000 strong, and still Charlie's Aunting.

Poor Mr. Napier! If he has any doubt to whom he is indebted for his increase of wages, I should suggest that he has five minutes with Mr. James Devonshire.

W. J. Webb,
London District Secretary,
Electrical Trades Union.

London, E.C.,

November 12th, 1917.

P.S. By the way, I am wondering if Mr. Grainge is of military age.

In reply to Mr. Napier's remarks in *REVIEW* of November 9th, he challenges me to give him the name of a member of the staff who is also a member of this organisation. Surely he does not admit such an elementary knowledge of Trade Unionism as to not be aware of the fact that one of the primary objects are protection to members.

He charges me with misrepresentation concerning the North Metropolitan Award. Why, then, does he not prosecute this Society for publishing a fraudulent award? Surely, being such an important person, he has that power. He states that the question of bonuses was already under consideration; probably, but what accelerated the consideration he does not say. Happily, men of Mr. Napier's calibre are rapidly disappearing, otherwise the industrial outlook would require more than a Commission of Industrial Interest to cope with it. The days of intimidation by such tactics are, thanks to organised labour, over, and we look forward to a period of mutual understanding which will ultimately work out to the betterment of relationship between employer and employed.

H. H. Morion, Secretary,
No. 1 London Branch Station Engineers.

I am desired by the members of the Marylebone Branch of the National Amalgamated Union of Enginemen, Firemen, and Electrical Workers to state that it is one year and three months since they commissioned Mr. Meakin, their London agent, to investigate the wages and conditions of the London and suburban power stations with a view to securing substantial improvement. This branch has never displayed hostility towards any Trade Union catering for gas, water, or electricity employes, and would advise all such unions to compose their differences. All the members of these unions are travelling along the same road, and far better for all there should be harmony and close co-operation.

Until Mr. Meakin took up the matters referred to with the electrical engineers, nothing was done on a large scale; and whatever benefits are being received now by engineers or workmen are directly traced to those small beginnings of 15 months ago. As a matter of fact, the E.T.U. did not wake up to the full sense of responsibility until a question was asked in Parliament on behalf of three certain members of the Marylebone Branch of the N.A.U.E. And the station engineers seem to have held aloof from their comrades in the power stations. The N.A.U.E. has tried to benefit all employes, whatever their grade and station, for sectionalism is no good.

J. Vincent, Branch Secretary,
National Amalgamated Union of Enginemen,
Firemen, &c.

London, N.W., November 12th, 1917.

[The moderation and restraint of Mr. Vincent's letter compel our respect. On the other hand, we have received some letters from other quarters, the contents of which, as is too often the case in such controversies, consist largely of personal references bordering upon abuse; such letters in no way contribute to the solution of the difficulties of the situation—rather they accentuate them—and on this account, as well as the pressure on our space, we refrain from printing them in this column.—EDS. ELEC. REV.]

The Association Movement.

Association is the nucleus of co-operative effort. Herein then we have the promise of a final emergence from the slough into which the design of capitalistic power has managed to throw our generation. That being so, it seems a pity that the contribution published in your last issue, on the leader entitled "The Association Movement," should reject the idea for the instance, and so clothe the C.M.A. with an importance which the political structure of the new influence would belie.

The movement with its pregnant tissues floating loose, as it were, awaiting the masterly tying of a logical knot, is liable to lose the inherent values that lie in its conception, unless handled broadly, with an eye to the body economic.

It is a natural consequence of the war in which we are so vitally engaged, and as such, should be studied, not on the basis of a past adventure, but on its own merits, as significant of a certain tendency of thought, drawing life from the mutation of the industrial ideal that this strife is responsible for.

The mutation of which I speak, is not a something apart—a revelation complete in itself—but only a fragment thrown up by the moral convulsions of the universal mind. It holds in itself possibilities that affect the well-being of the individual, as well as of the mass, and presented more or less as a novel device, the association movement is in truth but an indication that a different phase of State representation—as far as the engineer is concerned—is at hand.

My inferences from France may be judged abnormal, and perhaps theoretical, but when considered in conjunction with the Whitley Report and the Government's definite statement, that "it will give preferential consideration to industrial organisations, in the councils of which labour has its representatives," we see at once that we are dealing with a combination of interdependent facts, rather than a detached link broken off from a chain.

Abstract though the study may appear to be therefore, it is nevertheless essential that the engineer, on the verge of having new and wider functions added to his already important, though somewhat limited, responsibility, in the guiding of the ship of State, should analyse such indications as the association movement for what they are worth.

It is obvious that the Government is seeking to direct part of the scientific brain into a new channel, wherein the labouring proletariat will have a more regulated voice than hitherto. It is not a case of socialism, but rather an endeavour to find a mutual basis, wherein both the aristocrat and the workman of the technical world may meet, and fuse their respective efforts towards the national well-being of a strained community.

The time has come for the engineer to add very seriously—economics to his list of necessary subjects.

Viewed in this light, I feel it were well to take the substance of the association movement as a whole, and not as the somewhat belated shadow of a single—howbeit successful—forerunner.

R. C. Andersen,
B.E.F.

November 4th, 1917.

Referring to a letter which I wrote you on October 18th as to a claim put forward by Mr. H. H. Berry to be the founder of the Cable-Makers' Association, and having in view his letter of October 23rd, replying to my letter, it appears necessary to make a short further statement on the matter, which is one, probably, of so comparatively little interest to the majority of your readers, that I will not occupy your columns at great length on the subject.

At a recent meeting of the Cable-Makers' Association, at which were present five individuals who took part in the first meeting of the Association, besides others who were closely associated with the foundation, Mr. Berry's letter, and also my letter, were read.

I am authorised to state that, in the opinion of those present, my letter of October 18th correctly sets out the position. It is not in dispute that Mr. Berry called on members of the cable trade in 1898, putting forward his views as to the desirability of founding an Association; but at the date he did so, preliminary action had already been initiated by others, and there is universal agreement among those who took part in the foundation of the Association that the putting forward by Mr. Henry Edmunds of certain definite constructive proposals was the step that made possible the formation of the Association, and there never has been any question in their minds that this gentleman was, in fact, the founder of the Association, so far as any individual can claim that title. Lieut. F. S. Paterson, who was present at the first meeting, in his letter to you of October 23rd, 1917, independently bears out this view.

I may conclude by saying that, personally, I do not intend to continue any further this correspondence.

The Cable-Makers' Association.

LEWELLYN B. ATKINSON, Secretary.

London, November 13th, 1917.

BUSINESS NOTES.

Packing Scientific Instruments.—Mr. R. W. Dalton, H.M. Trade Commissioner for New Zealand, complains of the unsatisfactory packing of scientific instruments sent from the United Kingdom. Though allowance is to be made for the present difficult situation in respect of packing, it is felt that proper care is not being taken. To poorly pack expensive scientific apparatus is like losing the ship for the sake of a little tar. Cases of breakage are quoted by Mr. Dalton. At present, no doubt, packages are being subjected in transit to exceptionally rough treatment, and it is suggested that makers should wherever possible send the cases to the ship by hand and put them into the safe custody of the Chief Officer for special stowage, after making proper arrangements with the shipping company.

Trade with Venezuela.—The British Vice-Consul at Maracaibo has reported on the prospects of developing our trade with Venezuela. There should be great prosperity when the termination of the war opens the trade channels for imports from the United Kingdom, but the market requires special studying, as for the past 20 years it has been dominated by Germans. We have been seriously handicapped in the past by the lack of suitable advertising matter for probable buyers. Catalogues must be in the Spanish language and must state terms and prices. Suitable catalogues should be sent to the Vice-Consulate at Maracaibo and they will be distributed among likely buyers. There is a good demand for marine engines for pleasure boats, electrical equipment and general machinery, also hardware. At present the bulk of the hardware is being imported from the U.S.A., Spain and Italy. The Vice-Consul expresses the opinion that the present time offers an admirable opportunity for our firms to be active; no doubt if there be any of them free to cultivate export trade in this market they will take the hint.

L.C.C. Stores Contracts.—The L.C.C. Stores and Contracts Committee reported on Monday that the current contracts for the supply of general stores, with a few exceptions, would expire on December 31st, and they were taking steps for obtaining supplies for 1918. The group of contracts affected includes metals and metal goods, electric cables, lamps, fittings and materials, chemical and scientific goods, rubber and asbestos goods, &c. It is proposed, under prevailing circumstances, to continue the present practice of purchasing some classes of goods at the current market rates, or under special quotations, until trade conditions again become normal, or until it is considered favourable to enter into new contracts. In other cases, however, new forms of tender and schedules are being prepared. Tenders will be received during November and December.

Japanese Electrical Deputation to Australia.—We read in the *Sydney Morning Herald* of September 10th that Mr. Keizo Yoshino, Secretary of Electrical Exploitations and the Bureau of Special Investigations, Tokyo, had just reached Sydney on a visit to Australia to inquire into its electrical undertakings, and to find out how Japanese electrical machinery and appliances might be improved to suit the requirements of the Australian trade. Mr. Yoshino said that while Japan was very busy making munitions of war when he left for Australia, the regular industries were flourishing.

In reply to a question, he said that they had had strikes in Japan recently; but they were all very small. "The Government does not allow strikes on a large scale."

The total number of electrical undertakings in Japan at the close of last year was 2,501, including supply, traction, isolated plants, and official plants. At the close of 1915 there were 250 manufacturers of electrical machinery and appliances in Japan. The value of these manufactures in 1915 was estimated at 36,065,739 yen, including machinery, &c., exported to China, India, Australia, and other places.

German Ship Installations.—A company under the title of the Schiffs Installation A.G. has been formed at Bremen with a share capital of £70,000 for the purpose of carrying out electrical installations, particularly on ships. The participants include the Hackathal Wire and Cable Works, the Lorenz Co., the Lloyd Dynamo Works, and two banking institutions.

Austria's Future Export Trade.—According to the *Wiener Zeitung* of October 16th, the Austrian Minister of Trade has issued an Order providing for the formation of a Committee of Experts for the Export Trade, in which not only the regular export merchants, but also other industrial groups specially interested in exports, are represented. In all questions of essential importance the Committee will act in conjunction with the existing Economic Committee of Merchants. The new Committee consists of not more than 15 members, nominated by the Minister of Trade, and is under State supervision, which is exercised by a Government Commissioner. Among its functions is that of co-operation in measures for war and transition to peace economy which relate to export.—*Board of Trade Journal*.

Book Notices.—*First Course of Electric-Light Switching and Testing.* Arranged by W. P. Maycock, M.I.E.E. London: A. P. Lundberg & Sons. Price 10d. post free.—This little book should prove useful to teachers of practical wiring and other classes where the connection and testing of tumbler-switch circuits form part of the tuition, as well as to individual students, especially those competing for the firm's Preliminary-Grade Certificate. This "First Course" is of a most elementary nature—in fact, the first exercise deals with the trimming of the ends of flexibles and wires; and in the last, the two-way intermediate circuit is fitted. The work and operations are so minutely detailed that there will be little for the teacher to do except to examine and appraise completed work. A list of apparatus shows him at once what is necessary. The "Hints" on the working-out of problems will encourage the student who is in difficulties, and numerous problems are given for him to solve by himself. The instructors of workshop classes which cater especially for wounded soldiers, should find the simplicity of the course very acceptable to their students.

"Links with the Past" is the title of a very acceptable book, well produced and neatly bound, issued by the Eagle and British Dominions Insurance Co., Ltd. It is a restful recreation to turn from reading about the war to study the charming reproductions from old prints of bits of London in "good old times" and from photographs of those who have been directors of the company in the lengthy period of its history. To read of the old coaching days, to be reminded of the ways of Charles II and Nell Gwynn, to remember the old Fleet Street coffee house of literary men, and many other such matters, all woven into the story of the company's history, is not waste of time in days when stress and anxiety render the mind easily wearied.

"Punch's Almanack" for 1918, published this week, will be on sale at the same price as before, 6d. Its cartoons are of the usual high standard of excellence. Four of them dealing with "Germany and the Next War"—the commercial war in which the Hun faces the difficulties in this and other countries where he has bombed and outraged civilian communities—are quite good.

"British Standard Specification for Charging Plug and Socket for Vehicles Propelled by Electric Secondary Batteries. Report No. 74—1917, of the Engineering Standards Committee." London: Crosby Lockwood & Son. Price 1s. net.—The great importance to the electric motor vehicle industry of a standard charging plug and socket, for use with vehicles propelled by secondary batteries, was brought to the notice of the British Engineering Standards Committee, in 1911, by the Electrical Vehicle Committee of the Incorporated Municipal Electrical Association. After consideration, it was decided to adopt the dimensions recommended by the Electrical Vehicle Association of America, in order that interchangeability should be secured between plugs made in both countries, and the Report was issued in December, 1915 (Report No. 74). Early in the present year the Standards Committee (Electrical Vehicle Division) of the Society of Automotive Engineers of America suggested a small modification in the design of the plug, which they found added considerably to the mechanical strength, and did not affect the interchangeability. The proposal was supported by the Electrical Vehicle Committee of the I.M.E.A., and, after consideration by a Sub-Committee of the British Engineering Standards Committee, the modification was adopted. The revised Report was approved by the Main Standards Committee in July of this year, and is now issued in accordance with the new policy of the Committee in octavo size, price 1s. French, Italian and Spanish translations will be available shortly.

"Scientific Papers of the Bureau of Standards." No. 303. Relative Sensibility of the Average Eye to Light of Different Colours, and Some Practical Applications to Radiation Problems." Washington: Government Printing Office. Price 15 cents.

Trade Announcements.—All communications for the Coventry electricity department should now be addressed to the Council Office.

Mr. F. W. Fox, electrical engineer, of Bank Street, Ashford, Kent, is relinquishing business.

Liquidations.—**BOSCH MAGNETO CO., LTD.**—A petition for the winding up of this company is to be heard in London on November 20th.

P. E. T. CONSTRUCTION CO., LTD. Creditors must send particulars of their debts, &c., to the liquidator, Mr. A. Page, 28 King Street, Cheapside, E.C., by November 30th.

Catalogues and Lists.—**MESSRS. COLE, MARCHANT, AND MORLEY, LTD.,** Bradford.—22-page illustrated catalogue, in expanding binding cover, of the C.M. & M. central exhaust steam engines. The principal points concerning these engines, the advantages claimed, diagram of general arrangement, diagrammatic section of cylinder, and notes on the construction of the engines, are set forth. A number of excellent half-tones show the engines installed for electrical and other work. The horizontal compound type of engine is briefly dealt with.

MESSRS. JOHNSON & PHILLIPS, LTD., Charlton, London, S.E. 7.—Two leaflets: No. T1/10 shows their new design of portable testing transformer and No. T1/22 their shell-band heating transformer.

MR. P. W. RANDS, Caxton House, Westminster, S.W. 1.—Price list of electrical plant and apparatus in stock for sale.

MESSRS. GEIPEL & CO., Vulcan Works, St. Thomas Street, London, S.E. 1.—20-page illustrated price list, fully describing and tabulating data regarding some standard ranges of their motor-starting and controlling gear, of which immediate deliveries can be given against M. of M. certificate.

MESSRS. WARD & GOLDSTONE, Sampson Works, Salford, Manchester.—Leaflet describing and pricing the Sampson acid and water proof lampholder.

For Sale.—The Borough of Eastbourne Electricity Department has for disposal one 150-KW. direct-coupled steam alternator and exciter. For particulars, see our advertisement pages to-day.

British Trade with Italy.—The Headquarters of the British Chamber of Commerce for Italy (Inc.) have been removed to commodious premises at 7, Via Carlo Felice, Genoa, where sample showrooms for British goods are being organised.

New German Cable Factory.—It is stated that the work of erecting the large new cable factory for the Insulated Wire Works (late Vogel) of Berlin, is proceeding so actively that the factory is expected to be brought into operation in the company's present financial year.

LIGHTING AND POWER NOTES.

Australia.—**BROWN COAL.**—Referring to the brown coal deposits of Victoria, the Minister of Mines recently stated that, besides surface coal, it was estimated that at 100 ft. down there were 13 million tons; he believed that 2,000 tons a day would be obtained last month. It is supposed that the State policy will be to generate electricity on the Morwell site from this coal, and transmit the energy to Melbourne, while by-products and briquettes will also be secured, the fuel costs being very much less than in the case of the Newcastle coal now used.

MUNICIPAL HIRING POWERS.—The Legislative Council of Victoria has had under consideration the Electric Light and Power Act Amending Bill, which proposes to give power to Councils to sell or let on hire electrical fittings, apparatus and appliances. After considerable discussion, a new clause was inserted applying the Bill to the City of Melbourne, but empowering the Governor-in-Council to apply it, in whole or in part, upon application to any municipality. The Bill subsequently passed all stages.—*Melbourne Age*.

The general manager of the Mount Lyell Mining Co. has cabled from America that investigation by three different experts has proved beyond any doubt that the ore from the Mount Read and Rosebery Mines is splendidly adapted for treatment by the electrolytic process.—*Sydney Morning Herald*.

The Premier of Victoria stated recently that the application of the Victorian Hydro-Electric Co. to utilise the Kiewa river for the generation of electricity, and to sell same throughout the State, has been referred to the Special Committee which is at present investigating brown coal possibilities, and whether the future supply of electric power in bulk should not be under the direct control of the State. Consideration of the company's application has been deferred until the Special Committee reports.

The South Grafton Municipal Council (N.S.W.) has received an offer to install an electric supply scheme in the municipality. The proposal provides for the Council taking over the plant to be installed in the event of the Nymbodia river hydro-electric scheme being adopted at a future date. An effort is to be made to ascertain the views of the Grafton City Council on the Nymbodia scheme, which would serve both municipalities.

The West Gippsland Hydro-Electric Co., Ltd., Warragul, Victoria, has been formed with a capital of £10,000. The source of supply will be the Latrobe river, and it is proposed to install a 250-H.P. plant.—*Tenders*.

The Newtown (N.S.W.) Council is to consider the advisability of securing a site for a municipal electric lighting plant. At the last meeting of the Council it was pointed out that the contract for lighting with the Balmain Electric Light Co. would expire shortly, and the Council by having its own plant could effect a considerable saving, the destruction of garbage could be carried out, and the cost of lighting the streets greatly reduced.

Belfast.—The Corporation has appointed a Committee, consisting of the Lord Mayor and ex-Lord Mayor, the chairmen and vice-chairmen of the Improvement, Works, Tramways and Electricity, Public Health, and Finance Committees, to inquire

into the working of the departments under the control of the four first-mentioned Committees and report as to what, if any, changes in duties at present discharged by the departments it would recommend. It is stated that as regards the tramways and electricity department, the inquiry is chiefly for the purpose of ascertaining the desirability of placing the two concerns each under a separate Committee instead of the present system. —*Northern Whig*.

Bettwsycoed.—An eel in the pipe line recently stopped the local hydro electric plant, the electricity supply being shut down for some time.

Birmingham.—ELECTRICITY SUPPLY DEVELOPMENT. — In acknowledging his re-election, the Lord Mayor (Ald. Brooks) referred to the reorganisation of electricity supply and the proposals which had been put forward to this end. He said the Birmingham Electric Supply Committee had appointed a Special Sub-Committee to consider the problem, and it would report whether the Corporation undertaking could by itself give effect to the aim of the Departmental Government Committee, or whether the object could best be attained by a scheme of development which might comprise a large Midland area of which Birmingham would be the centre, and managed by a joint board representing the various interests concerned. Birmingham must be in the forefront in that development, or it might run the risk of losing its premier position amongst the great industrial communities of the country.

It would appear, from inquiries, that the Birmingham Corporation has already given much consideration to the problem from the point of view of that city's internal requirements, and, in view of the terms of reference, has also had under consideration the question whether the scheme ought not to provide for a supply of electricity to the great industrial area of which Birmingham is the predominant centre. The matter has, in fact, proceeded further than those connected with the Electricity Supply Committee are able to disclose, and important conferences with the Ministry of Munitions are regularly taking place, though nothing definite is settled. One part of the scheme contemplates the linking-up of the existing electricity supply works within the area of which Birmingham is proposed as the centre, while another portion of the scheme takes into account the whole of the electrical requirements for some years ahead in that industrial area, and whether provision should not be made for the erection of one or two huge generating stations upon the best sites, from an engineering point of view, so as to give electrical energy at the lowest possible rate to all consumers. Regarding the problem of control and management, it is pointed out that there are difficulties owing to the fact that portions of the area are not supplied with electricity, while other portions are served only partially and in varying degrees by power companies or municipalities.

Brandon (N. Devon).—FIRE.—A fire which broke out at the electricity station, on Monday, caused some damage in the engine room.

Burton-on-Trent.—PRICE INCREASE.—It is anticipated that the 10 per cent. increase on electricity charges will add £2,000 to the revenue and about meet the extra cost of coal. Nine years ago slack was obtainable at 2s. 10½d. per ton, but to-day the price is 11s. 1d. per ton.

Canada.—The Hydro-Electric Power Commission of Ontario has refused the city of Niagara Falls (Ont.) permission to build a submerged dam in the upper Niagara River for the purpose of supplementing the city's water supply. It is pointed out that every gallon of water is urgently needed for power purposes. In the meantime the city will be allowed to supplement its supply from the Ontario Power Co.'s conduit. —*Canadian Electrical News*.

Chelmsford.—The Electric Supply Corporation has informed the T.C. that it cannot consent to any further extension of the time during which the Corporation may give notice of its intention to acquire the undertaking, unless some protection is given against the undertaking being transferred at a price based upon its reduced value as a going concern under war conditions. If this protection were given, it would consent to an order being made, extending for two years the time for giving notice, subject to the Council not applying to the B. of T. for a further order. The T.C. has decided to take no further action in the matter.

Chesterfield.—PRICE INCREASE.—The T.C. has decided to increase all prices (except those with coal clauses) by 12½ per cent., making 25 per cent. on pre-war prices.

Clayton (Yorkshire).—E.L. PROPOSALS.—At the D.C. meeting, last week, a letter was received from the Electrical Distribution of Yorkshire, Ltd., asking for a definite answer as to the Council's attitude to the company's proposed renewal of application for power to supply electricity to the district. The letter reopens the controversy which took place last year between the Council and a ratepayers' meeting, which demanded that the supply should be obtained from the Bradford Corporation. There are fears in the township that the Bradford offer, which found much favour with the inhabitants, was part of an effort to secure the incorporation of the place with the city. Bradford would, it was stated bring electricity to Clayton within two years after the war under an incorporation agreement. Eventually the Council decided to inquire as to Bradford's terms at present.

Derby.—PRICE INCREASE.—The T.C. has decided to increase the charges for electricity by 10 per cent. The chairman of the Electricity Committee stated that at the present time the

electricity undertaking was using 30,000 tons of coal per annum, for which it was now paying £11,000 a year more. By the increase of 10 per cent. in the charges two years ago nearly £6,000 a year was produced, or about half the amount of the extra cost of coal. The Council approved a recommendation that £1,500 be granted to cover the cost of land for coal storage.

Doncaster.—PRICE INCREASE.—The Electricity Committee recommends an advance in the price of electricity of 15 per cent., making a total advance of 25 per cent. on pre-war charges, as from December 1st this year. An amendment, moved at a meeting of the Council in Committee, in favour of a total 30 per cent. increase, was defeated.

Edinburgh.—PRICE INCREASE.—The Corporation Electric Lighting Committee reported that the increase in the price of coal of 2s. 6d. a ton would mean an increased cost to the undertaking of about £1,700 up to May 15th, 1918. The estimates for the year showed a credit balance of about £1,000. Utilising this with the present rates for electricity, there would be a loss of about £2,400 at the end of the year. It was estimated that an increase of ½d. per unit on lighting from October 1st would bring a credit balance of £500 on May 15th, 1918. The recommended increase, which brings up the rate for lighting to 3½d. per unit, was adopted.

Faversham.—The Electric Supply Committee is to report on extensions needed to supply a shipbuilding yard to be established in the town.

Greasborough.—The U.D.C. has decided to oppose the proposal of the Rotherham Corporation to include Greasborough in its area for the supply of electricity.

Huddersfield.—A statement submitted to the T.C., last week, showed that in the electricity department the supply of current to ordinary consumers had had to be somewhat restricted during the past year owing to the demands for power. The Committee was stated to be considering extensions to the plant.

Keighley.—WAGES.—The War Wages Committee recommends an increase equal to 15s. per week on pre-war rates of pay of all full-time male employees of the Corporation over 21 years of age—with a few particular exceptions—to be regarded as a war bonus and to replace any bonus previously granted. The bonus is to continue for three months after the declaration of peace.

The Electrical Committee is seeking power from the Board of Trade to disconnect non-essential electricity consumers, in order to concentrate on the supply of important works, if the necessity should arise.

Leatherhead.—The Leatherhead and District Electricity Co. is installing additional generating plant to meet the demand for power purposes, and private consumers are asked temporarily to curtail their requirements in order to assist matters.

London.—L.C.C.—The Finance Committee recommends the sanction of the Council to the borrowing of £1,484 by the Woolwich B.C. for a 1,000-kw. motor transformer.

Manchester.—WAGES.—The Corporation is taking steps to oppose an application by the National Union of General Workers and the Workers' Union for an advance of 5s. per week in wages of all workmen of 18 years of age or over in a number of departments, including those of electricity supply and tramways (permanent way). The application is to come before the Committee on Production. In this connection Sir George Askwith, Chief Industrial Commissioner, has written to the Corporation that, having in view previous demands and awards given, and considering the new claims, he will be glad to know if municipal authorities have considered the practicability of making an agreement with the various workers' Unions on the subject of general wages changes on the lines of the agreement existing in the engineering and foundry trades, chemical trades, &c. There is every prospect of all concerned accepting the invitation, though no definite decision has yet been arrived at.

Norden.—PUBLIC LIGHTING.—The Rochdale authorities having agreed to the fixing of electric lamps to the tramway standards, the U.D.C. has decided to have one fixed to every tenth standard.

Nottingham.—Recently a motion by Mr. Atkey, before the T.C., proposed that in connection with the national scheme of reorganisation of electricity supply, it was desirable that the advantages of Nottingham should be placed before the Government as the site of one of the large power stations, and that a Committee be formed to consider the national scheme and report.

PRICE INCREASE.—The electricity charges have been increased by 7½ per cent., in order to avoid a loss on the undertaking next year.

The Corporation employees, who have already received a substantial war bonus, are agitating for further advances, estimated to cost £60,000 annually. The Corporation has asked the Government authorities to intervene. —*Times*.

Peterborough.—It has been decided that the Electric Traction Co. shall be charged 20 per cent. extra for electricity, the same as other power consumers.

Rotherham.—PROV. ORDERS.—The R.D.C. has under consideration proposals of the Rotherham Corporation and the Electrical Distribution of Yorkshire, Ltd., to apply for prov. orders for supplying current for lighting and power purposes.

Sandwich Islands.—According to the *Electrical World*, the Hilo (Hawaii) Electric Light Co. is making considerable progress during the year connected 40 electric ranges, 85 water heaters, and about 1,000 socket appliances. 600 h.p. of additional motors have also been connected. The company has ordered a 1,000-h.p. hydro-electric unit, and another water-power development is contemplated. The reconstruction of the street lighting system is being undertaken.

Sheffield.—PRICE INCREASE.—Feeder cable is to be laid from Neepsend, at an estimated cost of £1,585. To meet the advance in the cost of coal, all accounts for the supply of electricity now charged at 2d. per unit and under are to be subject to an increase of 25 per cent. in lieu of the previously-decided increase of 20 per cent. The charge is to commence after the December readings. The Parliamentary Committee is advising the Council to confine its application for a Provisional Order to the following districts, viz.:—Handsworth U.D., Wortley R.D., Norton R.D., Dronfield U.D. and the parishes of Coal Aston and Dronfield Woodhouse.

Spenborough.—PROPOSED LOAN.—The U.D.C. has decided to make application for sanction to borrow £8,217 to carry out extensions at the electricity works.

St. Annes.—In reporting on the heavy demands on the electricity works, Mr. Clothier, the engineer, recommends an increase in the steam plant.

St. Helens.—PRICE INCREASE.—The Electricity Committee has decided that the charges for electricity for power and lighting be increased as from October 1st, 1917, by 50 per cent., instead of 30 per cent. as hitherto.

Slaithwaite.—PROVISIONAL ORDER.—The Huddersfield Corporation has given notice of its intention to make an application to the B. of T. for a Provisional Order for supply within the urban district.

U.S.A.—The electric display lighting of New York, including the huge advertisements which have made Broadway historic, will in a few days be discontinued, except between the hours of 7.45 and 11 p.m. It is estimated that 125,000 tons of coal annually will thereby be saved.

Walsall.—The Corporation, having completed the new electricity generating station, is making a big effort to attract manufacturing enterprises. It points out that it has a large amount of surplus power, and that the town is on the fringe of the Cannock Chase coalfields.

Wharfedale.—E.L. PROPOSALS.—The Electrical Distribution of Yorkshire, Ltd., are seeking support of the local Councils of Wharfedale to the proposed development of their supply services in the Menston, Burley, and other areas. At a meeting of the Burley-in-Wharfedale Council, last week, it was stated that the company would not agree to a purchase clause, and the Council decided to withdraw its support.

Wolverhampton.—YEAR'S WORKING.—The annual report mentions that the largest generating set failed, and was out of commission for six weeks, necessitating curtailment of supply. A large new factory took some 2,800,000 units during the year, and its requirements are such that a further 5,000 kW. of plant has had to be ordered, and until available (early next year) the curtailment of supply in certain directions continues. Negotiations have taken place with several large firms which contemplate building works in the area, and one has already purchased the necessary land.

TRAMWAY AND RAILWAY NOTES.

Australia.—The first report of the Melbourne Tramways Board for the year ended June 30th, 1917, states that the traffic receipts totalled £811,781, and a net surplus of £381,167 resulted. Of this £25,000 has been transferred to the renewal reserve fund, and £100,000 to a reconstruction reserve account for extensive renewals of tracks, reconstruction of power houses, &c., which may be required in the near future. After debiting all charges and appropriations, the surplus for the year is £210,019. The credit at the tramway fund, from which the compensation ultimately awarded to the company will be paid, amounts to £384,597.

The Melbourne City Council has decided to oppose the Victorian Government Tramways Bill in its present form and has recommended the Metropolitan Tramways Conference to oppose its passage into law until amendments are made in the method of election of members and the allocation of districts, &c., as provided in the Tramways Bill promoted by the Metropolitan Municipalities and introduced to Parliament in 1913.

MELBOURNE SUBURBAN RAILWAY ELECTRIFICATION.—It was stated recently by Mr. E. B. Jones, the Victorian Railway Commissioner, that the effect of transferring the contract for certain portions of the electrical equipment to America was a reduction in the price, which was not now much in excess of Mr. Morz's actual estimate, *Melbourne Age*.

The report of the Adelaide Municipal Tramways Trust for the six months ended July 31st states that, although there had been a record revenue, expenditure had so increased as to absorb the credit balance of £1,381, and leave a deficit of £2,199. The additional expenditure is accounted for by the increased cost of coal and materials, increase in wages, and the rate of interest.

Birmingham.—It was decided on Tuesday last not to run the tramcars or omnibuses on Christmas Day.

Blackburn.—The Lancashire and Cheshire Tramway Managers' Association has accepted the invitation of the local Tramways Committee to hold its November meeting in the town.

Bradford.—PARCELS DELIVERY.—A deputation from the Hull Tramways Committee visited the city last week, to study the parcels delivery system which has been working in Bradford for some years past under the tramway authority. It is proposed to establish a similar branch of the Hull Tramways Department.

Brazil.—According to the financial Press, the Secretary of Agriculture of the State of Sao Paulo has decided to electrify the railway between Sao Paulo and Boituba. It is stated that this will reduce the cost of transport from this important agricultural area.

Constantinople.—A report through German channels, at Brussels, refers to the Compagnie des Tramways et d'Electricité de Constantinople, which is known under the name of the Constantinople Consortium, which is managed by the Société Financière des Transports, and in which prominent German banks are also interested. The report states that the company has just declared a dividend on the ordinary shares at the rate of 4½ per cent. for 1914-15 and also for 1915-16, which is to be distributed on a future occasion; but no payment is proposed to be made on the other classes of shares. It is added that difficulties are experienced in obtaining raw materials, and only the tramways are in course of favourable development.

Derby.—The Tramways Committee recommends that application be made to the L.G.B. for a further extension of one year for the execution of the tramway work authorised by the Corporation Act, 1913. The tramway receipts for the five weeks ended October 27th, 1917, were £6,224, an increase of £428 over the corresponding period of last year.

Glasgow.—In connection with the announcement by the B. of T. of the appointment of a Special Committee to consider the needs of tramway undertakings as to materials and labour, the local system has, despite a shortage of plant and other handicaps, kept running at a high degree of efficiency, and it has been found possible to give assistance to less fortunate undertakings in Scotland and England. The fact that the department has organised its own repair system very thoroughly has been found of great value. The policy of the B. of T. Committee is to concentrate available material, and in Glasgow it is reported as probable that some of the residential suburban routes may be deprived of their car service, and, should necessity arise, the rails and other plant may be removed.

Huddersfield.—A statement submitted last week shows that the tramway track is in a very bad state of repair, owing to war conditions, and that nothing can be done in the way of thorough renewal until after the war. As a temporary measure of repair, the Tramways Committee, it is stated, has decided to enter into a contract with the Woods-Gilbert Rail Planer and Milling Co. for the grinding and milling of certain sections of track, which, it is held, will prolong the life of the rails from five to seven years.

YEAR'S WORKING.—The tramway receipts for the year ending September 30th amounted to £116,215, an increase of £9,603 on the previous year's figures. The number of passengers carried was 27,580,552, an increase of 1,252,070, whilst the car-mileage of 2,568,874 was a decrease of 12,993. The staff now included 143 females.

London.—L.C.C.—With reference to the curtailment of transfer tickets, &c., the chairman of the Highways Committee has made the following statement:—"The experience of the management confirms the Committee's expectation that the alteration in transfer facilities would lead to more effective control over the traffic; and it is satisfactory to note that the alteration is having the effect of improving the carrying capacity of the tramways by acceleration of the services. It was to be anticipated that any change not obviously for the benefit of passengers would lead to criticism, and, perhaps, to complaints. The Committee is glad to find that the volume of well-founded complaint has been infinitesimal."

Ramsbottom.—TRAFFIC FIGURES.—The half-yearly return of the Council's railless-car system shows a good improvement on last year, although, owing to war conditions, there is still difficulty in maintaining a full service. The population served is 10,000, and has been carried 28 times during the half-year, excluding the return journeys of workmen, and over 10,000 wounded soldiers. The miles run were 38,598, against 37,325 for the corresponding period of last year; 31,710 workmen were carried, and 219,270 ordinary passengers, making a total increase on 1916 of 36,500. The receipts were £1,676, as against £1,165, and the average receipts per car-mile were 10'425d., against 9'418d. last year.

Newcastle-on-Tyne.—ANNUAL REPORT.—Mr. E. Hatton, engineer and general manager of the Corporation tramways, in his annual report says the increase in income (£31,810) is again a notable feature, and is due to the unprecedented conditions prevailing in this area. At the same time, the abnormal conditions have likewise entailed heavy working expenses. The great utility of the car service is clearly shown when it is stated that 78,189,216 passengers were carried in 1916-17, an increase of 5,137,615 over 1915-16, and 13,103,794 over 1914-15. On traffic expenses alone working costs had increased approximately £9,500, and, coupled with an increase of £14,500 on the previous year, made a total increase in the department alone of £24,000 over 1914-15. The aggregate total increase in wages to employees in all departments during the year was £12,910. The only section of the expenditure showing a reduction was general expenses, where the amount payable for local rates, following extended negotiations and litigation with the Poor Law Authorities, had been reduced by approximately £8,000. The increasing demands for a better service of cars for workmen had added to the difficulties of working the undertaking. As showing the extent of the catering for workpeople, more than 380 car loads (averaging 100 passengers per car) are dealt with daily. Mr. Hatton concludes that as they are only able to maintain about 180 cars in service, it is evident that little more can be done in regard to increasing the workmen's service.

On November 5th an electric train from Tynemouth was derailed outside the Central Station; no passengers were hurt, but the line was blocked for some hours.

Reading.—YEAR'S WORKING.—The annual report of Mr. Craven, general manager and engineer of the Corporation tramways, for the year ended March 31st, 1917, shows a total revenue of £44,597, and working expenses amounting to £23,817, which, with war service allowances and war bonuses of £2,132, totalled £25,949, leaving a gross profit which, with bank interest, amounted to £18,647. Interest, sinking fund, and other charges absorbed £19,294, leaving a net surplus of £5,723, as compared with £6,232 in 1916, of which £4,000 has been transferred to the rate relief account and £1,723 to the renewal reserve fund. The total capital expenditure to date is £230,789, the total amount of the sinking fund is £80,183, and reserve fund £24,122. During the year, 10,919,533 passengers were carried and 912,258 miles run, as compared with 9,953,906 passengers and 924,656 miles in the previous year; 140,767 parcels were carried on the tramways during the period under review, producing a revenue of £812 and a net profit of £137.

Shelf.—The U.D.C. has received notice from the Halifax Corporation that it intends to make application to the B. of T. for an Order extending the period for completion of tramway works in Shelf until August 18th, 1919.

U.S.A.—On July 26th last, the last horse car on the New York tramways was withdrawn, the route, which had been operated at a loss, being abandoned.

The Philadelphia City Transit Department has awarded seven contracts for the construction of the city's high-speed subway and elevated railway, involving an expenditure of 15½ million dollars.

Walsall.—The Electricity Committee has reported to the T.C. that it has forwarded a protest to the Coal Controller against the increased price of coal being made retrospective to September 17th. It was stated by Alderman Cope that if these extra expenses continued the Tramways Committee would have to ask for an increase of fares. The Birmingham and Midland Omnibus Co. has declined the Corporation's suggestion that it should cease to run buses in the Walsall areas, and join up at Great Barr to the Walsall tramway service.

TELEGRAPH AND TELEPHONE NOTES.

A Wireless Subterfuge.—The story how a young wireless operator fooled the enemy was related in the Prize Court on Tuesday, when the Crown was asked to condemn the s.s. *Edna* on the ground of un-neutral service and enemy ownership. The plucky operator was Mr. G. D. Smith, an Englishman, who has since received a commission in the R.N.A.S. The *Edna* took on board wireless and gun-sight apparatus, and tried to communicate to the German cruiser *Leipzig* the sailing of British ships—an attempt which was frustrated by Smith.

Before leaving San Francisco, he had heard that the coal taken on board was intended for the *Leipzig*. A German wireless operator was taken on board, and Smith was told that if he refused to do his duty the German would take his place. The German operator, however, did not understand the Marconi system, and Smith shortened the length of the waves, and, though he appeared to be sending out calls for the *Leipzig*, no ship could pick up the message.

The German operator spent three nights and three days trying to call up the *Leipzig*. Smith returned later, and then occasionally called up the German cruiser, putting the wireless right in order to delay suspicions; but the wireless was always out of gear when the German operator tried to use it. At La Paz Smith forwarded a message to the Admiral on the U.S.A. cruiser *California*.

Some of the officers threatened to shoot Smith and throw him overboard if he did not send a code message to the German cruiser, and he then pretended to send it.

The only thing that Smith sent to the *Leipzig* was an inquiry as

to where she was, which brought forth a reply that she was hanging around waiting for the *Edna*. Finally the latter was commandeered by the Mexican Government, who put an officer on board, and Smith said that "after that things were more comfortable."—*Daily Chronicle*.

Alien Enemies and the Telephone.—Sir George Cate, replying to a question by Mr. Joynton-Hicks as to the use of a telephone by Hugo Wiskemann, of the Wool Exchange, the son of a German lawyer, said:—Under Article 22-A of the Aliens Restriction Order an alien enemy may not have a telephone without the special permission of the police, which is very rarely given. I am informed that permission to have a telephone was given by the police to this man, who has been 37 years in England, is married to an English wife, and is carrying on under supervision a business which is considered to be useful to this country. I propose, however, to reconsider the whole question of granting these permits to alien enemies. *The Times*.

Norway.—It is reported that the construction near Stavanger of a wireless telegraph station, which will probably be the most powerful in the world, has been nearly completed. A representative of the Marconi Co. will superintend the testing of the station, which it is expected will take place before the New Year.—*Morning Post*.

Restricted-Hour Telephony.—Leeds Chamber of Trade is advocating the general suspension of the telephone service for an hour at mid-day, in these days of short-handed staffs. It has been reported by Leeds shopkeepers that it is becoming increasingly difficult to get answers to calls at mid-day, partly owing to places being closed during the staff dinner hour. Some Leeds firms have already notified their business connections of a closed hour for the telephone.

CONTRACTS OPEN AND CLOSED.

OPEN.

Aberdeen.—November 19th. G.N. of Scotland Railway. Telegraph material for six or twelve months. Stores Superintendent, 80, Guild Street.

Australia.—PERTH.—December 5th and 12th. Postmaster General's Department. Telegraph and telephone instruments and parts, battery material and telephone switchboards, parts, &c. See "Official Notices" to-day.

NEWCASTLE, N.S.W.—December 5th. City Electricity Department. Single or three-phase transformers. Particulars from Electrical Engineer, Council Chambers.

MELBOURNE.—December 4th. (Extended from November 7th.) P.M.G.'s Department. Telephone and switchboard cable for all States.

ADELAIDE.—December 12th. P.M.G.'s Department. Telephone material, cells, telephone parts, &c.

SYDNEY, N.S.W.—December 6th. P.M.G.'s Department. Silk covered and enamelled insulated wire.

Bradford.—November 24th. General stores for tramway department for one year. Particulars from Tramway Offices, 7, Hall Ings.

Carlisle.—December 4th. Electricity Department. One 1500/2000 kW. turbo-alternator and one surface condensing plant. See "Official Notices" to-day.

Dublin.—November 22nd. Electricity Supply Committee. Twenty-four D.C. magazine flame arc lamps. See "Official Notices" to-day.

Enniskillen.—December 1st. Sligo, Leitrim & Northern Counties Railway Co. Telegraph material for 12 months. Mr. J. Duff, Secretary, Enniskillen.

Manchester.—December 12th. Three fan draught cooling towers at the Stuart Street station, for the Electricity Committee. See "Official Notices" to-day.

Newcastle-on-Tyne.—November 22nd. Tyne Improvement Commissioners. Six and twelve months' supply of incandescent lamps and arc lamp carbons. Mr. J. McDonald Manson, General Manager and Secretary, Bewick Street.

Warrington.—November 17th-22nd. Cheshire Lines Committee. Telegraph materials and carbons for twelve months. Stores Superintendent.

CLOSED.

Australia.—Commonwealth Department of Works and Railways. One 5-ton electric overhead travelling crane for the naval establishment. £1,911.—Babcock & Wilcox.

VICTORIAN RAILWAY DEPARTMENT. 300-watt, 220-volt gas-filled incandescent electric lamps, at 15s. 6d. each, 200-watt, 220-volt do., 13s. each.—Australian General Electric Co.

SYDNEY.—As the British General Electric Co., Ltd., intimated to the City Electrical Engineer that a serious mistake had occurred in their tender for booster plant for the Castlereagh Street sub-station, and that they did not wish to proceed with it, negotiations have been opened with the next lowest tender (Messrs. Wm. Adams & Co., Ltd.) who quoted £6,182 for two battery boosters and one milking motor-generator.

FORTHCOMING EVENTS.

- Junior Institution of Engineers.**—Friday, November 16th. At 8 p.m. At 39, Victoria Street, S.W. Paper on "Apprenticeship of Engineers," by Mr. Towse.
- Institution of Mechanical Engineers.**—Friday, November 16th. At 6 p.m. At the Institution of Civil Engineers, Great George Street, S.W. Paper on "Some Notes on Air Lift Pumping," by Mr. A. W. Purchas.
- Electro-Harmonic Society.**—Friday, November 16th. At 6.15 p.m. At the Holborn Restaurant (Venetian Chamber). Concert (ladies' night).
- Birmingham and District Electric Club.**—Saturday, November 17th. At 7 p.m. At the Swan Hotel, New Streets. Paper on "Publicity," by Mr. H. Foulds.
- Institution of Post Office Electrical Engineers (London Centre).**—Monday, November 19th. At 1 p.m. At the Royal Society of Arts. Paper on "The Electrical Physics of the Atmosphere," by Mr. J. E. Taylor.
- Royal Society of Arts.**—Wednesday, November 21st. At 4.30 p.m. At John Street, Adelphi, W.C. Inaugural address on "Science and its Functions," by the Chairman of the Council, Mr. A. Campbell Swinton, F.R.S.
- Institution of Electrical Engineers.**—Thursday, November 22nd. At 6 p.m. At the Institution of Civil Engineers, Great George Street, Westminster, S.W. Paper on "Gas Firing Boilers," by Mr. T. M. Hunter.
- Student's Section.**—Friday, November 23rd. At 7 p.m. At the City and Guilds (Engineers) College, Exhibition Road, Kensington, S.W. Opening meeting. Address by Sir Oliver Lodge, F.R.S., on "Astronomical Applications of the Electrical Theory of Matter."

NOTES.

Electrical Trades Union.—We have received copies of handbills calling an open meeting of station men for Monday next, at 7.30 p.m., at the Holborn Hall, Gray's Inn Road, E.C. 1. It is being held under the auspices of the London District Committee. The handbill says: "London Station Engineers: membership over 1,000."

Electricity in Farming.—In a recent New Zealand paper, Mr. R. M. Matheson, of the Rangotea Dairy Co., referred to the use of electricity on farms in the Taitapu district, where electricity is largely used for lighting the farm buildings, yards, &c., and for milking operations. Energy is distributed locally from the Taitapu dairy factory, no meters being used on the farms, which are charged flat rates—i.e., £9 per annum for lighting the yard and driving the milking machine and separator, while for a herd of 60 or more cows the charge is £18 per annum, this being the maximum. For home lighting and other domestic uses a charge of 5s. per month is made. The scheme is considered a great success by the farmers, equally as regards economy, efficiency, and cleanliness.

Electrical Incubation.—The Sydney Daily Telegraph recently referred to experiments carried out some years ago at Hawkesbury College with electric incubators, which showed their superiority to the lamp incubator. The most important feature was that the electric chicks developed better, and at a month old were 25 per cent. heavier than those from the lamp incubator.

The incubator then used had a faulty temperature control, though at the present day several suitable automatic regulators are available. The *Hobart Mercury* mentions an installation for hatching and rearing chickens at New Town, with 250 and 400-egg incubators, fitted with temperature regulators, which have been designed locally.

Iron-wire Transmission. A recent issue of our American namesake described a small rural farming electric supply company, composed of 25 farmers, who provided the money and built their own transmission line. The supply, at 6,600 volts, 60 cycles, obtained from the Wisconsin River Power Co., is carried by a No. 4 galvanised iron wire main line, with laterals of No. 6 galvanised iron wire; at a typical farm, two 5-kw. single-phase transformers are installed in open delta, three-phase 250-volt current for power being taken off the two secondaries, while single-phase 140-volt current for lighting is taken from one-half of the secondary of one transformer.

Mr. R. E. Protheroe, presiding at an address by Prof. Wood on Food Stuffs, &c., at the Regent Street Polytechnic, said he looked forward to the great benefit that science could confer on agriculture. Farmers now recognised the value of science, and no longer turned the cold shoulder to scientific experiments.

An Indian Bank for Industry.—The Bombay correspondent of the *Times* states that the Tata Industrial Bank is being formed with an authorised capital of £4,000,000, which will have as one of its special functions the assisting of industrial development. "The bank will have an expert intelligence section, scientific and commercial, to report on schemes brought to its notice."

Institution and Lecture Notes.—Institution of Electrical Engineers. At the meeting held on Thursday, last week, Mr. W. M. Morley announced the death of Mr. W. du B. Duddell (past-president), and briefly recounted the valuable services which he had rendered to the Institution and the electrical industry before proposing a resolution of condolence with Mr. Duddell's relatives, which was passed by the members standing in silence. Mr. C. P. Sparks (the retiring president), then presented the premiums awarded to the authors of papers during the past session, and installed the new president (Mr. C. H. Worthingham) in the chair. An abstract of the inaugural address is commenced elsewhere in this issue.

The opening meeting of the SCOTTISH LOCAL SECTION was held in Glasgow on Tuesday last, when Mr. A. Page (the new chairman) gave his presidential address. Dealing with the electricity supplies of Scotland Mr. Page referred to the appointment of the B. of T. Committee on electricity supply. He said that, in accordance with the plan of that Committee, the smaller and older power

stations, with their comparatively inefficient plant, would be gradually shut down, and that power would be generated in big central power stations. The proposed developments, he explained, had for their purpose the conserving of the coal wealth of the country and the cheapening of the cost of power to manufacturers, so as to assist them to compete successfully in the markets of the world. He showed how economies could be brought about mainly through the improved efficiency generally in the process of transformation of the energy in coal into electricity, the use of waste heat and water power, improved load and power factors, growth of standardisation, and more equitable taxation on electrical undertakings. He also commented at some length on the various sources from which were likely to come outlets for electrical energy—namely, the electrification of railways, the application of electricity to metallurgical and chemical processes, and also to agriculture. Mr. David A. Starr (the retiring chairman) occupied the chair at the outset, and introduced Mr. Page.

The first meeting of the session of the WESTERN LOCAL SECTION was held at the South Wales Engineers' Institute, Cardiff, on Monday last. Mr. R. Howard Fletcher was inducted to the chair by Mr. W. A. Chamen, who, in alluding to the absence of Prof. D. Robertson (the retiring chairman), referred in eulogistic terms to the interest Prof. Robertson always evinced in anything appertaining to the Western Local Section. Physical inability alone prevented him from coming to Cardiff. Mr. R. H. Fletcher then read his inaugural address, which was followed by a brief discussion. Mr. W. A. Chamen stated that a great deal of the present unsatisfactory relationship between employers and employes could be alleviated, if not actually removed, by the men thoroughly appreciating that the employers were not making the supposed abnormal profits at the expense of the employes' labours. He gave a case in point where dissatisfaction was immediately removed when the men were informed of the true state of affairs. Mr. Teasdel remarked that legislation ought to be brought to bear to enforce the obligations of the men, as well as the employers, in any dispute that might arise; until this came about he could not see how conditions could very much improve.

Royal Society of Arts.—The following are the arrangements for meetings during November and December:—

Wednesday, November 21st, 4.30 p.m., inaugural address of the 164th session of the Society, on "Science and its Functions," by A. Campbell Swinton, F.R.S., Chairman of the Council.

Wednesday, November 28th, 4.30 p.m., (ordinary meeting), G. Holt Thomas, chairman Aircraft Manufacturing Co., "Aerial Transport After the War."

Monday, December 3rd, 4.30 p.m. (Cantor Lecture), Prof. H. C. H. Carpenter, M.A., Ph.D., M.Inst.M.M., "Progress in the Metallurgy of Copper" (Lecture I).

Wednesday, December 5th, 4.30 p.m. (ordinary meeting), Sir Dugald Clerk, R.S.E., D.Sc., F.R.S., Inaugural Trueman Wood Lecture.

Monday, December 10th, 4.30 p.m. (Cantor Lecture), Prof. H. C. H. Carpenter, "Progress in the Metallurgy of Copper" (Lecture II).

Wednesday, December 12th, 4.30 p.m. (ordinary meeting), Lord Charnwood, "Technical Training for Disabled Soldiers and Sailors."

Thursday, December 13th, 4.30 p.m. (Indian Section), D. T. Chadwick, I.C.S., "The Trade of India with Russia, France, and Italy."

Monday, December 17th, 4.30 p.m. (Cantor Lecture), Prof. H. C. H. Carpenter, "Progress in the Metallurgy of Copper" (Lecture III).

Wednesday, December 19th, 4.30 p.m., Prof. J. Wemyss Anderson, M.Inst.C.E., M.I.Mech.E., "The Cold Storage Industry."

The following papers are among those to be read after Christmas:—

Lord Leverhulme, "The Relations Between Labour and Capital—Reasonable Hours, Co-partnership, and Efficiency."

W. L. Hichens, Chairman of Messrs. Cammell Laird & Co., "Labour Economy and Works Organisation."

Sir W. H. Clark, K.C.S.I., C.M.G., Comptroller-General of the Commercial Intelligence Department of the Board of Trade, "The Work of the Board of Trade Department of Commercial Intelligence."

Sir R. Armstrong-Jones, M.D., F.R.C.P., F.R.C.S., "The War and its Effects on the Mind."

A. Newlands, M.Inst.C.E., Chief Engineer Highland Railway, "Water Power in the British Isles."

F. S. Courtney, M.Inst.C.E., Consulting Engineer to the Royal Agricultural Society of England, "Agricultural Machinery."

M. O. Forster, D.Sc., Ph.D., F.R.S., "Organic Chemistry in Relation to Industry."

A. Dickinson, M.Inst.C.E., "Water Power in India."

H. M. Surtees Tuckwell, M.I.Mech.E., "The Tata Iron and Steel Works" (India).

C. du P. Chiappini, Trades Commissioner for the Union of South Africa, "The Industrial Resources of South Africa."

A series of papers has also been arranged dealing with the application of scientific research to the development of particular British industries.

The Cantor Lectures include a series of three by Mr. R. Darling on "High-Temperature Processes and Products" (January 21st, 28th, February 14th); and three by Mr. Edgar Crammond on "The Economic Condition of the United Kingdom Before the War," "The Real Cost of the War," and "Economic Reconstruction" (February 18th, 25th, March 14th).

Decimal Coinage.—At a joint meeting of the Institute of Bankers, the Association of Chambers of Commerce, and the Decimal Association, unanimous agreement was assented to as to the retention of the £ sterling as the monetary unit, and its division into 1,000 parts or mils. This enables all the existing gold and silver coins down to, and including, the 6d. piece, to be retained without any alteration in their respective values. With regard to the coins of lower denomination, it was unanimously agreed that they should consist of 1, 2, 3, 1, 5 and 10-mil pieces, of which the last two would be of nickel.

This enlarged range of the coins of lower value, in addition to providing coins substantially equal in value to the existing half-penny and penny, will provide coins of intermediate value between the present halfpenny and penny, and thus overcome a defect in our present coinage, which has resulted in prices in millions of small transactions in daily life being unduly increased because of the absence of suitable intermediate coins.

New Parliamentary Bills.—Sir A. Stanley, President of the Board of Trade, is introducing three new Bills:—(1) A Bill to continue, with modifications, for a limited period after the termination of the war, certain powers in relation to imports and exports; (2) A Bill to restrict temporarily the persons who may engage in business connected with certain non-ferrous metals and metallic ores (Sir Arthur told the House of Commons that the Bill would have the effect of preventing German companies from obtaining control of metals in the United Kingdom after the war. The Dominions would deal with the matter as it affected them); (3) A new Trade Marks Bill.

With regard to (2) the *Morning Post* states that the Bill applies to zinc, copper, tin, lead, nickel, and aluminium; and is to remain in operation for five years after the war. Licences issued by the Board of Trade will be required before any person can extract, smelt, dress, refine, or deal in any way wholesale or retail with these metals or ores. Licences may be suspended or revoked, and large powers are given to the Board of Trade to call for information and to inspect documents.

Appointments Vacant.—Engineer and manager, for the Borough of Leigh electricity department; secretary (£800), for the City of Birmingham electricity supply department; instructor in electrical work (lighting and power) for the Salford War Pensions Committee; two engineers-in-charge for Worcester electricity works (£55s. and a bonus of 10s.). See our advertising pages to-day.

The Alliance of Employers and Employed.—It is announced in the Press that, in view of the success of the National Alliance of Employers and Employed since its foundation in London in December last, it is proposed to hold a meeting of leading employers and representatives of Trade Unions shortly, in connection with the Alliance, to adopt a constitution and a programme which will establish the organisation on a permanent basis and set forth its views and intentions, as a body jointly representative of Capital and Labour, in regard to the crucial industrial issues of the day. The offices of the Alliance are at 61, Victoria Street. Mr. A. H. Paterson is the secretary.

Commercial Treaties.—In the House of Commons, on Monday, the President of the Board of Trade said that the position of this country in regard to its commercial treaty engagements with foreign countries was being carefully examined by the Government with special reference to their bearing on inter-Imperial trade relations and the conservation of Empire resources after the war. The examination was still proceeding.

Allied Control of Metals.—The *Times* states that the scheme for securing the future of the mineral and metal industries of the Allied countries is gradually taking more definite shape. A French company has just been formed, entitled the Société Minerais et Métaux, with a capital of 10 million francs (£400,000), for the purpose of fostering and protecting the metal industries of France. The company, which is thoroughly representative of existing interests, will seek to improve and extend the methods of distribution, treatment, and marketing of the metals produced in France and her colonies, and will also provide financial facilities for their development. It will not be a profit-making enterprise so much as an organisation for securing the economic development and control of the country's mineral and metal industries.

Industrial Reconstruction.—In our issue of October 12th, p. 353, we gave a somewhat full abstract of the scheme of Industrial Reconstruction, for the study of which a Council is to be established. A preliminary meeting, attended by a number of the signatories to the manifesto, was held on Thursday last week at the Savoy Hotel. Sir Wilfrid Stokes, President of the British Engineers' Association, presided, and Mr. E. J. P. Bunn gave an account of the progress that had been made, and his ideas respecting the place the Council should fill. It was decided to appoint a provisional committee of five to consider the establishment and constitution of the Council. The committee consists of Sir W. Stokes, Mr. Bunn, Mr. T. B. Johnston, and Mr. J. Johnstone, and one other, and it will report to a subsequent meeting.

Problems of Reconstruction.—Speaking at the National Liberal Club last week, Dr. Addison, Minister of Reconstruction, said that no sensible man would say in what precise aspect the problems arising after the war would present themselves, but there were certain conditions which they knew certainly would exist. There would probably be a new world after the war with, perhaps, a better conception of public duty, with different conditions and new problems. It was their intention to minimise control as soon as was possible in accordance with national interests. In view of shortages of some essential commodities it would not be possible wholly to free ourselves from all those things at once. They were endeavouring to bring into their counsel experts in trade, commerce, labour, &c. The progress of this country after the war depended on the increased productivity of the nation as a whole. Unless we could produce more we should be bankrupt. The war had manifested a gigantic capacity, and he wanted to see some of that great enthusiasm projected into reconstruction. After the war the problem of material supplies would immediately become urgent. He had a strong body of experienced men working on the problem, and they were doing all they could to secure the raw materials which would be necessary. The needs of our Allies also had to be considered. Referring to demobilisation, Dr. Addison said

that a number of experienced men in the engineering trades were going into the question as to what new industries could be developed. He hoped to announce the names of the committee shortly, and it was intended that this inquiry should be the first of a series. They would also inquire in view of the coming dislocation of labour what class of labour should be employed.—*Morning Post*.

U. D. Councils' Association and Electricity Supply.

We referred in our issue of August 3rd to the resolution of the Executive Council appointing a sub-committee to consider evidence to be furnished on behalf of the Association. The sub-committee held two meetings, and requested Mr. Nicholas to give evidence on certain lines. Prior to the reference by the Executive Council it had been suggested that an engineer witness should also be appointed, and Mr. A. H. Dykes, of Messrs. Hancock, Dykes & Trotter, consulting engineers, was invited, and subsequently gave evidence before the Electric Power Supply Committee. The U.D.C. Association Sub-Committee has expressed its indebtedness both to Mr. Nicholas and Mr. Dykes for the care and attention they have given to this matter.

Electrically-Controlled Motor Boats.

The Admiralty has issued the following statement:—
“The electrically-controlled motor-boats used on the Belgian coast are twin petrol engine vessels partially closed in, and travel at a high speed. They carry a drum with between 30 and 50 miles of insulated single-core cable, through which the boat is controlled electrically. The forepart carries a considerable charge of high explosive, probably from 300 lb. to 500 lb. in weight. The method of operating is to start the engine, after which the crew leave the boat.

“A seaplane, protected by a strong fighting patrol, then accompanies the vessel at a distance of three to five miles, and signals to the shore operator the helm to give the vessel. These signals need only be ‘starboard,’ ‘port,’ or ‘steady.’ The boat is zigzagged while running; this may be either intentional or unintentional. On being steered into a ship the charge is exploded automatically.

“The device is a very old one. A boat similarly controlled was used in H.M.S. *Vernon* (the torpedo experimental ship) as far back as 1885. The only new features in the German boats are petrol engines and W/T. signals, neither of which existed then.”

Scottish Local Authorities and B. of T. Electricity Committee.

A conference of representatives of Scottish Local Authorities has been held in connection with the remit to the B.O.T. Special Committee on Electric Power Supply. Representatives were present from Glasgow, Paisley, Greenock, Kilmarnock, Ayr, Wishaw, Motherwell, Falkirk, and Stirling. After an interchange of views the conference resolved as follows:—

(1) That the conclusions of the B.O.T. Committee, so far as relating to the division of the country into areas and the establishment of large generating stations, be approved generally; (2) that, where a local authority is generating or is able and willing to generate electricity on a comprehensive system such as is recommended, the local authority should have the right to do so in preference to a joint board or a company, and be constituted the generating authority for the area in which their district is situated; (3) that the distribution be left in the hands of local authorities or existing companies; (4) that the objects outlined in the remit made to the B.O.T. Committee and in the conclusions already arrived at would appear to be attainable in large measure by the establishment of a central generating authority coupled with a scheme of linking-up, and that the trunk mains necessary in connection therewith should be put down wholly or partially at the expense of the Government; (5) that underground and overhead cables and other underground and overhead works of electricity undertakings be rated on one-fourth of the annual value thereof; (6) that the proposal to establish a Board of Electricity Commissioners is unnecessary, and that a separate department of the B.O.T., with additional powers if necessary, be constituted for dealing with electricity matters, subject to the retention of an appeal to Parliament in cases where such now exists. If such a board is constituted, it should be subject to the control of Parliament, and all existing rights of appeal should be conserved; and (7) that the existing rights of local authorities as regards overhead wires, non-interference with streets, and powers of purchase be retained, with an appeal where consent is unreasonably withheld.

Coun. J. W. Stewart and Mr. W. W. Lackie were appointed to represent the views of the conference to the B.O.T., and a committee, consisting of one representative from each of the towns invited to the conference, was appointed to go over the evidence to be submitted, and to watch further proceedings in the interests of local authorities.

At a subsequent meeting of the Glasgow Electricity Committee it was agreed to recommend the Corporation to authorise the witnesses to state that if it is ultimately determined to divide the country into areas for the purpose of generating electricity, and an area is created for Glasgow and the Clyde and places adjacent, the Corporation is prepared to become the generating authority for such area, provided the terms and conditions upon which they are required to do so will not be detrimental to the city and its existing electrical undertaking.

Inquiry.—The makers of "Uacolite" are asked for.

Volunteer Notes.—COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).—Headquarters, Balderton Street, Oxford Street, W. 1.

Orders for the week, by Lieut.-Colonel C.B. Clay, V.D., commanding:—
Officer for the Week.—Lieut. C. E. Campbell.
Next for Duty.—Lieut. W. J. A. Watkins.
Drills.—Week ending Sunday, November 25th, 1917:—
 Monday.—No. 3 Company, Left Half. Recruits, signalling, 6.30.
 Tuesday.—Physical drill and bayonet exercise, 7.30.
 Wednesday.—No. 1 Company, 6.30.
 Thursday.—No. 2 Company, 6; signalling, ambulance, 6.30.
 Friday.—No. 3 Company, Right Half. Recruits, 6.30.
 Sunday.—Commandant's Parade for heavy bridging instruction at Esher.
 Parade Waterloo Station, opposite No. 10 Platform, 8.35 a.m. Uniform, haversack, and water bottle. Mid-day rations to be carried. Compulsory for men in Sections A, B, and C.
Musketry.—Belvedere Road, Tuesday, Wednesday, and Thursday, 5.30 to 7.

(By order) MACLEOD YEARSLEY, Capt. and Adjutant.

The Whitley Report.—In the course of the debate in the House of Lords on the Marquess of Salisbury's motion respecting "Industrial Unrest," Viscount Milner, in replying, referred to the Whitley Report. He said that the establishment of Industrial Councils was by universal consent the most important point in the debate. The Whitley report reached the Government as a confidential document in March. It met with universal approval, and very high hopes were raised as to the beneficial effects that might result from the adoption of the system recommended. Its reception was encouraging beyond the highest hopes of those warmly in favour of it. Seven of the Industrial Unrest Sub-Commissions emphatically favoured it. The Trade Unions by a great majority favoured its principles; several made criticisms and reservations; hardly any were absolutely adverse. Taken as a whole, the views of the Trade Unions and of the Employers' Associations were overwhelmingly in favour of the recommendations. The Government had no longer any doubt as to what was the proper course to pursue, and they had given instructions to the Ministry of Labour to take immediate action to carry out the scheme. A new department of the Ministry of Labour was now at work trying to get Industrial Councils established as quickly as possible in the various leading industries. Certain trades were to be started with, as these, before the report was published, were making preparations for the constitution of such Councils. From these the Ministry would proceed to more difficult spheres of action, and so cover as large a portion of the field as could be covered at once, as quickly as possible. Viscount Milner said that although he was not absolutely optimistic, he thought that he could say that the new departure was the most hopeful that he could remember in the great field of social reform. The situation was full of anxiety, and the work which had been done was as nothing compared with the mountains that had to be climbed, both in the war and in peace.

Control of Tramway Labour and Material.—The Board of Trade has issued the following announcement in regard to the regulations of the supply of material, &c., for tramways:—

"In view of the difficulty in meeting the demands for various materials and labour required for the maintenance and renewal of the permanent way and rolling stock of the tramway undertakings, the Board of Trade are appointing a Committee to consider the needs of these undertakings, so that the necessary steps may be taken to supply, as far as possible, such needs, even though it may be at some temporary sacrifice to less essential undertakings."

"The Municipal Tramways Association and the Tramways and Light Railways Association are being invited to nominate members to the Committee, and the Board have asked the London County Council to allow Mr. A. L. C. Fell, the manager of their tramways, to serve on it."

"Mr. James Devonshire has been invited to be chairman of the Committee. It is not intended that the control of tramway undertakings should be interfered with by the Committee."

In the House of Commons, Sir A. Stanley said that the object of the Committee was not to take control of tramway undertakings, but to meet the needs of these undertakings engaged in work essential to the prosecution of the war.

Co-operation between Gas and Electricity.—From the Report of the National Gas Council on Coal Supplies, &c., which was recently submitted, it appears that six meetings of the "Utilisation of the Fuel Resources Committee" have been held, and a report, which it is proposed to submit to the Government, is now in preparation. It is anticipated that suggestions on the following lines will be made: (1) In the interests of national economy, the desirability of all coal of a bituminous character hitherto used directly as fuel being first treated for the extraction of its by-products. (2) Where gas undertakings are in proximity to electric power stations, an endeavour should be made to enter into an arrangement with electric undertakings for the supply of fuel for steam-raising in the form of coke or breeze. A Sub-Committee is now investigating the question of tar-burning for steam-raising.—*London and C. T. R. News.*

The Six-Hour Day. Lord Laverbuhne continues to advocate the six-hour working day in factories as a means for increasing production and providing work for all the men who return from the war. Machinery would increase production and enable higher wages to be paid. He argues for a better environment, a better outlook better education, and more leisure, out of which real culture springs. He suggests that with a six-hour day the one shift could work from 7 o'clock until 1.30 and the second could then come on, each having half-an-hour allowed for meal-times. The order of the shifts would be reversed in alternate weeks.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—The Poplar B.C. Electricity Committee recommends that in order to bring the war bonus of junior officers in the electricity department into line with the last increase granted to workmen and advances to junior officers in the works department, an additional war bonus of £10 per annum should be granted to these officers. Eleven officers will be affected, viz.: seven at £185, three at £150, and one at £120 per annum.

Derby T.C. has approved of the following increases in salaries:—Messrs. G. J. Scales and H. T. Letchford, charge engineers, from £130 to £160 per annum, and, to £170 in January, 1918; Mr. R. Littlewood, clerk, from £112 to £130 per annum; Mr. W. G. Huliston, clerk, from £108 to £125 per annum.

Mr. J. W. Lowe, senior shift engineer, Wigan Corporation electricity department, was presented with a case of cutlery on 7th inst. on his leaving to take up the post of station superintendent to the Leyland Motor Co. at the new steel works, Farington.

Mr. JOHN LAMBERT, Corporation electrical engineer, Perth, has had his salary increased by £25.

At the end of November, Mr. ARTHUR T. SMITH will be severing his connection with the Leigh Corporation electricity works, of which he has been engineer and manager, as he has accepted an appointment on the staff of the British Dyes, Ltd., Huddersfield.

General.—The King has granted the Royal authority to Sir JOHN HUNTER, K.B.E., Director of Factory Construction and Director of Iron and Steel Production; Sir LEONARD WILKINSON LLEWELYN, K.B.E., Controller of Non-Ferrous Materials Supply; and Mr. WILLIAM TURNER MACLELLAN, Officials of the Ministry of Munitions of War, to wear the Cross of Chevalier of the Legion of Honour, conferred upon them by the President of the French Republic in recognition of valuable services.

The following service appointments have been gazetted:—Fortress Electric Lights.—The undermentioned to the Second-Lieutenants on probation: Corporal James Paton, from the Royal Engineers (T.F.); Corporal Arthur Ormans Lyons, from Royal Engineers (T.F.); Sergeant Albert Seddons, from Royal Engineers (T.F.); and Staff-Sergeant J. H. Tulloch, from the Royal Engineers (T.F.). Tyne Electrical Engineers.—John R. Lang-Hyde to be Second-Lieutenant.

Glasgow T.C. has appointed the following conveners and vice-conveners:—Tramways Committee, Mr. M. W. MONTGOMERY and Mr. T. KELLY; Electricity Committee, Mr. W. H. HANNAY and Mr. P. G. STEWART respectively.

Mr. HARRISON BARRON has been elected chairman of the Birmingham Tramways Committee for the eleventh time.

Mr. H. LUTON and Mr. J. CLARK have been elected chairman and vice-chairman respectively of the Leeds Corporation Electricity Committee.

Aldermen R. A. SMITHSON and H. BROWN have been elected chairman and vice-chairman respectively of the Leeds Corporation Tramways Committee.

Roll of Honour.—Second-Lieutenant R. O. GLADSTONE, R.E., has been killed in action. At the outbreak of the war he was in Spain for the British Thomson-Houston Co., but came home and at once joined up in the ranks.

Sergeant W. J. BENNETT, R.E., killed in action, was a wireless operator with the Marconi Co.

Private N. WHITE, wounded and missing, was employed by the Automatic Telephone Co., Liverpool.

Private W. WEIR, Manchester Regiment, killed in action, was before the war in the employ of Messrs. Baxendale and Co., Ltd., Manchester.

Private H. CROWLEY, Manchester Regiment, of Spring Gardens, Barton, killed in action, was employed at the British Westinghouse Co., Ltd., Trafford Park.

Private D. GREGORY, Border Regiment, killed, was employed by Messrs. W. T. Glover & Co., Ltd., Trafford Park.

Private P. H. BOWERS, Royal Warwickshire Regiment, killed in action, was 29 years of age, and employed by the St. Helens Cable Co., Warrington.

Sapper C. VICKERS, R.E., killed in action, was an electric meter inspector for the Leeds Corporation.

Corporal W. HOLGATE, K.O.Y.L.I., killed in action, was employed by Messrs. Wright & Wood, Halifax.

Private E. KYLE, of the Loyal North Lancashire Regiment, who was wounded and taken prisoner during the Battle of the Somme last year, has written home from Germany, enclosing a photograph, and saying he is as cheerful as circumstances will permit. He thanks Messrs. Dick, Kerr and Co., Ltd., Preston, for the parcels sent during the last 12 months, all of which he has received.

Private E. STARKLY, West Yorkshire Regiment, an employé of Messrs. Messenger & Sons, Birmingham, electric lamp manufacturers, has gained the Military Medal for carrying messages continuously through heavy shell fire.

Corporal J. E. MOGG, K.O.Y.L.I., has fallen in action. He

was an employé of the Electric & Ordnance Accessories Co., Birmingham.

Gunner J. W. OSBORNE, R.F.A., of Elland, who is an electrician, has been awarded the Military Medal.

Private J. L. MILLINGS, Australian Infantry Force, who was an electrical engineer, has fallen in action.

Corporal A. G. PEARCE, R.E., formerly an overhead linesman on the Corporation tramways at Croydon, who is in hospital, has been awarded the Military Medal.

Lance-Corporal C. THAKE, R.W. Kent Regiment, who has been wounded, was on the staff of Mr. B. Powell, electrician, Tunbridge Wells.

Corporal C. H. TOMPKINS, Oxford and Bucks Light Infantry, who has died of wounds, was in the Rugby works of the B.T.H. Co.

First-Class Air Mechanic P. F. HOOKER, who joined the R.F.C. in February, 1915, whilst an electrical engineering pupil with Mr. A. T. Lambert, manager of the Maidstone Corporation tramways, has been awarded the Military Medal for bravery.

Private A. W. JACOBS, City of London Fusiliers, who has fallen in action, was an employé of Messrs. Johnson and Phillips, Ltd., of Charlton, S.E.

Sergeant H. H. J. HERITAGE, who was with Messrs. Hill, Upton & Co., electrical engineers, of Oxford, when he was mobilised as a Territorial on the outbreak of war, has been given a commission as Second-Lieutenant in the R.E.

Private F. HILDITCH, killed in action, was in the electrical department of the Potteries Electric Traction Co.

Driver G. H. MASON, R.F.A., who has fallen in action, was on the staff of the Potteries Electric Traction Co.

Obituary.—MR. J. STELL.—Mr. John Stell, of Shipley, who died last week in his 68th year, was the chairman of the Yorkshire Cable Co., Ltd., Bradford, from its inception.

MR. WOODHEAD.—The death is announced of Mr. Woodhead, rolling stock superintendent to the Walsall municipal tramways undertaking.

MR. W. DU B. DUDELL.—The funeral of the late Mr. W. du B. Duddell took place at Brighton on November 8th, in the presence of his relatives; Mr. W. M. Mordey and Mr. Roger Smith, representing the Institution of Electrical Engineers, and Prof. T. Mather, F.R.S., representing the Royal Society and the Physical Society, were also present at the ceremony.

COMMANDANT C. TISSOT.—From *La Revue Générale d'Electricité* we learn that Commandant C. Tissot, the distinguished French naval officer, Professor at the Naval School, and a noted exponent of wireless telegraphy, died on October 1st at the early age of 49. Amongst other achievements, he was one of the first to measure the current received in wireless telegraphy, and to deduce the law of range, to study the damping of antennæ and its relation to the quality of the earth-connection, and to advocate and assist in the introduction of wireless time signals, and during the war he was constantly employed upon work of national importance, in the course of which he contracted the illness which led to his untimely death.

NEW COMPANIES REGISTERED.

Rustless Iron (Cowper-Coles Process), Ltd. (148,832).—Registered November 6th. Capital, £5,500 in 3,000 7½ per cent. cum. pref. shares of £1 each, and 10,000 ord. shares of 1s. each. To carry on any business connected with the manufacture of rustless iron and other metals, and the development of processes for preventing rust and corrosion, and to carry on the business of mechanical and electrical engineers, metallurgists, chemists, &c. Agreement with Sherard Cowper-Coles. The subscribers (each with one share) are:—W. H. Essex, Haven-o'-Rest, Sunnecad Road, Sunbury-on-Thames, company secretary; H. V. Steele, 9, The Avenue, Sunbury-on-Thames, company secretary. First directors: Sherard Cowper-Coles, and others to be appointed by the subscribers.

Taylor & Co. (Hatton Garden), Ltd. (148,833).—Private company. Registered November 6th. Capital, £1,000 in £1 shares. Manufacturers of and dealers in mica, micanite, electrical plant and accessories, insulating machinery, mica chimneys, lamp tops, &c. The subscribers (each with one share) are:—Miss J. Taylor, 40, Hatton Garden, E.C.; E. W. Tester, 25, Victoria Street, S.W., stockbroker. The first directors are to be appointed by the subscribers. Solicitors: Campbell, Hooper & Todd, 30, Golden Square, W.

G. & S., Ltd. (148,816).—Private company. Registered November 5th. Capital, £1200 in £1 shares. Electrical, general, and mechanical engineers, machinists, founders, smiths, fitters, wood workers, builders, painters, japanners, enamellers, manufacturers of and dealers in motor cycles and cars, &c. Agreement with K. E. L. Guinness and C. M. Smith. The subscribers (each with one share) are:—K. E. L. Guinness, Aranmore, Kingston Hill, Surrey, engineer; C. L. Smith, Glenavon, Bedford, engineer; H. P. Hawthorn, Newlyn, Jarvis Brook, Sussex, engineering works manager; Mrs. B. Fuller, 17, Moscow Court, W. 2. The first directors are to be appointed by the subscribers. Solicitors: Mellor & Co., 8, Coleman Street, E.C.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Isle of Thanet Electric Tramways & Lighting Co., Ltd.—Agreement dated October 25th, 1917, to issue £3,000 debenture stock for a loan of £1,500. Property charged: That charged by trust deed of January, 1902, securing the company's debenture stock, viz.:—The company's undertaking and property, present and future. Holder: J. B. Glenn, Moorgate Station Chambers, E.C.

CITY NOTES.

Auckland Electric Tramways Co., Ltd.

The traffic receipts during the year ended June 30th, 1917, were £282,638, an increase of £7,911. The total revenue was £286,886. After providing for all expenses chargeable to revenue, including £20,802 for debenture and other interest, £5,101 for rental and percentage of profits payable to the Auckland City Council, and setting aside £25,000 to renewals and depreciation account, the surplus is £55,317, plus £1,601 brought forward, making £56,917. After paying the preference dividend (£9,000), putting £10,000 to reserve, and paying a total dividend of 1s. 7d. per share, less income-tax, for the year on the ordinary shares, £5,292 is to be carried forward. During the year £8,186 first mortgage debenture stock was bought and cancelled at an average cost of 93½ per cent. No further capital was issued. The capital expended was £9,546, chiefly for the Upper Queen Street extension, which was opened in October of last year. The route miles open are 27.13, as against 26.59. The passengers carried were 13,351,632, against 12,352,531. Average receipts per passenger 1.57d., against 1.56d. Average expenditure per passenger 1.00d., against 99d.

Drake and Gorham, Ltd.

In his speech at the annual meeting held last week, Mr. B. DRAKE said that the year's profit of £11,395 compared with £8,527 for the preceding year, and constituted a record since 1903. Although, as in most British electrical concerns, their dividends paid in the past had not been such as an investor expected from an industrial enterprise, yet the amounts earned had now exceeded the capital of the company. The assets had been increased by over £35,000, and about £93,000 had been distributed in dividends. By adopting a conservative policy in the matter of distribution they had been able to enter new fields without having to raise additional capital, which would have been difficult to obtain. It was fortunate that the board decided in the past not to rely solely on country-house lighting, with which the name of the company was originally connected, for, in spite of the practical suspension of this class of work, they had been able by manufacturing and wholesale trade, coupled with contracting for the equipment of war factories, camps, aerodromes, &c., to reach a turnover considerably in excess of what was previously found possible. There was little doubt that the supply of electrical power to factories, in which direction the company had acquired considerable experience, would after the war become a more valuable branch of their business. The power station erected by the company for a leading chemical company had for some time been working night and day, and had given satisfaction. Negotiations were in progress for similar work on a larger scale. The Manchester branch had done well in all departments, and again showed increased profits. The electric vehicle business, as might be expected, had increased, and there was no doubt that the results obtained would ensure a continuance of this method of propulsion even when petrol was again available at reasonable prices. As the lease of the present warehouse and works was expiring, and it was evident that the turnover warranted larger premises, they had taken the Rockingham Works, Newington, on lease. It had been difficult to decide on the size of works which they were justified in acquiring, owing to the absence of any declaration on the part of the Government as to their after-war policy. Manifestly, if the pre-war dumping was again to be permitted, and the electrical industry was not to be fostered more than in the past, the manufacture of electrical goods would again show poor returns on capital invested. In view of the uncertainty, they had not felt it wise at present to extend their manufacturing on the scale that they would have wished. They, however, anticipated that in any event the wholesale merchanting branch at home and overseas would expand, and they were negotiating for a warehouse which should meet their needs for many years. They had a good list of orders for the first quarter of the current year, and were constantly receiving repeat orders, but if the war continued it was impossible to foretell what results they might be able to show in the next balance-sheet.

Western Telegraph Co., Ltd.—The company has now issued its report for the year ended June 30th. The revenue was £1,073,206, and the working expenses were £397,591. After providing £32,747 for debenture interest, and £149,226 for income-tax and excess profits duty, the balance is £493,432, plus £38,345 brought forward. There has been transferred in further reduction of the amount of capital expenditure in excess of the share capital and debenture stock issued £150,000, to general reserve £100,000, to land and buildings depreciation fund £30,000, and to maintenance ships reserve fund £50,000. The total distributions for the year have amounted to 8 per cent., free of tax, leaving £35,433 to carry forward.

Stothert & Pitt, Ltd.—Dividend of 10 per cent. and a bonus of 2½ per cent., free of tax, on the ordinary shares. £5,000 is put to reserve, and £12,998 to the extinction of goodwill account.

Quebec Railway, Light, Heat & Power Co., Ltd.—At the annual meeting, held in Montreal on October 11th, it was reported that the gross earning for the year ended June, 1917, were \$1,832,032, an increase of \$100,299. Miscellaneous income was \$230,851, and the increase from all sources was \$91,281. Operating and maintenance expenses at \$1,155,909 showed an increase of \$126,218. The net surplus is \$200,587. The properties had been kept in a high state of efficiency, \$226,366 having been expended during the year on maintenance accounts. The capital expended during the year was \$302,661. Mr. H. G. Matthews, the general manager, died in July, and Mr. W. J. Lynch, treasurer and comptroller, had been appointed to his post. The Hon. R. Mackay, a director since the organisation of the company, died in December.

Nairobi Electric Power & Lighting Co., Ltd.—The accounts for 1916, the publication of which has been delayed by war conditions, shows that the units generated were 1,495,281, as against 1,122,744 for 1915; motors connected, B.H.P. 648, against 431 in 1915; lights connected (40 watts) 9,811, against 8,044 in 1915. The auxiliary steam plant erected at Nairobi was used to the extent of rather more than 10 per cent. of the total units generated. The share capital is £32,950 issued, a slight increase. The preference and ordinary shares have been consolidated into shares of one class only. The war occasions increasing difficulties in carrying on the company's operations. Further developments are nearly stopped on account of the impossibility of procuring the necessary plant and materials at Nairobi. A final dividend of 4 per cent., making the total 10 per cent. for the year, less income-tax, on all shares, is to be paid.

Trafford Park Estates, Ltd.—For the year ended June, 1917, the profit was £35,526, plus £50,352 brought forward. A dividend of 5 per cent. is recommended, carrying forward £54,766.

United Electric Tramways of Caracas, Ltd.—A dividend of 7 per cent., less income-tax, for the year is to be paid, carrying £1,899 forward.

STOCKS AND SHARES.

TUESDAY EVENING.

Stock Exchange markets are in quiet mood. Russia and Italy are uncomfortable factors. From the merely financial point of view, Russia is, for practical purposes, written off for the time being, but it is hoped that the Italian prospect may any day take a sharp turn for the better. Money goes steadily into the new War Bonds; subscriptions, however, are less than they ought to be, and it would appear as though capital were being accumulated in deposit and other accounts. Still, the applications do make a difference to the volume of investment business which might otherwise be flowing into Stock Exchange markets.

While Home Railway stocks are letter as a whole, the Underground list is dull and heavy. Income Bonds further gave way, and the shilling shares went back to 6s. Metropolitan Consolidated rallied after being weak at 22½.

The most active part of the electrical markets is that concerned with the manufacturing shares. Comparatively speaking, there is a lot of business doing in Edison Swan shares, which stand at the good price of 26s. 6d., while the fully-paid hold their rise at 21. Cromptons, too, are strong at 13s. 6d., with a good demand for them, and the preference are 15s. General Electrics hold their big rise, the ordinary at 18½, while the preference are 10½, and there would be much more doing in them were there sufficient supply of shares to render the market liquid. British Aluminiums reacted a shade to 32s. The little rise in Aron ordinary brought in a few sellers, and the price has gone back a trifle to 2s. 3d. There still seems to be an expectation, rather than a hope, that some kind of amalgamation or agreement of interests will be arrived at between various manufacturing interests, and to the expectation is added the hint that the United States manufacturers may also come into the business, but we have failed to find any justification beyond rumour only.

The foreign division is dull, with the exception of Brazil Traction. The latter have recovered a point to 43, and are a better market than they have been lately. British Columbia Deferred at 28 is ½ better, and the 1½ per cent. debenture stock retains its recovery of 4 points. Mexican Light and Common first bonds went back to 42, a drop of 3 points, most Mexican issues being weak. There is no change in the Argentine list. It is worth observing that Indian shares are in some request. Bombay Electric preference moved up to 9½. Madras preference are wanted about 4½; the last business recorded in the shares was at 1½ in the middle of July. Calcutta Trams changed hands the other day at 6 13/16; the price of the preference is £1, and the 4½ per cent. debenture stock has lately hardened to 74. There is a little business passing, too, in British Electric Traction, the ordinary being easier at 31½, the 6 per cent. participating preference stock 71, while the first and second debentures are 71 and 65 respectively. La Plata Tramways ordinary were done the other day at 2s. 4½d., and the preference stand about 6s. 3d. Lon-

don United Tramways debenture is unchanged at 35½, on the company's publication of its intention to apply for Parliamentary permission to re-arrange its fares. Cape Electric Trams are lower at 11s. 3d.

The telegraph market is quiet. Anglo-American preferred fell a point to 97, but the Eastern group keeps its prices, and Westerns in particular are strong at 15½. Oriental Telephones went back to 3. Marconis have undergone a change for the better, the parent shares hardening to 3½, while the Marines maintain their position as the firmest of the group at 2 21/32. The speculation in American Marconi and in Canadians has died out for the time being. The prices of the two are respectively 21s. 6d. and 10s. 6d.

City of London ordinary shares are ½ better at 13½, this being the only change in the lighting list on the week. Dealers in the market report that there is still a strong demand for the best class shares, of which the scarcity is almost as marked as that of tea, butter, and sugar, while it is almost impossible to obtain debenture stocks. Activity in the manufacturing list makes up a good deal for the quietude of business in the supply shares, and one hears an occasional wish that certain companies would follow the example set in other directions, and split their shares into smaller denominations in order to render the market in them more liquid. Of this, however, there is no indication at present, nor does it seem to be at all likely that such a course would be pursued.

The Rubber share market is quiet, and inclined to go lower in company with the price of the raw article. Provincial buyers show a mild disposition to pick up tin and copper shares, and the armament group is a little better. Taken all round, however, Stock Exchange business is quiet; the War Loan and industrials make the best showing.

DOMESTIC ELECTRIC HEATING PROBLEMS.

Water Heating.—At the Joint Convention of the North-West Electric Light and Power Association and Washington Contractors' Association, held recently, a whole day was given to the discussion of electric range and water heating problems. Electric water heating is a live problem in America, and, judging by one of the papers quoted in the *Journal of Electricity*, some sort of agreement as to general practice has been achieved. It is pointed out that an automatic circulation gives the best service, consumption averaging 3 to 4 KW.-hour per day per person, which, at 1 cent per KW.-hour, is satisfactory to the average consumer.

The efficiency depends on the installation as a whole, and, for average conditions, is assumed to be 85 per cent.

The needs of the average small family of three or four persons can be satisfactorily met by a 30-gallon boiler and 2-KW. thermally controlled heater of the circulation type, while larger families of six or eight persons would use a 3 or 4-KW. heater of the same type.

Fig. 1 shows the method of installation recommended, and fig. 2 the thermal switch or automatic cut-off. The bottom of the heater should be as low as, or lower than, the bottom of the boiler, to ensure circulation and the operation of the thermal switch. The heater should take cold water from the bottom of the boiler, and

FIG. 1.—AUTOMATIC CIRCULATION-TYPE WATER HEATER.

deliver hot water to the top: cocks are fitted above and below the boiler to enable the heater to be removed without drawing off the water, but the upper cock is also used to restrict water circulation, in order to give a greater heating effect in the circulator. Three makes of heaters are fitted with restricted openings for this purpose, but the use of cocks is advised in any case.

The cocks should be adjusted so that the heater delivers water at 160-175° F.: the lower cock corrects the tendency of cold water in the bottom of the boiler to by-pass through the heater to the top of the boiler when hot water is being withdrawn. The heater and pipes should be insulated with magnesia or similar covering 1 in. thick.

The thermal switch is stated to be simple and reliable, and easily installed in the pipe below any standard circulation heater, the switch being sold for from \$7 to \$8.

The thermally-controlled immersion heater can be used instead of the circulation type, and being within the boiler, will decrease radiation losses, though it should be used with an ample-capacity boiler, so that there is always a sufficient quantity of hot water left at the top to meet demands while the remainder of the water is being heated up.

This heater has the characteristic of mixing the water and raising the temperature of practically the entire boiler at the same time.

Where the rate is considered too high, or it is unnecessary to maintain a hot water supply at all times, a non-automatic circulation heater of 1 or 5-KW. capacity can be used on a double-throw switch with the range, and a lower energy consumption will result by reason of the lower radiation losses, &c.

Non-automatic immersion heaters of small capacity have been used in considerable numbers in the North-West, but suffer from the same disadvantages as the automatic-immersion type.

The instantaneous type of heater without coils or switch, and

FIG. 2.—THERMAL SWITCH FOR ELECTRIC WATER HEATER.

having the current-limiting feature, is regarded as the most efficient and inexpensive where a limited quantity of water is required.

In the favoured design the electrodes consist of a tube within a cylinder: the water is slowly admitted from the bottom, and gradually rises, filling the electrode space, the current correspondingly rising from zero to maximum, and the reverse action occurs when the water is turned off and the heater drained. The heater has therefore no detrimental effect on the regulation of the circuit. Heaters of this type of about 5-KW. capacity can be installed on double-throw switches with ranges, and will produce limited quantities of boiling water at a very low cost.

Nine of the companies in the North-West have installed a total

FIG. 3.—INSTANTANEOUS TYPE ELECTRIC HEATER SHOWING PARTS.

of 1,930 water heaters, with a connected load of 3,560 KW.: a thousand of these are on one system.

Feeder Diversity of Electric Ranges.—A paper on this subject dealt with the effect of the electric range load on a lighting feeder, as the immediate question is that of supplementing feeder capacity where the range is threatening to establish a peak.

To observe the effect of the ranges, observations were taken during two weeks on six feeders in both winter and summer: each feeder was rated at 100 amperes at 2,300 volts, single phase. The results were as follows:—

Ranges	13	39	13	21	11	6
Load factor (winter) ...	106	37.1	35.8	38.5	36.8	37.9	
Ranges	13	53	17	25	17	6
Load factor (summer) ...	33.4	43.7	34.1	27.9	30.7	28.3	

It is noted that feeders with a small number of ranges show decreasing load factors as summer approaches, while feeders with a large number of ranges show increasing load factors, the only exception being a feeder with a summer amusement park on it. In order to get more accurate information, one feeder with considerable range load was further tested; this supplied small frame houses, a few large houses, and one apartment house, the

sumers being office and professional men. The following data was obtained :

Total number of residences	643
Total number of electric ranges... ..	53
Total capacity connected in ranges	303.3 KW.
Total number of electric water heaters	29
Total capacity, electric water heaters	21.65 KW.
Total number of transformers	44
Total capacity, transformers	437.5 K.V.A.

Daily Load Data.		Average.	Maximum.
		K.V.A.	K.V.A.
Sunday	59.0	109.7
Monday	62.2	91.7
Tuesday	69.3	107.0
Wednesday	68.4	107.5
Thursday	61.8	97.3
Friday	63.7	111.2
Saturday...	66.3	112.0

Average, 61.1.

Weekly apparent load factor, 57.5 per cent.

From the load curves obtained, it is noted that there is a night load of over 10 K.V.A. on every night, accounted for as to half by water heating and the remainder by all night lighting, and feeder, transformer, and meter losses.

Deducting the 20 K.V.A. with an additional 20 K.V.A. for lighting from the largest range peak (as shown by load curves), 107 K.V.A., there is a net range peak of 67.5 K.V.A. at 6 p.m. on the Wednesday, which, compared with the connected load of 303.2 K.V.A. in range capacity, gives a demand factor of 1.5.

Looking to the future, it is considered that the area served by this feeder will have six times as many ranges—i.e., 318 of 1,820 K.V.A. rating. If this were handled by six feeders of present capacity it is clear that their characteristics would be similar to the present one, with the exception that the lighting and ironing peaks would be 1.6 times as large as at present. The winter peak for the feeder was 193.2 K.V.A. with 39 ranges, which, with a 3.9 demand factor, would give a maximum range load of 60 K.V.A., leaving 133.2 K.V.A. for lighting and losses.

Taking one-sixth of this, there would be a lighting and loss load of 22.2 K.V.A. plus a 67.5 K.V.A. peak due to ranges, giving a total maximum demand of only 89.7 K.V.A., or less than half the capacity of the feeder.

Even allowing one-third of the district to a feeder, in which case there would be a lighting and losses load of 44.4 K.V.A. plus 129.1 K.V.A. (for 106 ranges of 607 K.V.A. rating with a demand factor of 4.7), the load of 173.5 K.V.A. is within the capacity of the feeder.

Further, assuming the case of only one additional feeder, lighting and losses would account for 66.6 K.V.A., which, with 159 ranges of 910 K.V.A. capacity and demand factor 5.2, would only give a maximum load of 241.6 K.V.A., which a slightly larger feeder could handle.

The author, therefore, comes to the conclusion, that on present admittedly inaccurate data, so far as feeders are concerned, the excellent diversity of the electric range will make it possible to handle very considerable loads with only slight increases in feeder investment.

(To be concluded.)

THE INSTITUTION OF ELECTRICAL ENGINEERS.

*Abstract of the Inaugural Address delivered by
MR. C. H. WORDINGHAM, President, November 8th, 1917.*

THE INSTITUTION AS NOW CONSTITUTED.

I PROPOSE to take for the main subject of my address this evening the Institution itself; to consider how far it meets the needs of the profession and industry, and what improvements can be made under its existing constitution; then to inquire whether it may not be possible to raise it to a far higher plane and make it much more potent in the development of electrical engineering. The Institution and the industry should be one, and if they are not, it is our business to make them so.

I have seen from time to time, with great regret, indications that many members are not wholly satisfied with the management of the Institution, and have heard expressions of opinion that it does not sufficiently represent the industry or look after its interests adequately.

These allegations are, in many instances, based upon ignorance of what the Council is doing, but more largely upon a want of appreciation of what it is possible for the Council to do. The Institution comprises in its members every electrical interest in the country; those interests are heterogeneous, and in many cases the interests of one section of the members directly conflict with those of another section. How, then, is it possible for the Council, in the name of the Institution as a whole, to represent adequately the material interests of one particular section without doing an injustice to another section? I have always held the view that the Institution should attend to the promotion of electrical science and its applications to engineering; it should promote research of

every kind; it should encourage the spread of scientific knowledge and the improvement of engineering practice; it should set the highest possible standard of conduct and of attainment in knowledge and skill among its members, but it should not attempt to look after the commercial interests of any one section. It is often stated, in a somewhat sneering manner, that the Institution will not demean itself by looking after such sordid considerations as those involved in commercial pursuits, though its members, one and all, have necessarily to pocket their profits if traders, or their fees if consultants.

No greater misrepresentation of the attitude of mind of those who see the limitations I have indicated could be made. The reason that I contend the Institution should not attempt to interfere with commercial matters is that it is impossible for it to do so efficiently. It is of the essence of the successful prosecution of commercial interests that those interests should be common and homogeneous, and I have always held most strongly that each section should organise its own association for the promotion of such interests so as to bring the greatest possible weight to bear by concentrating the whole action in one direction. This course was followed at an early stage by municipal engineers who formed the Incorporated Municipal Electrical Association. Much later there has been formed the British Electrical and Allied Manufacturers' Association to look after the manufacturing interests. Other associations have been created for other interests which I need not enumerate. There can be no question whatever of the value that the two Associations I have particularised have been to the interests concerned, and this work has been accomplished simply and solely because each has been homogeneous and has only sought to serve the interests of the particular group of individuals affected. If each section is thus benefited, it necessarily follows that the industry as a whole is advanced.

I believe also that much apprehension arises from the fact that the proceedings of the Council are secret. Representations have been made from time to time to the effect that some account of each Council meeting should be communicated to members through the *Journal*, and an attempt has been made to publish those portions of the Council minutes which it has been thought might be communicated without detriment. I am afraid it is impossible effectually to meet this demand. Much of the matter which comes before the Council is of necessity confidential, and negotiations and communications take place which it would be impossible to publish without causing much mischief and defeating the objects in view. In my view the only possible course is for members to trust those of their number whom they have elected to the Council, and to believe that they are doing their best to ensure the good of the Institution and watch over the interests of its members.

It is an unfortunate fact that a very large number of members abstain from voting at the Council elections. The normal proportion of votes recorded to voting papers sent out is about 25 per cent. Obviously, if members will not take the trouble to secure the return of members in whom they have confidence, it does not lie with them to find fault later with the Council. Personally, I am very fully impressed with the need for a thoroughly representative Council, and I should like to see some change made in the mode of its election which would ensure that each section of the members was directly represented thereon in proportion to the numbers in that section. For example, I should like to see the important groups, such as the telegraph and telephone members, the manufacturing members, the municipal members, the company supply members, and so on, each vote for their own representative or representatives, thus ensuring that those representing a specific interest were chosen by the whole body of members devoted to that interest. In addition, I would have a certain number elected by the whole body of members independently of any group representation. There would undoubtedly be difficulties in the way of such a modification in existing practice, and the matter cannot be discussed adequately outside the Council, but I hope that when the next revision of the Articles takes place this matter may be given very full consideration with a view to making the Council as representative as possible in every way.

Yet another matter which calls for attention is the undoubted feeling that London members have a decided advantage over those living outside London and abroad. Not only are they thought to get more than the other members, but in some quarters there is an idea that there is a tendency for them to run the Institution. Every effort has been made by the Council in the past to remove any possible grounds for this feeling. The creation of the Local Sections, their representation on the Council, and the weight given to all suggestions received from such Sections have gone far to bring members outside London into full touch with the conduct of the Institution. The meetings held locally afford the same opportunities to members of meeting one another and of discussing Institution papers as are enjoyed by the London members; important papers read in London are read also at these meetings, in addition to local papers, and there is considerable activity locally, stronger it is true in some districts than in others. The introduction of proxy voting, decided on last session, goes far also to put all members on an equal footing, independently of geographical position.

It is of the utmost importance to the well-being of the Institution that any feeling of the kind I have mentioned should be wiped out. I think it would be desirable occasionally to hold a full meeting with President and Council in some of the more important centres, such as Manchester, Leeds, Birmingham, Newcastle, and possibly Glasgow. Not only would such a course quicken the interest of the members resident in the district, but it would serve the independent purpose of making the Institution better known to those outside the profession.

Turning now to London itself, we may well inquire whether the Institution is doing all that it can for the advancement of its legitimate objects. Many members think that it is not, and I am afraid there is some ground for their doubts. This year we are peculiarly handicapped through the commandeering of our building by the Government. I have often felt that the large sums of money invested in the fine building that we possess on the Embankment have not brought in the return in usefulness that they should. The load factor of the building is painfully low. It is true that the lecture theatre is often lent to other societies, but how often is it filled by the members of the Institution? For what proportion of the members is the common room a place of rendezvous? And how many members ever enter the library or avail themselves of the magnificent collection of books therein? When one sees the extraordinary success of such an institution as the Manchester Engineers' Club in bringing together so many different kinds of people interested in engineering and in initiating useful schemes for the good of the industry, one cannot help asking oneself why it is that something of the sort cannot be done, and done on a far larger scale by the Institution. It is true that Manchester is an altogether exceptional centre, but there is a great number of electrical engineers within a very moderate radius of Charing Cross, and if only the right scheme could be hit upon I am convinced that the Institution could be made an active centre of everything electrical. Even country members are often in London, and they would soon flock to the Institution if they knew they would meet there the men they want to see.

There seems to be something about the ordinary formal meetings which is found to be forbidding in some ways to many members, more especially to the younger ones, and there is a want of the sociability and willingness to take part in the discussions which one finds in most of the local centres. Now that meetings have to be held at 6 p.m., I should like to see arrangements made for the meeting to be followed by an inexpensive dinner. This would suit the convenience of many members living out of town, and it would unquestionably promote acquaintanceship between members and greater familiarity among them.

Then, again, I think short informal meetings, at which points of difficulty or special and immediate interest could be discussed in a more or less conversational manner, would be of great utility. Such meetings would encourage the younger members to come forward. Many who, though possessing valuable knowledge and ideas, are too diffident to write papers or join in formal discussions, would take part in proceedings of this kind, and while adding to the usefulness of the meeting would be encouraged, once the ice were broken, to join in the ordinary meetings. I am confident that the progress of the Institution will be greatly helped by interesting the younger members in its doings, and every possible means should be taken to effect this end.

It would be of extreme value if the Institution were to arrange for a series of lectures on special subjects by experts in those subjects setting forth what has been accomplished in the particular branch concerned, and giving a general idea of the present position of knowledge. For example, electric furnaces have developed to an extraordinary extent during the last few years; electrical theory has undergone many modifications and much development; a practically new field in electrical cultivation is being opened up, and many other examples will suggest themselves.

Again, I should like to see something done with a view to interesting the enormous army of men not qualified to become members in any grade of the Institution, but on whom much of the welfare of the industry depends. I refer to the workmen class. It should be possible to awaken in these men, many of whom are exceedingly intelligent, a desire for a better knowledge of the principles underlying their work. We have seen attempts made by individual firms to promote such interest by the holding of examinations and the offering of prizes; surely if an individual firm can create interest in this manner, is should be possible for the Institution to do far better. The opportunity could be utilised for educating workmen also in the economic questions which are vital to the success of the industry.

The Institution might with advantage come out of its shell and cater for the education of the general public in electrical matters. Popular lectures on the lines so successfully followed by the Society of Arts and the Royal Institution would do much to spread an elementary knowledge of electrical subjects, and to make the public realise the advantages of electrical appliances. Lectures which gave solid facts to individuals of ordinary common sense would, I believe, do far more to promote the objects sought by so-called "publicity campaigns" than any amount of exaggerated state-

ments, or of posters and illustrations, imagined by their authors to be humorous or arresting.

This branch of the work might be supplemented by a carefully organised permanent exhibition of electrical appliances, these being constantly changed, and demonstrations of new apparatus arranged for. It ought to be a well-understood thing that if any new useful electrical invention is brought out it can be seen at the Institution as a matter of course, and an explanation of its action be forthcoming.

From time to time conversaziones might be held on the lines of those given by the Royal Society for many years past. At these, members would bring forward their latest achievements and give demonstrations of their discoveries.

Such a programme would involve an enormous amount of work, but the Institution can only effect useful results by work, and unless we put the energy in we shall most certainly fail to get anything out.

Much more ought to be done in the direction of research. A useful beginning has been made, but there is a practically limitless field to be covered. Speaking from a very intimate experience of the work, I am of opinion that it cannot be looked after adequately if it be dependent solely upon the efforts of overworked members of Council, who can only give portions of their time spasmodically to the work. The Institution ought to have one or more well-paid men of the highest scientific attainments to look after technical questions such as research, and the organisation of the various fields of activity which I have indicated.

THE INSTITUTION RECONSTITUTED.

I have spoken so far of what might be done by the Institution under its existing constitution, but it is seriously and unnecessarily handicapped by being constituted under the Companies' Acts. I am ambitious for the Institution; I want to see it occupying its proper place in the life of the nation and in the enjoyment of a Royal Charter, which shall confer on it those powers which alone can enable it to take effectual action for the good of its members and of the general public whom they serve.

It is a matter of common knowledge that the electrical industry has suffered severely in the past from ill-advised legislation, but it is not, perhaps, so widely recognised that it has been seriously hampered by the absence of mandatory powers appertaining to any body within the profession. The feeling is widespread that compliance with some standard of education, training, and experience should be enforced before a man is allowed to call himself an electrical engineer, and that adherence to certain standards of professional conduct should be a necessary condition of his continuing to practise; at present anyone can call himself an electrical engineer, and no one has the right to object.

The position in regard to the promulgation of rules regulating electrical practice in essential particulars is most unsatisfactory. The Institution has drawn up such rules, but can give them no mandatory force, with the result that those contractors who recognise their necessity and value, and who wish to support the Institution loyally, are placed at a serious and unfair disadvantage in competing with less scrupulous firms who flout the rules, knowing that they can do so with impunity. Bad work is thus put in to the detriment alike of the sound contractor and the public, while the reputation of the industry suffers and its progress is retarded.

Most engineers are agreed as to the imperative necessity of standardising practice in regard to manufacture, both as regards the rating of machinery and the interchangeability of parts of articles in common use, but although an immense amount of work has been done in preparing such standards, no power whatever exists to enforce them, and in the absence of compulsion, which would put all manufacturers on an equal footing, firms who would gladly comply with the requirements hesitate to incur the expenditure necessary to bring their practice into line with them, while others, taking a narrow and short-sighted view, deliberately refuse to adopt them. The result is that the cost of manufacture is unnecessarily high, and users suffer inconvenience from the diversity of practice, the spread of the use of electrical appliances being retarded in consequence.

The absence of any authority which has the power to say whether a given article conforms with certain regulations or standards, or attains some specified degree of excellence, is a serious impediment to trade, especially to British trade abroad, which is perhaps somewhat imperfectly realised. I shall enlarge on this later.

The medical and legal professions already have the power to regulate the admission of new members to their ranks, and to expel those unworthy to continue in them, and there can be no inherent reason why the engineers, on whom depend the lives of countless thousands of the general public, should be denied similar powers.

I am aware that there are serious difficulties in giving effect to the views I have enunciated. In the first place, electrical engineers, though they touch at one point or another the work of almost every other class of engineer, are but one of several important groups. It is difficult for one section of engineers to obtain powers not sought by other sections, and unquestionably our efforts ought first to be devoted to carrying with us those other bodies, such as the Institution of Mechanical Engineers, the Institution of Naval Architects,

and more especially that mother of institutions, the Institution of Civil Engineers, to which we, as an Institution, owe so much. If our efforts to promote this joint action fail, then we must still try what we can do on our own account, but concerted action must unquestionably give the best results. Engineering in the widest sense would then be placed on the same footing as other professions, and be similarly recognised by Government. The powers and privileges granted would be delegated to, and exercised by, the several Institutions for the branches which they respectively represent.

Electrical differs from all other kinds of engineering in the extraordinary variety of the operations included in the general term. We have professional men, large manufacturing firms, municipal engineers, manufacturers of heavy plant, makers of telegraphic and telephone apparatus and instrument makers, electrochemists and makers of batteries. New branches of work are daily opening up, such as electric furnaces which trench on the great steel industry, and electro-culture, at which point we touch farming.

No other Institution has so many and such varied interests to represent, nor has any other profession need for anything approaching the elasticity as to the qualifications to be demanded of those entering its ranks as our own. It is for these reasons, probably, in large measure that the present unsatisfactory state of affairs has arisen, but the difficulty of the problem only makes its solution the more imperative.

Owing to the importance of certain sections, influential bodies outside the Institution have grown up. It is eminently right and proper that they should be formed to look after those members who have common material interests. It is, however, equally important that there should be no overlapping, and that they should confine themselves to those branches of work which the Institution cannot do so efficiently as they. I deprecate most strongly anything in the nature of rivalry. The ideal that I look forward to is a strong Institution, endowed with a Royal Charter, recognised as the embodiment of the whole industry as far as those outside it are concerned, invested with full powers as to the educational qualifications to be possessed by all grades of workers in the profession and industry from the highest to the lowest, and effecting under its aegis the federation of all other associations connected with the multifarious branches of electrical work.

We cannot expect more than one body to be recognised by the Government and the public as standing for the electrical industry, and it is vital to all concerned that such recognition should be bestowed on an association that is truly representative of the entire industry, and that has the maximum weight of authority and numbers behind it; this the Institution would possess if constituted and worked on the lines I have indicated.

A beginning should be made at once, and I see no reason, if all will pull whole-heartedly and loyally together, why the ideal should not be realised. Most of the members of other electrical associations are already members of our Institution, many of them active ones, and if they were satisfied that we were in a position authoritatively and effectually to help their respective organisations there can be little doubt that they would support the federation I suggest, and work unreservedly to assure the Institution occupying the leading position that it should, sinking all rivalry if such rivalry exists.

Broadly, my view is that each section should have its own association to look after its commercial interests, such associations being formed if not already existent for a particular branch, and that each should be represented directly in appropriate proportions on the Institution's Governing Body. The Institution to be given a definite status by the Government, and recognised as the only body representing electrical engineering; the Institution to control entry into the profession, and all regulations on electrical matters to be issued at its instigation, or in accordance with its advice. Grants in aid of research or other national purposes to be entrusted to the Institution for administration.

It may be argued that the Institution, even though modified in its constitution in the manner suggested, would still have the difficulties I emphasised earlier in my address in regard to the discordant commercial interests of different sections of its members. To some extent this is probably true, but its authoritative position would enable it to compose many differences which it is now powerless to influence, and in very few cases would it be found necessary for any special Association to take independent action; but in the last resort this could be allowed without detriment to the scheme.

(To be continued.)

The Metric System.—The Education Committee of the London County Council has had under consideration the following resolution passed by the Central Consultative Committee of Head Masters: "That the time is now ripe for the compulsory introduction of the metric system," and recommends "That the Council is of opinion, on educational grounds, that the time has arrived for the compulsory introduction of the metric system, and that a communication to this effect be conveyed to H.M. Government."

SALARIES AND WAGES IN ELECTRICITY SUPPLY.

It is common with the rest of humanity, the central-station man, whether he claim the title of "engineer" or that of "employé," is subject to the great primal law of Nature—the law of self-preservation. He may have no undue craving for gold and silver; in normal times he may even be fairly content with his lot (though we have grave doubts with regard to such a phenomenon); but the fact remains that, as society is organised, an adequate supply of money is essential to his existence, not by virtue of its own intrinsic properties, but because it enables him to satisfy his physical needs. If in time of peace he had barely sufficient money to cover his requirements, it is clear that when the purchasing power of money has fallen by 50 per cent. he has an unquestionable right to a substantial increase in the nominal value of his payment, in order to bring its actual value up to a reasonable amount.

The fact is recognised by the Government, which has intervened in many industries of national importance at the instance of the Trade Unions concerned and awarded to the workers increased wages; in other cases the Trade Unions, without Government aid, have obtained advances for their members; but in the case of electricity supply the conditions are altogether exceptional, for there exists no body which can fairly claim to be representative of the whole of the interests concerned, and to be authorised to act on their behalf. Moreover, the gradation of rank in electricity supply from operative to executive and administrative posts is so gradual and continuous that, while it is impossible to bring all the members together in one society, it is exceedingly difficult to find a line of demarcation. Hence it is that a conflict, or at least a competition, has arisen between two societies, the Association of Electrical Station Engineers and the Electrical Trades Union, each of which claims the right to represent the central-station man and to act on his behalf. During recent weeks we have allowed both parties to set forth their claims and views in our "Correspondence" columns, in order that readers may be enabled to appraise their respective merits and capabilities, and in the hope that eventually means may be found to reconcile their differences and arrive at a satisfactory solution of the problem—the essence of which, as stated above, is to improve the conditions obtaining in the service of electricity supply.

In this issue will be found the report of a meeting of senior technical officers, and a letter from a "Chief Assistant," which, in our opinion, indicates that the solution is near at hand. We commend them both to the attention of readers interested in this subject, and we set forth below our own views on the matter.

In the first place, we regard the settlement of this

question as a matter of urgent importance; controversy is out of place—co-operation and agreement are essential, and some sacrifice of individual predilections is therefore indispensable, lest all should suffer. Secondly, we hold that no one society can possibly answer all the requirements. From the very commencement, the Association of Electrical Station Engineers has been handicapped by the existence of two parties within its ranks, with essentially different views and policies, and while this condition obtains it cannot possibly attain its aims. Reconstitution appears to be the only course that affords any prospect of success, and for this reason we welcome the movement that was set on foot at the meeting of senior technical officials of the London area at Hammersmith last week. The instruction to the Provisional Committee to invite the chief engineers of London undertakings to appoint representatives to meet the committee is particularly commendable; their assistance and support are indispensable to the attainment of the desired result.

In this connection, the suggestion of "Chief Assistant" is interesting—namely, that the chiefs themselves should take action towards forming a comprehensive association embracing all professional electricity supply engineers, whether attached to company or municipal undertakings, throughout the country, for the express purpose of promoting the interests of the members in all degrees. Mr. Wordingham, in his presidential address, pointed out the advantages derived from the formation of such associations, and would no doubt support the movement. The Institution of Electrical Engineers obviously will take no action tending towards the desired result; it rests, therefore, with the central-station men themselves to act. Their cause is undoubtedly just, their grievances are clamant, and they urgently need a representative body to look after their interests.

So far we have only incidentally referred to the non-professional employés, the reason being that they are in far better case than the professional men. Their needs and methods differ from those of the professional engineers; they prefer trade-union methods, and already several such unions exist for membership of which they are eligible, and which would welcome them. *Chacun à son goût*; those who fall within the "No Man's Land," as "Chief Assistant" suggests, could join which and which would welcome them.

There is undoubtedly room in central-station service for both types of society, and there should be no question of rivalry, still less of friction, between them. It is true that there exists as sort of "No Man's Land" to which both sides may lay claim with more or less justification, but, as "Chief Assistant" remarks, it should be possible to arrive at an agreement on this point, based upon definite qualifications.

The standing of any such society, be it an association of engineers or a trade union, is necessarily dependent in a very large measure upon the character and ability of its individual members, and we would earnestly commend this fact to the attention of the organisers; if they desire to secure for their society an unblemished reputation, it is essential that they shall specify appropriate standards of education, character, and technical attainments which must be complied with by all aspirants to membership. If they open the door too widely to all comers, seeking only to increase their numbers and their income from subscriptions, they will inevitably enrol some members who will fail to do them credit, and will lower not only their reputation, but also their influence and efficiency.

With regard to the main question, so far as it affects the members of trade unions, it will be remembered that in September last the Associated

Municipal Electrical Engineers (Greater London) took steps towards arriving at some measure of reform and uniformity throughout the London area. We commented upon this matter at some length in our issue of September 28th, but since then we have heard no more of it. We trust, however, that progress is being made, and that the conclusions arrived at may include some form of classification which will help towards the settlement of the dispute between the E.T.U. and the A.E.S.E.

Electricity Supply Restrictions in Germany.

It is reported from Berlin that the Imperial Coal Commissioner issued an order on November 2nd placing an immediate restriction on the consumption of electrical energy both in the case of customers of electric supply undertakings and in that of those firms or persons who possess their own generating plant. The restriction of the consumption is general, and also applies to establishments engaged on war work. The consumption is limited to 80 per cent. of that which prevailed in the corresponding month in 1916, although another period for the calculation may be accepted as the basis in special cases. If the meters are read on days other than the first day of the month, the hitherto existing reading times are to be adopted for the determination of the limitation. The Commissioner reserves the right of curtailing the consumption by more than 20 per cent. in particular cases. A preferential treatment can be meted out in respect of establishments on war work in exceptional cases.

It is held to be of special importance that consumers who have already curtailed their consumption may claim special consideration in connection with the new regulations. Consumers on a small scale are exempt from the restrictions, provided that their individual use does not exceed 250 kw.-hours per annum, but the communal authorities are permitted to fix a lower limit. New connections and extensions of existing connections can only be made on obtaining special consent, which will only be granted in urgent cases. The order provides for the appointment of honorary advisers, who will co-operate with the War Board departments and the municipal authorities, who must at once come to an agreement with the advisers concerning the limitations and the best method of arranging the distribution of energy, particularly among small consumers.

It is stipulated that consumers who receive a supply from an undertaking must pay an increase of 6d. per kw.-hour for every kw.-hour used in excess of the fixed limit. If, despite special warning, consumers do not restrict their consumption in the prescribed manner, they will be liable to imprisonment for a period of up to one year, or a fine of up to £500, or to one of these penalties. Similar regulations have been made in regard to the limitation of the use of coal gas.

As bearing upon the above question of effecting economy in the use of coal, it is stated that a daily supply of 60 trucks of coal will shortly be saved in connection with the electric lighting of Berlin, by means of a scheme which is expected to be brought into operation in January provided that the weather in the winter is not unfavourable for the completion of the work. This refers to the execution of a scheme which was brought forward prior to the war, for the erection of an overhead high-pressure transmission line between Wittenberg and Berlin, which will now be fed by the Zschornowitz-Piesteritz line, which is supplied from the Zschornowitz (lignite) power station, the generating station for works for the fixation of nitrogen. The overhead line is said to be made of aluminium-covered iron, and is being carried out by the A.E.G.

ABBOTT INSULATING CLOTHS.

On Thursday last, through the courtesy of Messrs. Abbott, Anderson & Abbott, Ltd., of Limehouse, E., and Harpenden, whose connection with the oilskin and waterproof clothing trade goes back, we understand, to Crimean times, we were enabled to visit the Harpenden works of the firm, with a view to inspecting the modern installation which they have provided for the manufacture of the "Abbott" insulating cloths—a branch of business which the firm originally entered in 1902.

It will, of course, be within the knowledge of our readers that prior to the outbreak of war we were, in a large

destroyed by fire. The works have, however, despite the war, been rebuilt on up-to-date lines, and it was this modern plant that the members of the electrical Press were allowed to view last week. Specially woven cambric and silk are employed, and the first operation is that of cutting and re-stitching the pieces, so as to secure a diagonal lay of the warp and weft; the pieces then pass to the impregnating machines, four of which are installed in a special ferro-concrete structure several stories high, while space for two additional machines is available.

Without going into details, we may say that the fabric, after impregnation in the tanks situated in the lower portion of the building, is dried by passing it through a steam heated atmosphere, which is maintained in special chimney structures extending to the top of the building. The machine allows of successive impregnations of the same material, when desired. The material is then examined, measured and cut to the required lengths, or into tape: for shipping purposes, the ends of the rolls are impregnated with paraffin wax.

The linen fabric is supplied in thicknesses of 5 to 15 mils, and the silk in 4 to 6-mil thicknesses: both the transparent yellow and black insulations are supplied, in widths up to 38 in. and lengths of 100 yards or less.

We understand that authoritative tests on a 10-mil sample showed a maximum disruptive voltage of 11,000 volts and a minimum of 8,900 volts: moreover,

Messrs. Abbott claim that their product is superior to the grades imported hitherto.

In conclusion, we need not emphasise the necessity of having a "self-contained" electrical industry in this country, especially at a time like the present. Varnished fabrics and tapes are essential for the heavy electrical machinery industry and varnished silks for the magneto and

CUTTING AND SEWING FABRIC.

IMPREGNATING HOUSE.

measure, dependent on American and Continental makers for impregnated fabrics suitable for electrical insulation, and our own Customs returns bore witness to the fact that quite a considerable import business had sprung up in these goods, of which, according to available statistics, 1½ million yards were received annually in this country—though whether that amount was used here does not appear so certain.

In any case, Messrs. Abbott can meet requirements up to three-quarters of a million yards per annum in their present buildings, and with the space available could easily double this output if the trade required it. At the outset the problem confronting the firm presented difficulties of both a

INSPECTING FINISHED INSULATING CLOTH.

technical and economic character: it was, for instance, difficult to obtain the right kind of cloth for treatment, and the proper varnish for impregnating it: the design of the necessary machinery was also a matter for much thought and ingenuity.

However, these difficulties were surmounted by Messrs. Abbott, and, in spite of the keen competition of imported material, they had a steadily increasing business up to 1916, when the whole of their Harpenden works was, unfortunately,

INSULATING TAPE CUTTING MACHINE.

instrument trade, and it is to be hoped that Messrs. Abbott, Anderson & Abbott's enterprise in this direction will be appreciated by electrical men, not only at the moment, but in the more strenuous commercial times that lie ahead.

The Whitley Report.—Mr. F. Huth Jackson, presiding last week at a meeting of the National Alliance of Employers and Employed, said, according to the *Times*, that Mr. G. H. Roberts had declared that it was the intention of the Government to appoint a Parliamentary Committee, of which Mr. Whitley would be chairman, to consist of three members from each party of the House of Commons, which, in consultation with the National Alliance, the Industrial League, and other similar bodies, would consider the best means by which the recommendations of the Whitley Report should be carried into effect.

THE SALARIES OF CENTRAL-STATION OFFICIALS.

By G. W. STUBBINGS.

ALTHOUGH the bulk of the discussion regarding the subject of this article has referred to the salaries of charge engineers and switchboard attendants, there is little doubt that acute dissatisfaction is generally felt by all the members of the technical staff. A brief study of a list of the salaries paid in the principal London undertakings will convince anybody that something is wrong, and this is confirmed by the sense of grievance felt by most technical officials, it being fair to state that such officials are of a class not accustomed to grumble without sufficient cause. It is but to state a truism to say that criticism, to be useful, should be constructive, and it is the writer's belief that it is largely due to the fact that central-station officials have never proposed any rational scheme by which their salaries should be determined, and on the observance of which they could insist, that so little has been done. The difficulties in devising such a scheme are very great, both on account of the diversity in the sizes of the various undertakings, and on account of the difference in the responsibilities and scope of the work of officials in undertakings of comparable size having the same official title.

In the case of workmen it is not a difficult matter to fix on an equitable wage. A wireman, for instance, does very much the same work whether he be employed on an undertaking having an output of one or a hundred million units per annum. The responsibilities of the supervisory staff will vary with the output, and, further, the difference in the meaning attaching to some titles in various undertakings introduces a further complication. This difference is most marked in the case of the distribution sections of electricity undertakings. A comparison of the outputs of two undertakings, A and B, will give no certain indication of the duties and responsibilities of the two mains superintendents. At A this official may be nothing more than a mains foreman, the more difficult work being looked after by the chief assistant; while at B the mains superintendent, besides having complete charge of the mains, may be also responsible for the testing, public lighting, and tramways overhead sections. The problem, then, of devising a rational basis for the calculation of salaries is by no means easy.

The first principle to be suggested in this attempt to solve the problem, is that a man's salary should bear some definite relationship to his responsibilities. This is incontrovertible. The simplest application of this principle would be a rule by which the salary would be directly proportional to the responsibility. This is hardly equitable, as placing the small man at a great disadvantage. The second principle that occurs to the writer will obviate this defect. This principle may be briefly described as that of a minimum salary which represents a return for a man's general training and fitness, apart from his responsibilities. The algebraical expression for the salary attaching to a particular post will now be: of the form— $y = a + b x$, y being the salary, x the responsibility, a the minimum wage, and b a constant to be decided upon.

The constant a should be equal to an amount sufficient to cover the bare necessities of living, as most people will concede that a man who is working is, by reason of his working, entitled to this. It is worthy of discussion as to whether this constant should be different in the case of a married man from that of one who is single.

The term x , representing responsibility, is a difficult one to fix. It must obviously be represented by some easily determinable quantity. Such quantity will, however, be different for each official. For the works superintendent the plant capacity is a good indication of the scope of responsibility; but this would be almost irrelevant in the case of the chief clerk, when the number of consumers would be a fitting criterion. The variable part of the formula will, in the case of the mains engineer, include a number of terms according to his responsibilities; one, for example, for his mains work, another for public lighting

work, and so on. Mathematically, the complete equation will be: $y = a + \sum b x$.

The writer suggests the following criteria for determining the responsibilities of the various officials. The particular number in each case, whether KW. capacity or number of consumers will be x in the formula.

Works Superintendent ...	Plant capacity.
Charge Engineer ...	Maximum load.
Draughtsman ...	Plant capacity.
	Miles of cable.
Chief Clerk ...	Number of consumers.

The value of b would vary according to whether or no the rendering and collecting of consumers' accounts were undertaken by the office.

Meter Superintendent ...	Number of meters.
Commercial Assistant ...	Population of the area of supply.
Mains Superintendent ...	Miles of cable.
	Number of meters.
	Number of public lamps.
	Miles of overhead tramway equipment.

Only those items applicable to the particular case being included. In cases where considerable mains extensions are carried out by the mains engineer, he should be paid a percentage on the cost of the job.

When an undertaking reaches a moderate size the problem is complicated by the fact that assistant supervising officials are employed. The responsibility of the chief official will then largely depend upon the ability of his assistant. A man with an assistant who is capable of looking after any section of the work in his absence, has far less worry and anxiety than one who has an assistant confident to carry out routine work of minor responsibility only. The most equitable way out of this difficulty seems to be to calculate the total salary to be paid to the department, the formula being in this case $y = na + bx$, n being equal to the number of officials. Having fixed the total salary, the apportionment of the same can be made by the chief engineer of the undertaking concerned, who would have an intimate knowledge of the capabilities of the officials concerned.

The matter dealt with in this article is a very difficult one, and the writer is well aware that his suggestions may be faulty in many respects. As no previous attempt of the kind appears to have been made, these suggestions may serve as a start. The dissatisfaction of central station officials is certainly not without good cause; but all must remember that to obtain redress it is not sufficient to be dissatisfied, or even to express dissatisfaction. It is necessary to know with certainty what one requires. A set of requirements calculated on some such rational basis as suggested in this article would, in the writer's opinion, be of great assistance and carry great weight. It is hoped that the scheme outlined above, although hastily considered, may assist central station officials in formulating definite requirements.

£100,000,000 a year from State Power.—Speaking at the Aldwych Club recently, Mr. H. Wilson-Fox, M.P., honorary secretary of the Empire Resources Development Committee, stated that the National Debt after the war would probably amount to £6,000,000,000, necessitating an annual revenue of at least £600,000,000. The policy advocated by the Empire Resources Development Committee was the development under State auspices of some of the resources and opportunities of the Empire, under conditions which would give to the State a direct financial interest in the results. The wastage in our power supply was almost incredible. Ten years ago the Witwatersrand goldfields were equipped with the best individual steam-power plants that money could command, and coal was available near by at from 2s. 6d. to 5s. a ton; yet, by the introduction of a central power system a saving of £3,500,000 had been effected in the working of the mines themselves; which saving, added to the sum of £500,000 paid by the Power Co. in dividends and interest on debentures, meant that on the original outlay of £7,000,000 there had been a total return to all concerned of upwards of £1,000,000 per annum, and that without utilising by-products.

In 1907 the total engine capacity in this country was estimated at 10,587,870 h.p., of which about 2,500,000 h.p. was employed in the production of electrical energy. If a considerable proportion of this equipment were centralised, and care were taken to make a profit from by-products, as well as from the sale of power, the State could derive a profit of at least £100,000,000 per annum, while considerably reducing the cost to the consumer.—*Financier*.

DOMESTIC ELECTRIC HEATING PROBLEMS.

(Concluded from page 478.)

Heater Comparisons.—A booklet, published by the Hotpoint Co., who are, of course, strong advocates of the open-coil (or so-called "red-hot") type of heater, contains the results of various tests on these and disk-type hot-plates.

The company's Reflex open-type heater (in which a reflector assists in concentrating the heat rays on the bottom of the utensil), a moulded block open-coil type heater and a disk-type heater, each of 1,000 watts loading, were used, and the curves, fig. 1, were obtained on the basis of raising the temperature of one quart of water from 70 to 210° F. starting from cold.

These show the superior efficiency of the Reflex heater for short boiling periods with average utensils; further tests in comparison with gas gave the following results:—

	Reflex.		Block.		Disk.		Gas.	
	Time, min.	Eff., p.c.	Time, min.	Eff., p.c.	Time, min.	Eff., p.c.	Time, min.	Eff., p.c.
Dish—								
Enamelled	15'14	45'4	18'95	36'3	26'6	38'7	14	34'2
Aluminium	16'12	42'6	20'12	34'2	24'36	42'3	13'25	35'8

The test was made by raising two quarts of water from 70 to 210° F. with a covered utensil, starting from cold; the heater capacities were:—Reflex, 1,500 watts; block, 1,500 watts; disk, 1,000 watts; and a "standard medium-sized gas burner operated with a maximum flame."

Some independent tests carried out by an Indian contemporary on the Reflex heater and a popular type of English hot-plate are of interest. In this case a special block-tin copper-bottomed kettle was provided for the hot-plate or disk-type heater, also an ordinary enamelled kettle, and both were used on each type of heater. The Reflex heater was of 600, and the disk stove of 800 watts capacity; the tests were made with one quart of water at an altitude of 8,000 ft., where the boiling point is, roughly, 197° F.

The results were as follows:—

Disk stove.					Reflex.			
Test No.	Units.	Temperature rise deg. F.	Time in minutes.	Efficiency per cent.	Units.	Temperature rise deg. F.	Time in minutes.	Efficiency per cent.
1	0.292	131.5	20.23	32.69	0.163	137	14.82	61.02
Starting from cold with enamelled kettle.								
2	0.254	135.5	17.42	38.64	0.1874	134	17.02	51.91
Starting from cold with disk stove kettle.								
3	0.166	137	10.53	59.92	0.1470	139	—	68.65
Starting from hot with enamelled kettle.								
4	0.1266	137	8.93	78.56	0.1796	136	15.97	54.98
Starting from hot with disk stove kettle.								
5		148 191	◀ Current switched off at ▶ ▲ Temperature rose to in 10			148 156 in 1.8		
Stored heat test.								
6	0.185	130	23.81	51.02	—	—	—	—

Maximum efficiency test for disk stove from cold, with kettle belonging to disk stove.

In test No. 5 the water was raised to a certain temperature current being then switched off and the further rise in temperature noted till the latter became stationary. Test No. 6 was intended to ascertain the maximum efficiency in use by an experienced person who could judge when to switch off, so as to economise to the practicable limit.

The tests clearly indicate the high efficiency of the Reflex type of heater for intermittent use, and especially with ordinary utensils, but where cooking is carried out on a large scale and the range is in continuous use, the disk type of heater with its special utensils attains a very high efficiency.

Domestic Electric Cooking Costs.—Some data recently published by the Ontario Hydro-Electric Power Commission on energy consumption for domestic cooking, of groups of consumers in Ontario towns, is of considerable interest.

The consumers are divided according to size of family and the monthly energy consumption and bills, both prior to and after the installation of electric cooking are given.

For London (Ont.) data for 252 families is given, and we note that the monthly range consumption increases, roughly, in proportion to size of family from 119 KW.-hours for two people to 256 KW.-hours for nine people; also the monthly range bill similarly increases proportionally from \$1'15 to \$2'38 and the range cost per month per person decreases proportionally from \$'58 to \$'26. The installed range capacity varies from 5'13 to 6'5 KW. per family.

The London (Ont.) tariff is 3 cents per 100 sq. ft. of floor area plus a primary meter rate (3 cents) per KW.-hour for the first three

FIG. 1.

	Reflex.		Block.		Disk.	
	Time, min.	Eff., p.c.	Time, min.	Eff., p.c.	Time, min.	Eff., p.c.
Dish
Enamelled	10'56	48'8	11'83	34'7	17'75	29'0
Aluminium	11'2	46'0	15'0	31'3	16'0	32'3

KW.-hours per month per 100 sq. ft. floor area, plus a secondary rate (1 cent) for excess consumption. Taking the average of all the London (Ont.) cooking consumers, the use of the range has increased their energy consumption, roughly, five times (39 KW.-hours to 200 KW.-hours per consumer per month) and their electricity bills by two-and-a-half times (\$1'09 to \$2'67 per month).

In St. Thomas, where similar rates obtain, averaging all consumers the monthly consumption per consumer has increased from 44 KW.-hours to 207 KW.-hours, and their electricity bills from \$1'24 to \$2'78, while in Windsor, where a higher rate is charged, the energy consumption with the range in use is five times as great and the bills 2'7 times as great.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

Sub-Station for the Co-operative Wholesale Society.

For the purpose of converting the 100-volt continuous-current supply of the Manchester Corporation to the requirements of its central premises and warehouses in Manchester, the Co-operative Wholesale Society has laid down a neat and attractive looking

FIG. 1.—THE SUB-STATION OF THE CO-OPERATIVE WHOLESALE SOCIETY AT ITS CENTRAL PREMISES, MANCHESTER.

sub-station containing the necessary converting machinery and distributing switchboard; power from this sub-station is utilised for driving lifts, hoists, &c., and for lighting.

The contract for the plant was placed with the GENERAL ELECTRIC Co., and includes four 90-KW. motors for driving existing generators, two 63-KW. motor-generators, and one 47.5-KW. motor for driving an existing generator. These sets run respectively at speeds of 410, 600 and 300 R.P.M., the motors and generators being mounted on combination heliplates.

The switchboard is arranged in two portions at right angles to each other; one portion devoted to the control of the motor-generators consists of eight panels, seven for the machines and one for the incoming supply. Each panel accommodates the necessary apparatus for starting the motors mounted on the lower slab, while above are the necessary circuit-breakers, ammeters, relays and shunt regulating gear. Paralleling voltmeters are carried on brackets at the end of the board, while on a pediment on the top of the board are mounted an illuminated dial sector pattern ammeter and voltmeter. The distribution switchboard comprises 16 panels, each of which controls six distributing circuits. Every panel is composed of two slabs, both carrying the circuit-breakers for the respective three circuits. On the upper slab is also mounted a sector pattern ammeter with rotary multi-point switch, enabling the shunts on each circuit to be connected to the ammeter. This switchboard is also provided with a pediment, including a sector type ammeter and voltmeter, and a non-magnetic clock.

The lighting is effected by G.E.C. semi-direct fittings, and the sub-station is very neatly laid down and effectively finished.

The complete equipment was supplied by the General Electric Co., Ltd., of Witton, Birmingham, through their local office at Victoria Bridge, Manchester.

Indebtedness is expressed to the Co-operative Wholesale Society, Ltd., for permission to take the accompanying illustration, and to publish these remarks.

Husband Oil-Engine Sets.

Our view, fig. 2, shows one of the new "valveless" oil engines with cooling water tank, &c., mounted on a truck as portable unit, and supplied by MESSRS. F. HUSBAND, LTD., of Craven House, Kingsway, W.C.2. The engine is of the two-stroke cycle type, and its design, though having special features, is along the simple lines associated with that type of engine, the valve gear of the

FIG. 2 HUSBAND PORTABLE OIL-ENGINE SET.

four-cycle type of engine being dispensed with. The engine is, however, claimed to be much more efficient than the ordinary two-cycle engine; a positive system of lubrication is fitted, and high-tension magneto ignition, the magneto being mounted on the governor case. The engine is fitted with a flywheel pulley, and is suitable for driving a dynamo, pump, or other machinery.

New Transformers.

MESSRS. JOHNSON & PHILLIPS, LTD., of Charlton London S.E., have brought out an ingenious portable testing transformer, provided with hoops, as shown in fig. 3, which enable it to be rolled along the floor of the workshop or test-room to the place where it is to be used. The device may be open (as illustrated) or protected, or totally enclosed, and is made in sizes up to 25 K.V.A., and 6,600 volts, single or three-phase.

Another useful novelty is the application of the transformer

principle to the heating of shell bands, as shown in fig. 4. This has the advantages that it can be placed in any convenient position, heats the rings uniformly and without producing scale or burning the bands, is free from smoke, flame, and fumes, and is safe from

FIG. 3.—J. & P. PORTABLE TESTING TRANSFORMER.

fire risk. It is easy to manipulate, the arm being counterpoised, so that it can be raised to slip the band into place; the heating takes from 1 to 1½ minutes, according to the size of the band, and

FIG. 4.—J. & P. SHELL-BAND HEATING TRANSFORMER.

From 200 to 400 bands can be dealt with per day. It is wound for any standard frequency and any voltage up to 550 volts. A similar type is being developed for heating steel tires and shrink rings generally.

A New High-Frequency Induction Furnace.

An interesting development in small electric furnaces has been made by Dr. E. F. NORTHROP, of Princeton University, in conjunction with the PYROELECTRIC INSTRUMENT Co., of Trenton, N.J., and under the direction of the Ajax Metal Co., of Philadelphia, Pa.

The furnace uses oscillatory currents for the generation of heat. By the use of a highly effective induction, currents can be set up in the containing crucible in the case of a non-conducting melt, or in the melt itself, if the same has sufficient conductance. It is possible to raise the temperature of a melt in a crucible until its resistance becomes low enough to permit the generation of heat in the substance itself (as in the case of melting glass), after which the temperature producible is limited only by the durability of the insulation and container.

The furnace is especially suitable for alloy research at temperatures above 1,100° C., inasmuch as it makes possible the running of melts in vacuo or in any atmosphere desired, particularly in one free from carbon. With a 20-KW. furnace, which is the largest size so far built, a temperature of 1,620° C. has been easily attained. Theoretically, there is no temperature limit, but practically there is a limit because of the necessity for proper heat insulation between the containing crucible and the outside coil.

What is actually accomplished is to induce countless eddy currents in the melt itself, provided it is a conducting substance, by the use of oscillating current at a frequency of about 12,000 cycles. If the melt is of a non-conducting substance, such as glass, a conducting crucible such as graphite is used. Eddy currents are then induced in the crucible, which in turn heats the

glass, rendering it conducting as it rises in temperature, after which eddy currents are set up in the glass itself. — *Met. and Chem. Eng.*

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

A Portable Electric Lamp Cooking Box.

I am very pleased to see that Mr. Edwards is having a try at the most sensible type of cooking apparatus yet made, and I sincerely wish him success. At the same time, I would ask him to reserve a good share of his ingenuity to use in persuading people to see the good points in his apparatus.

One of the most energetic and prominent advocates of cooking by electricity once told me that any man who wanted people to buy his cookers would make them to look as much like gas cookers as possible if he wasn't a — fool; and I found he was quite right. Gas ovens and electric ovens are so much alike that they can easily be mistaken the one for the other; moreover, to a large extent, they are both made in the same workshops.

Some years ago I made several pieces of apparatus, using lamps as heaters: one was a food warmer for use in the nursery. This was a straight-walled tin pan with a wooden handle, through which the flex wire passed to a S.B.C. holder and a 5-C.P. Edison No. 3 lamp, see fig. *a*. In the side of the pan was a round hole about 1 in. diameter, having a mica window; this enabled the apparatus to do duty as a night light. In the top of the tin pan a porcelain cup with a "well" was fitted, and a cover over this completed the apparatus. I succeeded in keeping only one of those in sight; it completed its duties in the nursery, and was afterwards used by an elderly Lady—(capital L)—for several years.

Another was a foot warmer for use in bed. This consisted of a round straight tin about 9 in. long and 3 in. in diameter, with the

usual slip-on lid. A 1½-in. hole was cut in the bottom, and a Belsize lampholder was used—held in position by the shade carrier ring; a flannel cover, with a tape run in a slot at each end, and drawn up after being slipped over the tin, and an 8-C.P. lamp completed this apparatus, fig. *b*.

This caused trouble, as it was found impossible to convince people that an 8-C.P. lamp was the largest power that should be used; consequently, 16's were used, and scorched sheets resulted. To get over this, three-prong lamps and holders were used; then the lamps were difficult to get.

Another was a wooden hot-cupboard with a tin lining packed with felt, about 20 in. × 20 in. and 24 in. high: the heater was a shelf like a meat tin turned upside down and eight lamps of 16 C.P. were used, fitted inside the tin, fig. *c*. This produced very uniform heating, being a radiator for the lower half and a convector for the upper half. When the air-tight door was kept closed, the heat melted the solder out of the joints of the tin lining in one instance.

There were other things on the same lines, but none of them had the remotest resemblance to gas apparatus, and I found that the description of people who didn't make their apparatus look like gas things fitted me rather too well. Better luck to Mr. Edwards.

J. JACKSON.

Harrow, November 12th, 1917.

The Association Movement.

Mr. Atkinson's letter in your last issue is not satisfactory. In his letter to you of October 18th he made the following statement:—

"From inquiries made since Mr. Berry's article appeared it would seem that he certainly had the idea to found a trade organisation, and took some steps in that direction, but these came to nothing."

In his letter of November 14th he says:—

"I am authorised to state that, in the opinion of those present, my letter of October 18th correctly sets out the position."

I regret to have to state plainly, but firmly, that that statement, now persisted in, is untrue, and I propose to prove it. I agree the matter is one which is probably of little interest to the majority of your readers, but Mr. Atkinson, by an ingenious dislocation of the facts as they occurred, has contrived to discredit some of my statements. That is a situation I cannot tolerate for a moment.

Without vouchsafing any proof, Mr. Atkinson fires a parting shot wide of the mark, and, adopting the tactics familiar to us, endeavours to obscure the issue by a cloud of generalities; in effect he says:—"As far as I am concerned, I now propose to disappear in the fog." That self-effacement, however, cannot be permitted without protest.

The proper course for the Association to pursue, in my opinion, was to accede to a request I have lodged for an impartial investigation. That course they have decided not to adopt. The reason is obvious: they have no case. I have, however, already said that Mr. Atkinson has not adhered to the facts. I now propose to produce the evidence to prove it.

The following letter, of which the enclosed is a copy, has been carefully kept by Messrs. Siemens Bros. & Co., and sent to me by Mr. A. J. Easton. It was written by me on December 9th, 1898. The Cable Makers' Association have been duly furnished with a copy. It reads:—

(Copy.)

"The Arts Club, Manchester.

December 9th, 1898.

"DEAR MR. EASTON,—With reference to my conversation with you on Monday and Tuesday last, I have independently visited the two largest manufacturing firms in the North of England to ascertain their views on the subject of our discussion, and I found them most ready to enter into the question. Both firms have expressed their entire willingness to support any concerted steps which may be taken to further an object which they consider it is absolutely necessary should be brought about with as little delay as possible. They agree that the matter is one of vast importance, and they believe it is possible to constitute a combined movement which should be a lasting benefit to the comparatively small community whose interests are so much at stake.

"In the present state of the raw material market, I gather that these manufacturers are, as you surmised, selling wires and cables at the present moment *below* cost price in many instances, and they consider such a state of things, existing in an enormous industry where the actual number of manufacturers is so limited, to be highly disastrous. I may add that they would be willing to attend a meeting, called in London or elsewhere, immediately, to discuss the most practical way of dealing with the difficulty. I have not time at present to send you any further information upon this subject, but I should like to add that I have been careful to suppress Messrs. Siemens Bros. & Co.'s name throughout, except to say, as you suggested, that I was *under the impression* that you were as anxious as they were to consider this matter. I would further remark that I have consulted with principals only upon each occasion, and they sufficiently realised the gravity of the question to suggest the most rigid secrecy, and the inadvisability of sending any official written communication whatever about this matter until such time that it would be safe to do so. I should like if possible to have an opportunity of talking this matter over with you and Mr. Siemens, and I would suggest Monday, at 11 o'clock, if convenient. I will call then unless I hear from you to the contrary. Meanwhile, believe me, yours faithfully,

(Signed) HERBERT BERRY."

One of the principals referred to in that letter was Mr. Taylor of Helsby, who discussed with me an earlier effort he had been interested in, and to which I shall refer later. He agreed to attend the meeting to be called in London, or elsewhere. Shortly after that, the other conferences took place to which I have already referred, and finally I laid my plans, for the first time, before Mr. Henry Edmunds, then chairman of Messrs. Glovers, Ltd. Almost immediately afterwards the suggested meeting took place.

It was agreed that Mr. Edmunds should complete the arrangements, and he was elected to the chair. I am not concerned with Mr. Edmunds's subsequent constructive proposals; I have never claimed any interest in them. They may, or may not, have differed from the proposals which figured at the first, but by then defunct, Cable Makers' Association. It can be assumed with certainty that the proceedings were ably conducted.

My whole point is that I conceived the idea to found the second Cable Makers' Association. I did the spade work, and obtained the consent of the principal parties concerned to attend a meeting in London, and they did so. If that is not laying the foundation stone, then perhaps Mr. Atkinson will tell us what is.

The point, however, which I now wish to clear up is Mr. Atkinson's statement, which I here repeat:—

"From inquiries made since Mr. Berry's article appeared, it would seem that he certainly had the idea to found (a) trade organisation, and took some steps in that direction, but these came to nothing."

Let there be no mistake about that remark, because Mr. Atkinson now says:—"He is authorised to say that he has correctly set out the position." I say definitely that it was the first Cable Makers' Association which came to nothing. I had nothing whatever to do with that. It was, as a matter of fact, inspired by Mr. Henry Edmunds and others. I have reason to know it, because he told me so at my interview. Every old-established wiring contractor, and there are hundreds of them, remembers the first C.M.A. It flourished for a short while, but suffered a premature death. Does Mr. Atkinson propose to deny that? If so, let him come forward and furnish dates.

It was remarked to me by a member a few years ago that the existence of the Association had probably meant at that time an increase to the members' joint coffers amounting to a million pounds sterling. If that figure was not over-estimated, it will be a matter of small surprise that the credit for the origin of the second Cable Makers' Association is much coveted, especially by those who, figuratively speaking, are wallowing in their accumulated wealth.

I admit that it must be galling for the Association to be called upon to apportion the credit according to its due, when by so doing it involves including someone situated outside the charmed circle; but surely that course would have been more dignified and sportsmanlike.

With regard to Lieutenant Paterson's letter, I am quite content with his statement that, so far as Messrs. Johnson and Phillips's Cable Works are concerned, it is a fact that he was first approached by me. If Mr. Atkinson gets comfort out of the fact that, in spite of that, Mr. Edmunds was referred to often as the "father," he is welcome to it.

In conclusion, I would add that, in carefully chronicling the genesis of the second C.M.A. in so far as my share of it is concerned, I was completely unconscious of the fact that, in so doing, I was shaking the foundation of a Golden Image which Nebuchadnezzar, their King, had set up.

Herbert H. Berry.

London, W. 1, November 19th, 1917.

The E.T.U. or the A.E.S.E.?

The station engineers are at last waking up to the benefits to be obtained by united action, yet they are straightway making the serious mistake of dividing into two camps.

Let the members of both organisations bridge the split at the outset, or else examine impartially the policy of both, and join the one that is the stronger to obtain what we want, *i.e.*, more pay and better conditions of employment.

E. T. U. Ease.

Up to recently (I have read your paper for the past 25 years) the "Correspondence" columns of the REVIEW were invariably sought after for information, and were considered to be edifying and beneficial. The correspondence in your present issue with reference to the exults of the E.T.U. is hardly so, however. I am not myself interested in any trade union or society, and personally have not the pleasure of knowing Mr. Napier, but whatever good is served by publishing the aimless generalities of W. J. Webb, or the senseless drivel of H. H. Morton (who, with all his sneers, does not deny any statement made by Mr. Napier) I fail to see. In the past, when correspondents lapsed into slang and personalities a small footnote invariably appeared somewhat to this effect, *viz.*:—"This correspondence must now close," and I think your paper would be considered to be the cleaner if this were done now.

X.Y.Z.

[None know better than Editors that it is impossible to please everybody; on the other hand, the public ventilation of such questions as the subject of this correspondence is a duty which must be fulfilled, and in performing it we have endeavoured to be scrupulously fair to all parties, at the cost of space which, we must admit, we have grudged. As regards the ban on slang and personalities (which are not wholly absent from "X.Y.Z.'s" letter), it is evident that our critic has overlooked the "small footnote" which appeared on p. 467 of our last issue.

In justice to ourselves, we must point out that the fundamental question which underlies this correspondence—namely, the method by which the staffs of electricity supply undertakings, from the chief to the humblest employé, shall obtain the adequate remuneration for their services to which they are justly entitled—is one which is of absorbing interest to some thousands of men; there may be many, like "X.Y.Z.," who are not concerned with this subject, but we trust that, in the interests of their fellows, they will exercise a generous patience for a time. The matter has now apparently come to a head, and in our leading columns to-day we comment on it—Eos. Elec. Rev.]

An Electricity Supply Engineers' Association.

It is to be regretted that your valuable pages are occupied weekly by letters relating to the contest between the E.T.U. and the A.E.S.E., and the excuse for adding one more to the number is the hope that it will tend towards a settlement, not only of this small issue, but some matters which are perturbing the minds of electricity supply engineers generally at the present time.

It is admitted there are capable men in both the E.T.U. and the A.E.S.E., and they ought to get together and determine as regards their members where the E.T.U. finishes and the A.E.S.E. begins. If that is difficult, they could leave the junior charge engineers as a sort of "No Man's Land," and let them decide for themselves which they will join, as it appears to be there where the most divided opinion exists. As the parties are going on at present, both sides are wasting a lot of time and money without any good results.

The root cause of the trouble is the increase in the cost of living, and the inability to exist on the salaries which were too low even in peace-time, and the reluctance of the authorities to grant justified increases. This has resulted in the juniors, and, in fact, some seniors, being anxious to obtain the increase of wages awards which were primarily intended for workmen. The awards are more easily obtained through trade unions, but the professional engineer does not like the idea of joining a trade union, and quite right, too; but how can he obtain his due otherwise, as there does not exist at present a professional association that can assist him?

The A.E.S.E. has taken up the case for the juniors, and a few seniors have thrown in their lot with them, but they are so few that the Association could not put in a plea for the seniors. An attempt, therefore, is being made to obtain more senior members for that Association, but it appears to be starting from the wrong end for a junior association to be setting about organising the seniors, and therefore very little support is expected.

What else, then, have we got? There is the Chief Technical Assistants' Association for municipal seniors, but I believe there are a few of those who are not in the Society. As for the company seniors, they do not appear to have an association at all, and there are separate associations for company and municipal chief engineers. Now, so far as I know, all these associations were formed ostensibly for the purpose of interchange of technical and administrative knowledge, and not one offers assistance in the question of remuneration.

This is the paramount question to-day, as it is difficult to make ends meet on the old salaries, and when the engineers are working strenuously, as, of course, they should be in these times, they feel the differences in remuneration existing for similar posts in stations of the same capacity, and the matter ought to be put right without delay.

The Institution of Electrical Engineers, which comprises all the grades, is purely a scientific society, and it should remain so, far above commercialism. What we need, then, is a comprehensive association for all professional electricity supply engineers in the Kingdom (chief engineer to junior inclusive), solely for dealing with questions of professional status, remuneration, and matters of common interest, and able to make its presence felt if need be. This should be quite distinct from the existing technical associations, and should have an executive committee, consisting of chiefs, seniors, and juniors, meeting, say, monthly, or oftener if need be, and an annual general meeting.

Will our chief engineers, company and municipal, London and provincial, get together in our mutual interests and arrange a meeting, say at Westminster, to thoroughly discuss the question, and invite our I.E.E. President, Mr. Wordingham, to kindly consent to take the chair? I feel sure they would find the time would not be wasted.

Chief Assistant.

The Teaching of Electrical Installation Work.

In view of the adverse criticism of the tuition given to students desirous of acquiring knowledge of electrical installation work, it occurs to me that some of your readers may be interested in the Wireman's Class at the Trades Training Schools, Great Titchfield Street.

This is probably the best equipped and best attended class of its kind in the London district, and numbers among the students not only boys and improvers, but men of mature years anxious to improve their knowledge of this class of work.

A full complement of tools has been provided, with ample material, and, furthermore, to enable power work to be taught, a small but complete electrical factory equipment has been purchased, and is being installed by the students this session.

If anyone interested in the subject is inclined to visit the schools on class nights, Monday, Wednesday, or Friday, I shall be pleased to show him the facilities we have at hand for teaching this important subject.

S. Nichols,
Instructor.

London, W., November 19th, 1917.

AN INSTITUTION OF ELECTRICITY SUPPLY ENGINEERS.

A CONFERENCE of senior technical officers drawn from company and municipal electricity supply authorities of the London area was held at the Hammersmith Electricity Works on the evening of Thursday, 15th inst. The meeting was convened by the Executive Reconstruction Committee of the Association of Electrical (Station) Engineers of London.

The chair was taken by Mr. F. HILL, chief assistant electrical engineer to the Hammersmith Borough Council, who, in his opening remarks, briefly stated the objects of the conference. No one who had followed recent developments could doubt the necessity for concerted action on the part of central-station engineers, and it was proposed to place the true facts of the situation before that meeting in order that they might be in a position to judge of that necessity. He called upon Mr. H. W. Healy, President of the London Committee of the A.E.S.E., to outline the history of the Association movement and the recent developments.

Mr. HEALY first expressed the thanks of himself and those of the junior men associated with him to Mr. G. G. Bell, the chief engineer and manager of the Hammersmith electricity works, for the encouragement of his practical interest in their efforts. After dealing with the early history of the A.E.S.E. and its development to date, he gave a detailed report of the action taken by the junior staffs of the London power stations to ensure that their interests were not represented by outside bodies. Steps had been taken to get together a representative committee of six men to prepare schemes of reconstruction, and with that end in view they had issued invitations to the senior technical officers. It did not appear beyond the range of practical politics to agree upon definite lines of concerted action which would place all questions affecting the financial interests of central-station engineers, from chief to junior, above the level of barter. On the broad questions—standard of efficiency, status of the profession, and adequate remuneration—there was no division of opinion. On those matters the interests of seniors and juniors were common. The existing associations did not, as at present constituted, meet the needs of the case, and he would suggest as a basis of discussion that perhaps a new body could be formed to deal with these broad questions, leaving the existing associations to develop until the time was ripe for them all to be embraced.

In the discussion which followed, Mr. A. P. MACALISTER (Islington), speaking from considerable past experience of organisation of associations, emphasised the difficulties of securing co-operation between seniors and juniors, and held that it was not always possible for company and municipal engineers to meet for mutual discussion. He had many times suggested to the senior men of the company undertakings that they should form an association. He suggested that a solution of the difficulties could be found in affiliating the sectional associations.

Mr. F. D. NAPIER (North Met. E.S. Co.) reviewed the remarks of the previous speakers, and expressed himself as in entire agreement with the necessity for concerted action. If that course were followed, all questions affecting the interests of any grade could be settled by constitutional procedure. He then moved the following resolution:—

"That this Conference of Senior Technical Assistants appoint a committee of nine to confer with the existing Association of Electrical Station Engineers' Committee on the questions of construction and reconstruction. The representatives appointed to be three from the companies' staffs, three from the C.T.A.A., three from municipal staffs. The recommendations of the combined committee to be placed before a general meeting to be held in due course."

Mr. H. F. J. THOMPSON (chief assistant engineer, Battersea) moved a resolution in similar terms, subsequently seconding the original resolution. Speaking from a lengthy experience in the service of both company and municipal supply authorities, he could not see where the staff interests clashed, although it was quite possible that there might be something in the suggestion. He endorsed the remarks of previous speakers regarding the need of a comprehensive association.

Mr. W. YOUNG (chief assistant engineer, Stepney) supported the suggestion, and pointed to the work done by the C.T.A.A. It had been formed for academic purposes, and had undoubtedly achieved excellent results.

The resolution was then put to the meeting and carried unanimously. Nominations followed, and a provisional committee was elected as under:—

Mr. C. O. GRIMSHAW, Westminster E.S. Co.; Mr. F. D. NAPIER, North Met. E.S. Co.; Mr. W. E. A. ROLAND, St. James's and Pall Mall E.L. Co.; Mr. A. P. MACALISTER, Islington; Mr. H. F. J. THOMPSON, Battersea; Mr. W. YOUNG, Stepney; Mr. GATTRIL, Finchley; Mr. F. HILL, Hammersmith; Mr. G. C. LAW, Barnes. Mr. H. W. HEALY (Battersea) was elected hon. secretary.

It was resolved that the hon. secretary be instructed to approach the Associations of London Company and Municipal Chief Engineers, inviting them to appoint three representatives from each association to meet the provisional committee.

The meeting closed with a hearty vote of thanks to the chairman, Mr. F. Hill.

No fewer than 75 station engineers (senior technical officers) were present; never in the history of central stations has there been so representative a gathering. From the course of events, it would appear that the time may not be far distant when an Institution of Electricity Supply Engineers will be an accomplished fact.

WAR ITEMS.

Exports to China.—The "London Gazette" for November 20th contains names of further persons and bodies in China to whom exports may be consigned.

Railways After the War.—Last week, Sir A. Stanley stated that the Board of Trade, in consultation with the Ministry of Reconstruction, was giving close attention to the problems that would arise when the present war control of railways ceased. The Board was being advised by a number of gentlemen possessing expert knowledge or experience, but they did not constitute a formal committee, and there were therefore no terms of reference.

British Homesteads.—The staff and workmen of Messrs. Thomas Firth & Sons, Ltd., have subscribed £25 to the British Homestead Association in response to an appeal in the Northern Press. As this is regarded as an indication that those employed in the other great engineering works throughout the country are likely to be equally interested in the movement, we are asked by the President (the Hon. Mrs. Murray) of the Association, whose offices are at 47a, Portland Place, London, W.1, to state its objects. The work which it has set itself to do is to look after discharged officers and men of all His Majesty's Services whose state of health may not be such that they may reasonably expect to follow their calling directly they are discharged, and to provide them with comfortable homes and an opportunity of healthy exercise on the land, so that they may fit themselves either for work on the land in some form or other, such as small-holdings, or for some handicraft, trade, or profession. Up to the present time two homesteads have been acquired, one at Congleton, in Cheshire, called the David Little Memorial, and the other near Bexley, in Kent, known as the Kinnison Memorial. Although the State grant of 27s. to men who are being trained in an approved scheme is sufficient to keep them, it does not give a man facilities for getting the best kind of training possible, such as they deserve. Nor is it likely always to give them opportunity for complete development of their powers. We commend this very worthy movement to the interest of readers who may be able to contribute to the funds, and so help to set up in life again those who have sacrificed so much.

Exemption Applications.—The case mentioned last week as being before the Hants Appeal Court (the Military appeal against exemption given to a young man of 18) was in- correctly stated. We understand that no such appeal has been made in respect of the Winchester Corporation electricity department, and that there is no assistant aged 18 on the staff.

At the Shoreditch Tribunal, Messrs. E. & C. Whitney, of City Road, E., electrical engineers, appealed for James Green, aged 39, classed B3, an electrical fitter, for the third time. Captain Fisher said this was an electrical toy shop, but Mr. Whitney said this man had nothing to do with that; he was doing work for outside customers, wiring, and so on. They could only do work of national importance, as they could not get the materials themselves for private work, and could, therefore, only do the work for firms who got A certificates. Captain Fisher said these men were very badly wanted in the Army, and they were being called up. Mr. Harwood asked why it was that he had not got a M.A.R.O. (Munition Area Recruiting Officer) certificate if he was doing national electrical work, and Mr. Whitney said he did not think there would be the slightest difficulty, as the other men had got it. The hearing was then adjourned for him to get one, and the Chairman said that if he could not do so he might have to go into the Army.

At Accrington Tribunal, the Military Representative appealed for the cancelling of the exemption given to a man of 38, married, engaged on electrical work connected with the making of shells and fuses. Asked as to his exact occupation, the man replied that he was an electroplater. The Town Clerk: You are put down in the papers as an electric "motor." The certificate was cancelled, temporary exemption being given to January 31st.

At Torquay, an appeal was made by J. W. Lane (27, B2), electrical fitter, and he was given until March 1st.

At Lonsdale Appeal Tribunal, the case of an electrical engineer (26) was considered. He was in business with his brother at the outbreak of war, but joined up and served six months, being discharged as medically unfit on the eve of going to France in 1915. His brother went to munitions on his return, and another brother had been on munitions at Sheffield. After being called up for medical examination he passed B3. They had 470 customers, whose electrical instal-

lations of motors required supervision. Colonel Robinson said that such men were needed in the Army. The Tribunal ordered him to join up again on December 31st.

Before the Northants Appeal Court, the Peterborough Electric Traction Co. appealed for J. G. Manning (29, Class A), electrician. The company's representative said that they were given to understand by the Ministry of Munitions that no more men would be taken from the trams, but they had since withdrawn this, and left all appeals to the Tribunal, who would know the local conditions. Manning was the only man left to do repairs, and they had failed to obtain a substitute. Complaints had been made from various munition works that there were not sufficient cars run, and that was because they could not keep up with the repairs. Three months were conceded.

At Gloucester, the County Appeal Court heard a Military appeal against the decision of the Tribunal at Stow respecting an appeal for an electrician (25, B 1), engaged with the Electric Light Co. It was stated that the man was engaged after rejection, and was since classified B 1. The Court considered the man to be indispensable, and, giving exemption until March 31st, requested the employers to do their best in the meantime to replace him.

Lancashire Appeal Court has gone into appeals for 22 employees of the St. Helens & District Tramways Co. Eleven drivers and three inspectors are not to be called up until substitutes are found; another inspector was refused exemption, and temporary exemption until February 8th was allowed to a winder, an armature mechanic, a joiner and S.D., a controller attendant, a handy man, and a fitter's labourer.

At Oxford, Messrs. Wyatt & Son appealed for E. Green (36, C 1), electrician. He is passed for trade only, and Captain Sheild said that if taken for the Army he would be put to his trade. Two months' temporary exemption was allowed.

Essex Appeal Court has granted exemption until January 1st to R. Jefford (18), electrical engineer, of Leyton.

On the recommendation of the Advisory Committee, the Rochdale Tribunal has given exemption until March 31st to H. Smethurst (36, Class A), overhead wireman, appealed for by the Corporation tramway department.

At Northamptonshire Appeal Tribunal, on Monday, Mr. J. Cameron, the manager of the Northampton Corporation tramways, resisted the Military appeal for the open exemption to January 1st, 1918, of G. T. Webb (38, married, B 1), a traffic inspector. Mr. Cameron said Webb had been in the employ of the Corporation since 1901, and the duties of an inspector were much more onerous than they used to be. During the past two and a half years there had been 200 changes in the staff, including the introduction of 120 women conductors, and in view of these wholesale alterations it was absolutely essential that competent inspectors should be in charge. Sir Charles Knightley remarked that some of the cars did not carry anything like their full complement of passengers. Mr. Cameron replied that in the first six months of the present financial year the passengers totalled five and a half millions. The Chairman said there was no reason why tramway traffic should not be reduced, as other traffic had been cut down by the shortage of petrol. The Tribunal would allow the Military appeal to the extent of attaching finality to the certificate.

At the Hull Tribunal, a C 2 man, 33, said that he was an electrician by trade, but owing to an injury to his arm he had acted as a laundry vanman. Recently he had returned to his trade. The Military Representative said that electricians were wanted in the Army, and such men had to be sent to undergo the trade test. The application was refused.

BUSINESS NOTES.

Imports Prohibited.—A Royal Proclamation, dated November 16th, prohibits the importation except under special licence, of the following:—

Brass rod and brass wire,
Electric meters,
Electrical motors over $\frac{1}{2}$ h.p.,
Electric hand lamps and torches,
Magneto's,
Measuring tapes and rules of all descriptions, including verniers,
Micrometers.

An Electrical Works Institute.—We have received a copy of the E.C.C. Works Institute membership card for 1917-18. The Institute is, of course, connected with the Rushbury Wolverhampton Works of the ELECTRIC CONSTRUCTION CO., LTD., being provided for the recreation of the employees. Provision is made for tennis, bowls, billiards, pool, snooker pool, a lending library, physical culture, dancing class, and a holiday savings bank. The rules are delightfully brief, and cannot be described as irksome, for they read thus: "None, except those which ordinarily govern decent conduct and good sport-manship." Mr. W. M. Furniss, the manager, is president, and three of the directors (Messrs. P. E. Beacheroff, chairman; James Gray, managing director; and David Willock) appear as vice-presidents.

Book Notices.—*Lloyd's Diagram of Calculations.* By H. G. Lloyd. London: E. & F. N. Spon, Ltd. Price 2s. 6d. net (2s. 8d. post free).—This is an ingenious diagram, with which multiplication, division, proportion, involution and evolution, &c., can be performed: it is printed on a card measuring $8\frac{1}{2} \times 13$ in., and consists of logarithmic co-ordinates, together with a system of diagonal lines. Scales are printed on the four margins, and by following the lines to their intersections in accordance with the instructions, which are printed on the card, the operations above mentioned can be quickly carried out to a fair degree of accuracy. The divisions of the scale can be read to the third significant figure, giving a possible attainable accuracy of about one part in 1,000, which is maintained over the whole area of the diagram owing to the logarithmic subdivision; we have made various trials of simple operations, the greatest error made being 1 in 1,000. Inspection of the fine lines is somewhat trying to the eyes, and the diagram is, of course, not comparable in convenience with a slide rule: it is, however, easy to use, and certainly is very clever and interesting.

"The Work and Training of the Royal Flying Corps." London: Illustrated London News and Sketch, Ltd. Price 2s. 6d. net.—This work, which was published on Monday last, has been issued on behalf of the Royal Flying Corps, and consists almost wholly of views of the Corps at work, printed in photogravure; the subjects dealt with cover all branches of the Corps's activities, and are exceedingly interesting in themselves, while the reproduction reaches the highest grade of excellence. There is a short introduction by Lord Hugh Cecil, the rest of the issue being pictorial. While it contains little of purely electrical interest, except some views of the training school for wireless telegraphy, the illustrations are of fascinating interest to all admirers of the work of this wonderful organisation, and the volume is well worth the price. A companion volume dealing with the sister service—the Royal Naval Air Service—is in preparation.

"Industrial Engineering, Present Position and Post-War Outlook." By F. W. Lanchester. Presidential address delivered before the Junior Institution of Engineers. London: Constable & Co. Price 1s. net.

"Training and Work of the Chemical Engineer." Reprinted from the *Transactions* of the Faraday Society. Vol. XIII. September, 1917. Price 3s. 6d.

"Science Abstracts, A and B." Vol. XX. Part 10. No. 238. October 31st, 1917. London: E. & F. N. Spon, Ltd. Price 1s. 6d. each.

Standardisation of Petrol Gauze.—At the instance of the Air Board, the Royal Aircraft Factory experts have made experiments, which have resulted in a standardised gauze being agreed upon. This will greatly facilitate manufacture, and will enable the material to be produced in Great Britain in adequate quantities to meet the demands from aircraft factories. The gauze will be known as "Air Board Standard Petrol Gauze," and all orders and inquiries should be sent to the Air Board Office, S. (H.A.) 5, Room 609, Strand, W.C. 2.

British Magneto's for British Users.—As a result of co-operation on the part of the members of the British Ignition Apparatus Association, purchasers of magneto's made by them will enjoy the many advantages which arise from standardisation in production. The complete magneto's are interchangeable, not only with one another, but with the best-known pre-war types, for every one of which there are now one or more British magneto's of similar purpose and capacity. Further, many of the essential parts are standardised and interchangeable. Screws, for instance, will be used of standard dimensions, and the different sizes of brushes are being standardised and reduced in number to one-tenth. Other parts are being dealt with in a similar way. This means, first, that spare parts will be much cheaper; secondly, that they will be easily and quickly procurable, because agents and garage proprietors will be able to supply from stock. The advantages thus secured are increased by the fact that certain firms are concentrating on particular types in order to secure for the public the benefits which arise in efficiency and economy from quantity production.

The following list of British standard types of magneto's for the motor trade shows the corresponding pre-war types—where such exist—and the number of British firms now making them:—

British standard type.	Size and purpose.	Pre-war type.	Now being made by—
M.1	1-cyl. light weight motor cycle	Z.A.1	4 British firms
M.2	2-cyl. opposed motor cycle	Z.A.2	3 British firms
M.V.	2-cyl. V. light weight motor cycle	Z.A.V.	1 British firm
K.1	1-cyl. standard $3\frac{1}{2}$ h.p. motor cycle.	Z.E.1	4 British firms
K.V.	2-cyl. V. $6\frac{1}{8}$ h.p. motor cycle	Z.E.V.	2 British firms
K.2	2-cyl. (opposed) $6\frac{1}{8}$ h.p. motor cycle.	Z.E.2	2 British firms
G.1	1-cyl. for light cars	Z.F.1	4 British firms
E.1	1-cyl. for large cars and lorries	Z.U.4	5 British firms
E.6	6-cyl. for cars and lorries	Z.R.6	4 British firms

All of these types are being supplied in large quantities to the British and Allied Governments.

In addition, there are full ranges of standardised British magneto's for aero, stationary, and marine engines, for agricultural work, and for all kinds of gas engines.

Spain.—The Sociedad Lamparas Rex has been formed at Barcelona, with a capital of 50,000 pesetas, for the manufacture of electric glow lamps.

Italy.—With its seat at Genoa, a joint-stock company has been established under the style of the *Fabbrica Nazionale Lampade Elettriche ad Incandescenza*, having for its object the manufacture and sale of electric glow lamps and kindred accessories. The capital of the company is 60,000 lire.

Trade with Italy.—The British Chamber of Commerce for Italy (Inc.), Genoa, in its latest list of openings for British articles in Italian markets, mentions the following :—

No. 1,436.—Travelling representative would take up agencies for Italy and Colonies for beltings, lubricants, engineering articles in general, small machinery, machine tools, ironmongery, steel, household articles, &c. A.G.V.

No. 1,439.—Engineering office at Genoa would import for own account or on commission :—Machinery for steel works and rolling mills, machine tools for large engineering and shipbuilding works. G.F.S.A.

British Industries Fair.—As certain Trade Associations connected with trades eligible to participate in the British Industries Fair, 1918, have until recently been unable to hold meetings to discuss concerted participation, and in order to suit the convenience of a section of the Trade Press, the Board of Trade have decided to extend the final date for the receipt of applications for space until November 30th. The difficulties of organisation due to the war make it of the highest importance, however, that all applications should be sent into the Director, British Industries Fair, 10, Basinghall Street, London, E.C. 2, at the earliest possible moment. The applications for space so far received from manufacturers point to the coming Fair being greatly increased both in size and importance.

Catalogues and Lists.—THE PARSONS MOTOR CO., LTD., Town Quay Works, Southampton.—Seventy-two-page catalogue giving full information respecting their marine and stationary oil engines. Stationary petrol-electric sets, from 7 H.P. to 90 H.P., are detailed with price, code-word and shipping particulars. This side of the firm's business has been largely developed during the last few years.

MESSRS. VICKERS, LTD., 57, Victoria Street, Westminster, London, S.W. 1.—A series of excellently produced foreign publications. The first gives a description, also a full specification, in English, of Vickers rotary converters. The second describes the same plant in French. The third (of 30 pages) gives the same information in Russian. The fourth (24 pages) covers the ground in Spanish. Three separate publications of four pages each deal briefly in English, French and Russian, and with illustrations charmingly executed in colour, with the firm's electric crane equipments (motors, controllers, resistances, brake magnets and switchboards). These publications are prepared in such a creditable style as to make a substantial impression upon the recipient, a merit which, for foreign trade, can hardly fail to bring its reward. For all of them a thick art paper is used, and half-tone illustrations and diagrams are effectively printed.

France.—Under the style of "Automatisme et Appareillage," has been formed at Paris, a company for the development of the business of electric switches and the taking up of all patents, licences, and industrial processes relating to automatic apparatus. The capital of the company is 150,000 fr.

Dissolutions and Liquidations.—MICA MANUFACTURING CO., Volta Works, Cazenove Road, Stoke Newington.—R. G. Whiffen has retired from the partnership, which has been dissolved. Messrs. P. Freeman, T. J. Sack and G. H. Hadder will attend to debts, &c.

KORTING BROS., LTD.—A meeting is called for December 21st, at 53, Victoria Street, S.W., to hear an account of the winding up from the liquidator, Mr. A. G. Parker.

Trade Announcements.—We are informed that the Board of Trade have now given formal sanction to a new company, with works in London and Liverpool, and known as the *BRITISH BARIMAR-THERMIT WELDING CO., LTD.*, to take up and exploit the Thermit welding process, which, prior to the war, was exclusively in German hands. Thermit is especially applicable for tramway welding and for the repair of heavy castings and machine parts, and it is the intention of Mr. C. W. Brett, the managing director and general manager of Barimar, Ltd., scientific welding engineers (who is largely responsible for the formation and management of the new company), to train disabled British soldiers and sailors to carry on the work. The registered offices of the new company are at 10, Poland Street, London, W. 1.

With reference to the above, we are also asked to point out that the above company must not be confused with Thermit, Ltd., 675, Commercial Road, London, E. 14, who are the owners of the Alumino-Thermit Process Patents, and in no way connected with the new company above referred to, who merely hold a licence to work certain of the patents belonging to Thermit, Ltd. Messrs. Thermit, Ltd., were originally established in 1904, and about 18 months ago the whole of the shares were sold to the Birmingham Metal and Munitions Co., Ltd., Birmingham. Thermit, Ltd., continue their manufacture of various Thermit compounds, and are at present especially engaged upon the manufacture of certain metals and alloys in connection with munitions of war.

The Caxton House offices of the *IMPERIAL UNITED LAMP CO., LTD.*, having been commandeered by the Government, their new address is Thanet House, 231-2, Strand, London, W.C. 2. Telephone number: Central 3016-7-8. Telegraphic address: "Unilamcom, Estrand, London."

LIGHTING AND POWER NOTES.

Acton.—The Finance Committee is protesting against the continuance of increased charges in the area by the Metropolitan Electric Supply Co. The latter considers that no reduction can be made under present conditions, and states that the total profit earned by the Acton undertaking from 1911 to 1915, inclusive, was barely sufficient to meet depreciation. It was decided to acquaint the company with the Council's views, before taking other steps to have the increased charges modified.

Ashton-under-Lyne.—PRICE INCREASE.—The Electricity Committee proposes to increase the charges for electricity after the next quarter, owing to the increased cost of coal, wages, &c. The extent of the increase has not yet been fixed.

Australia.—Murrumburrah (N.S.W.) Council has decided to install an electric lighting plant, and is obtaining plans and estimates of a suitable scheme.

Barnes.—The Electricity Committee, in recommending the laying of a new cable to a local works, suggests that the firm pay £2,000 as part cost of the installation and pay the Council's current rate for power supply in the district, the firm to take a minimum supply of 500,000 units per annum for five years, and, instead of paying down the £2,000, to give security for payment and pay in addition to the charges mentioned above a charge of 1½d. per unit, until the sum of £2,000, together with interest thereon, is paid.

The Electricity Committee recommends the following revised electricity charges :—Lighting, 4½d. per unit; heating and power, 1½d. per unit; that all lighting charges be abolished, and that the alternative rateable value tariff be 1½d. and 1d. instead of 1d. and ¾d.

The increased coal prices under the recent award represent an additional cost of £2,000 a year.

The electrical engineer reports that the maximum load to be handled this winter is expected to be not less than 1,300 kW., and as the total capacity of the plant installed is 1,750 kW., the margin of safety has long been passed. The Committee has decided to consider a special report as to the provision of additional plant for immediate use.

Belturbet (Co. Cavan).—STREET LIGHTING.—The public electric lighting contract has been taken up by Mr. J. Stewart, at £70 for the season.

Brimington.—The P.C. has under consideration a co-operative scheme for electric lighting in this village.

Bradford.—WAGES.—The Corporation War Wages Committee, in response to an application on behalf of over 3,000 workers in various departments, including the electricity department, has decided to increase the men's war bonus from 12s to 15s. per week, and that of the women from 6s. to 8s.

Deal.—The Board of Trade has extended for a year the powers relating to certain distributing mainlaying under the Deal and Walmer Gas and Electricity Act, 1911.

Derby.—The Electricity Committee has appealed to consumers to economise in the use of electricity during heavy load periods.

Dundee.—A suggestion was made at a meeting of the Corporation Committee that Mr. Richardson, the burgh electrical engineer, who is at present on Active Service, should be demobilised. It is explained that the department cannot take on any new consumers just now, and that it will require another great extension of the works. It was pointed out that the makers of generating machinery were getting full up with orders for after the war, and Dundee might have to wait for two or three years. A Sub-Committee is considering the matter.

Halifax.—WAGES.—The award of the Committee on Production, after arbitration on the demand of workmen in certain departments—including the electricity department—is for a further advance of 3s. per week to adults, making a total of 12s. above pre-war rates. Youths under 18 years of age are awarded 1s. 6d. a week advance.

Hove.—Owing to inability to obtain apparatus, material, and labour, the T.C. has decided, until further notice, to take no orders for the supply of electricity for radiators, heaters and cookers. Only a limited number of orders for new supplies for lighting will be accepted, and then only where the length of new mains required is very short, and this not to include a road crossing.

Hucknall.—ELECTRICITY SCHEME.—The Sherwood Co. has informed the Council of its willingness to supply the town with electricity, but in view of the fact that the Nottingham Corporation has decided not to proceed with its prov. order this session, it was decided that the Council's scheme should not be proceeded with until after the war. A Sub-Committee was appointed to take the necessary steps.

Kingston-on-Thames.—YEAR'S WORKING.—At the last meeting of the Council, the Lighting Committee reported that it had considered an offer from Edmundson's Electricity Corporation, Ltd., to take over the Corporation electricity works, and recommended that it be not entertained, but that if the company makes

a more satisfactory offer the Corporation will give it careful consideration.

The twenty-third annual report of the borough electrical engineer, Mr. J. E. Edgcombe, for the year ending March 31st last shows a deficit on the year's working of £6,790, as compared with a deficit for the previous year of £629. The principal reason for this deficit is the greatly increased cost of fuel owing to the larger proportion of coal which has been consumed compared to fuel oil, as on account of the fracture of the crankshaft of the two-cycle Diesel engine that plant was out of commission during the whole of the year and the larger portion of the units supplied were generated by steam plant. The comparison of the quantities generated is set out herewith:—

	1915-16.	1916-17.
Units generated by coal ...	181,987	757,980
Units generated by fuel oil ...	974,220	492,605
Total ...	1,156,207	1,250,585

The 757,980 units generated by steam cost in fuel £8,265, equal to 2'617d. per unit, while the 492,605 units generated by the four-cycle horizontal Diesel plant cost in fuel £865, equal to 0'421d. (or less than ½d.) per unit. The cost per unit generated increased from 3'622d. in 1915-16 to 4'618d. in 1916-17, while the receipts per unit sold declined from 3'491d. in the previous year to 3'311d. in 1916-17. The number of consumers totals 1,953, an increase of 78: the total of lamps, motors, heating, cooking, and other apparatus in terms of 32-watt lamps connected to the mains has increased to 90,312. The amount of capital expenditure outstanding at March 31st last was £66,132: the total capital expenditure on the undertaking has been £130,700. On three occasions only has there been any credit balance (amounting in the aggregate to £1,682), whilst in the other 20 years the deficits have totalled £27,217, showing a net demand on the ratepayers of £25,535. The Council decided that, having regard to the adverse balance appearing in the report and balance-sheet, 1½d. per unit be added to the existing scale for power in lieu of the increase of 20 per cent. on the scale, as from December 1st. — *Surrey Comet*.

Leeds.—PRICE INCREASE.—The Electricity Committee has decided to recommend an increase in the charges for electricity by 10 per cent., to date from April 1st next.

Lincoln.—PRICE INCREASE.—The T.C. has increased the price of current to consumers, other than those for power under agreement, by 10 per cent., as from the reading of the meters for the September quarter accounts; and has asked consumers under agreement to pay 5 per cent. increase.

London.—POPULAR.—The Finance Committee reports the sanction of the L.C.C. to the borrowing of £27,825 for a new turbo-alternator and accessories, and that the County Council is prepared to advance the amount at 5½ per cent. interest.

The Electricity Committee reports a deficiency on the working of the electricity undertaking for the June quarter of £1,106, as against a surplus of £1,715 in the corresponding period of last year.

Owing to the advance in the price of coal, the Committee recommends a further advance of 15 per cent. on pre-war charges for power and public lighting from November 30th next, and 10 per cent. advance on private and domestic supplies from January 1st next. The electrical engineer recommends the provision of two additional 1,000-KW. converters for sub-stations.

The Committee has considered the resolution of the Wages Conference of local authorities owning electricity undertakings in Greater London, and recommends the adoption of the award of 15s. increase upon the pre-war wage to all employés affected by the awards of the Committee on Production, and to the technical staff, to date from September 1st, such 15s. to be inclusive of any increase granted since August, 1914, as war bonus or war wages.

The Hammersmith and Battersea B.C.s have also adopted the above award.

HAMMERSMITH.—Owing to the demands for electricity in the northern part of the borough, and especially at the White City, negotiations have been entered into with the Kensington and Notting Hill Co. for a supply of three-phase E.H.T. current, which the company is prepared to furnish at the rate of 9d. per unit. The total capital cost, including transformers, will be about £1,500.

The Electricity Committee recommends the appointment of an additional engineer-in-charge at the generating station, with the object of improving the supervision to be exercised over the repairing staff.

The Committee reports that the B. of T. award in the matter of the linking-up scheme between Fulham, Hammersmith, and Battersea is as follows:—

The cost already incurred by the Battersea and Fulham Councils to be borne in equal proportions by all three Councils.

The cost of the main or mains required to be laid between the generating stations of the Fulham Council and the Hammersmith Council to be borne:—

1. As to the amount that the said main or mains would have cost had the agreement which was negotiated in 1915 been completed and the said main or mains had been laid in pursuance therefrom by the Battersea Council, the Fulham Council, and the Hammersmith Council respectively in equal proportions; and

2. As to any excess over that amount, in the following proportions—that is to say by the Battersea Council one quarter, by the Fulham Council one quarter, and by the Hammersmith Council one half.

The award of the B. of T. settles the question of the proportions

in which the cost of laying the connecting main throughout the whole length from Battersea to Hammersmith shall be borne. This point having been settled, the Committee has authorised the town clerk to communicate with the Battersea and Fulham Councils with the object of completing the negotiations.

The Finance Committee recommends that application be made to the L.C.C. for sanction to the borrowing of £3,000 for transformers, &c.

WOOLWICH.—The B.C. has, owing to the continued increase in the price of coal and the abnormal rise in working costs, increased the charges for energy by 1½d. per unit net for lighting other than for factory use, by ½d. per unit for power users under £200 a year, and ¾d. for power users beyond that value; the increases are not to apply to consumers with a coal clause in their contracts.

Londonderry.—The Corporation has decided to seek Parliamentary powers for the development of the electricity undertaking.

Lynn.—PRICE INCREASE.—The Electricity Committee recommends that the charges for lighting be increased by ½d. per unit, and for power and heating by 7½ per cent.

Meltham.—PROPOSED PROVISIONAL ORDER.—The U.D.C. has received offers from the Huddersfield Corporation and the Yorkshire Electric Power Co. to supply electricity in the area of the township. The terms of the Corporation are 10 per cent. above the rates in the borough, but the company has not given any definite terms. At an interview between a deputation appointed by the U.D.C. and the Corporation, it was pointed out that though the Corporation was anxious to supply electricity, it did not agree to run electric cars even if electric power was supplied to the Meltham area. At the same time, however, if the Corporation secured the supply of electric power, this would be an inducement to consider favourably the question of running cars to Meltham at some future date. The U.D.C. has approved the report of the deputation, and decided to support the Huddersfield Corporation in taking the necessary steps to obtain a Provisional Order for carrying out the work. Since the Council meeting a communication has been received that the B. of T. cannot allow the application for the Provisional Order to proceed in the ensuing session, owing to the political situation.

New Zealand.—Waihi B.C. has decided to negotiate with the Waihi Gold Mining Co. for a supply of electricity for street lighting from the Horahora power plant.

Licences have been granted to the Hamilton and Patea B.C.s to install electrical systems for lighting and power.

Rotherham.—PROV. ORDER.—The Corporation has given notice of its intention to make application to Parliament in the ensuing session for an Act, among other proposals, to confirm an agreement between the Mexborough and Swinton Tramways Co. and the Corporation for the transfer to the Corporation of the Tramway Co.'s electricity undertakings, authorised by the Rawmarsh Electric Lighting Order, 1898, the Swinton Electric Lighting Order, 1899, and the Mexborough and Swinton Tramways Acts, 1902 and 1905; to empower the Corporation to supply electricity to the Tramway Co. in bulk or otherwise, and to extend the area of the Corporation for the supply of electricity, so as to include (in addition to the borough and the urban districts of Rawmarsh and Swinton) the urban district of Greasborough, the rural district of Rotherham, and the parish of Ecclesfield, in the rural district of Wortley.

St. Helens.—The income of the electricity department for the past year amounted to £40,656, and the expenditure to £41,158, leaving a deficiency of £501.

Southport.—Improvements effected at the Corporation electricity works during the past three years in connection with the fuel plant, have resulted in a reduction of the amount of fuel used by 50 per cent. But for this the price of energy would have been considerably increased.

Stockbridge.—PROV. ORDER.—The U.D.C. proposes to apply to the B. of T. for a provisional order for electricity supply within the urban district.

Stratford-on-Avon.—The Electricity Committee has refused the request of the Electricity Co. for permission to increase the charges for energy, and the Council has confirmed this decision.

Tasmania.—The *Hobart Mercury* says that the State Government intends to create a Water Commission to control the water supplies of the island, concerning which reports are at present being obtained.

Walsall.—The local Chamber of Commerce has passed a resolution expressing concern at the 20 per cent. increase in electricity charges. A member of the Electricity Committee defended the increased charges, which were necessitated by the increased expenses of the undertaking.

W. Yorks.—PROVISIONAL ORDERS.—The Electrical Distribution of Yorkshire, Ltd., is proposing to apply to the B. of T. for Provisional Orders for electricity supply in Luddenden Foot and Mytholmroyd.

TRAMWAY AND RAILWAY NOTES.

Argentina.—**RAILWAY ELECTRIFICATION.**—At the annual meeting, last week, of the Central Argentine Railway, Sir Archibald Williamson, Bart., M.P., stated that they had only about one-third of their suburban electrified undertaking equipped and working; the other two-thirds, when circumstances permitted of their being finished, would cost a small sum as compared with the first section. Although the main-line passenger traffic showed decreases, they had increases in suburban traffic wholly due to that part of the line where electric traction was in use.

Australia.—On the second reading of the Victorian Government's Melbourne and Metropolitan Tramways Authority Bill, Sir Alexander Peacock (the Premier) said that on a date to be fixed the duties of the Melbourne Tramways Board would pass to the new authority under the Bill, and not more than six months later the following would be taken over by the authority: The Prahran and Malvern Tramways Trust, the Hawthorn Tramways Trust, the Melbourne, Brunswick, and Coburg, Fitzroy, Northcote and Preston, South Melbourne, Footscray, and Melbourne and Essendon tramway systems. Power would also be given to lease or acquire the St. Kilda-Brighton and Sandringham and Black Rock street railways. One controlling authority would mean economy, and any extensions would then be carried out in accordance with a general plan.

The tramway area would be divided into 12 districts: each would return one member to the Board, while the chairman and one other member would be nominated by the Governor in Council. The working expenses, interest, &c., would be apportioned to the car-mileages of the various systems. The members of the Board appointed by the Governor in Council would hold office for five years, the other members would be elected for three years.

The authority, with the consent of the Governor in Council, could borrow up to £750,000, exclusive of any principal sums transferred to it from the existing authorities. One of the first duties of the authority would be to prepare a general scheme for the future development of metropolitan tramways. Any new tramway services would be considered in connection with the services provided by the suburban railways. Out of the tramway revenue every year was to be paid a sum to be determined to recoup the loss caused to the railways by any tramways of the authority constructed within five years before the commencement of the Act, or constructed thereafter, and the construction of which was objected to by the Railway Commissioners.

When the Melbourne and Essendon tramway and electrical undertakings were acquired, the authority must have power to operate them. For this and other undertakings the authority would be authorised to purchase, generate, and supply electricity—and to supply it to municipalities to light any roadways along which the authority's tramways ran. Before the erection of new power houses and installation of new electric plant by the authority the approval would be necessary of the Railway Commissioners, or such body as Parliament decided would control metropolitan electric supply. The principal electric supply undertakings were controlled by the Melbourne Electric Supply Co., the City Council, and the North Melbourne Electric Tramway and Lighting Co., Ltd. The tramway authority might acquire a Council's undertaking by agreement, and a private undertaking either by agreement or compulsorily. The capital cost of the undertaking was to be the basis for municipal rating. Capital cost of the works and undertakings would be on the original construction cost, and the rateable capital cost would be the capital cost of so much of the authority's properties as were rateable to municipalities.—*Australian Mining Standard*.

Birmingham.—The number of passengers on the tramways has increased by over half a million per week as compared with this time last year. The increase last week was 859,360. Mr. Harrison Barrow, the chairman of the Corporation Tramway Committee, states that when the war is over the following schemes should engage immediate attention:—Tramway track repairs, provision of single-deck cars with trailers (the experiment has been thoroughly successful), the construction of the lines authorised in the 1914 Act, to show the advantage of the separate track, and the extension of the system for carrying heavy goods.

Blackburn.—**FEMALE DRIVERS.**—The quarterly meeting of the Lancashire and Cheshire Tramways Managers' Association was held at Blackburn on November 16th. Mr. J. H. Cowell, manager of the Corporation tramways, presiding. During the transaction of business several topics were discussed, considerable interest being taken in the question of the suitability of female drivers; Blackburn was one of the pioneers in this matter. The delegates were given a practical demonstration of the efficiency of such drivers by Miss Nellie Sharratt, who drove the delegates over certain routes, during which a call was made at the depot at Intak, which was thoroughly inspected.

Continental.—**ITALY.**—The Società Anonima Idroelettrica dell'Appennino has been formed at Bologna, with an initial capital of 1,000,000 lire, and an eventual capital of 6,000,000 lire, for the utilisation of the water-power of the Apennines for the electrification of railways and tramways. An influential council of administration has been nominated.

India.—**RAILWAY ELECTRIFICATION.**—According to the *G.I.P. Magazine*, for some time past the question of electrifying parts of the G.I.P. system has been under consideration, and

although nothing definite has been decided upon it is highly probable that on the conclusion of the war an electrification scheme will be carried out.

London.—**CENTRAL LONDON RAILWAY.**—The B. of T. has extended by one year the time under the Central London Railway Act, 1913, relating to the construction of certain railways and works.

Musselburgh.—At the local Town Council the condition of the electric tramways came in for criticism, surprise being expressed that the B. of T., to whom the Council had addressed several complaints about accidents on the tramway system, had written that "the responsibility for the proper maintenance of the tramway undertaking rested with the promoters, and that the Board did not carry out any system of periodic inspection of tramways." It was suggested that Edinburgh T.C. might be approached, to consider taking over system, but no motion was made.

Tramway Workers and Christmas Holiday.—Members of the Amalgamated Association of Tramway and Vehicle Workers are agitating for a general holiday on Christmas Day. It is stated that a request has been sent to all the tramway concerns in the country asking for this concession. Some Tramway Committees are in favour of granting the request, but a good many are against, amongst the latter being Manchester and Salford. The employees, however, are going forward with the movement.

Wharfedale.—**RAILLESS TRACTION.**—The Otley T.D.C. is in negotiation with the Councils of Guiseley and Menston with a view to sending a joint deputation to Mr. J. B. Hamilton, the Leeds tramway manager, to try to secure a better service of the railless cars in Wharfedale and the erection of shelters at the exposed country termini.

TELEGRAPH AND TELEPHONE NOTES.

Brazil.—The Government has opened a credit of 1,000,000 milreis to complete the work of establishing new radio-telegraphic stations and increasing the telegraphic lines for the Army and Navy.

Unknown persons have attempted to set fire to the radio-telegraphic station connecting Monte Babilonia with Rio de Janeiro.—*Financier*.

United States.—The War Income-Tax Bill, which took effect on November 1st, places a tax of 5 cents upon each telegraph, telephone, or wireless message or conversation which originates within the United States, and for the transmission of which a charge of 15 cents or more is imposed.—*T. and T. Age*.

CONTRACTS OPEN AND CLOSED

OPEN.

Australia.—**PERTH.**—December 5th and 12th. Postmaster General's Department. Telegraph and telephone instruments and parts, battery material and telephone switchboards, parts, &c. See "Official Notices," November 16th.

ADELAIDE.—December 12th. P.M.G.'s Department. Telephone material. Schedules 478 to 482. See "Official Notices" to-day.

Carlisle.—December 11th. Electricity Department. One 1500/2000 KW. turbo-alternator and one surface condensing plant. See "Official Notices," November 16th.

Enniskillen.—December 1st. Sligo, Leitrim & Northern Counties Railway Co. Telegraph material for 12 months. Mr. J. Duff, Secretary, Enniskillen.

France.—**LYONS.**—Tenders are invited for the supply of two batteries of accumulators of 12 elements each (capacity 1,080 ampere-hours), and of sundry machines (motors, dynamos, switchboards, &c.) for the central telephone exchange at Lyons. Particulars from the Direction des Postes et Télégraphes du Rhône, 33, bis, Rue Vauveconr, Lyons.

Grimsby.—November 30th. Electricity Department. Twelve months' supply of coal. Deputy Electrical Engineer.

Manchester.—December 12th. Three fan draught cooling towers at the Stuart Street station, for the Electricity Committee. See "Official Notices," November 16th.

Rathmines.—November 28th. U.D.C. 500 tons of coal for the electricity works. Electricity Engineer.

CLOSED.

Bury St. Edmunds.—T.C. 100 tons of 2-in. Mapperley slack coal, for the electricity works; Carr Bros. & Co., 25s. per ton.

Government Contracts.—List of new contracts placed October, 1917:—

WAR OFFICE.

Dynamos, switchboards, &c.—Lancashire Dynamo Co., Ltd.
Generating sets and spares.—Austin Motor Co. (1914), Ltd.; Coventry Simplex Engines, Ltd.; Electric Construction Co., Ltd.; R. A. Lister and Co., Ltd.; Phoenix Dynamo Manufacturing Co.
Insulators (field).—Bullers, Ltd.; F. W. Cotterill, Ltd.
Petrol-electric vehicles.—Stevens Petrol-Electric Vehicles, Ltd.
Motors.—E. Brook, Ltd.; Crypto Electrical Co.; Macdonald, Syer & Co., Ltd.; F. Parkinson & Co.
Works services "electrical."—Parsons Motor Co.

INDIA OFFICE STORE DEPARTMENT.

Accumulator plates.—Chloride Electrical Storage Co.
Bells.—Peel-Comer Telephone Works, Ltd.
Cells.—General Electric Co., Ltd.
Fittings for telephone parts.—Siemens Bros. & Co.
Wire.—R. Johnson & Nephew; Johnson, Matthey & Co.

H.M. OFFICE OF WORKS.

Engineering services.—Barry Dock Grain Stores electric generating plant; Crompton & Co., Ltd.
Cardiff Grain Stores electric supply.—Harland Engineering Co.
Avenmouth, Barry, Cardiff, and Newport conveyor weighing plant.—Spencer & Co.
Grain Stores generally, flexible cables.—B.I. & Helsby Cables, Ltd.
Ordnance Survey Office Overseas.—Electrical motors and starters; Crompton & Co., Ltd.
Swansea King's Dock.—Electric light and power wiring; Lund Bros. & Co.
Key switch holders.—General Electric Co., Ltd.

POST OFFICE.

Protective apparatus.—L. M. Ericsson Manufacturing Co., Ltd.
Telegraph apparatus. Automatic Telegraph Manufacturing Co., Ltd.; India-Rubber, Gutta-Percha, and Telegraph Works Co., Ltd.
Telephone apparatus.—British L. M. Ericsson Manufacturing Co., Ltd.; Peel-Comer Telephone Works, Ltd.; Western Electric Co., Ltd.
Insulator covers and bodies.—Bullers, Ltd.
Submarine cable.—Siemens Bros. & Co., Ltd.; Telegraph Construction and Maintenance Co., Ltd.
Telegraph cable.—B.I. & Helsby Cables, Ltd.; Callender's Cable and Construction Co., Ltd.; Connolly Bros., Ltd.; W. T. Glover & Co., Ltd.; Henley's Telegraph Works Co., Ltd.; Johnson & Phillips, Ltd.; Union Cable Co., Ltd.
Telephone cords.—London Electric Wire Co. & Smiths, Ltd.; Western Electric Co., Ltd.
Telephone plugs.—Automatic Telephone Manufacturing Co., Ltd.; British L. M. Ericsson Manufacturing Co., Ltd.; Western Electric Co., Ltd.
Telegraph poles.—Bullers, Ltd.
Insulator spindles.—Bayliss, Jones & Bayliss, Ltd.
Telephone terminals.—D. Gibson & Co., Ltd.
Bronze wire.—T. Bolton & Sons, Ltd.; B.I. & Helsby Cables, Ltd.; F. Smith & Co., incorporated with the London Electric Wire Co. & Smiths, Ltd.
Galvanised iron wire.—R. Johnson & Co., Ltd.; Shropshire Iron Co., Ltd.; F. Smith & Co., Wire Manufacturers, Ltd.; Whitecross Co., Ltd.

Sunderland.—T.C. Tenders accepted:—

Dewhurst Engineering Co., Sheffield.—Steel tubes.
Minton & Hollins, Ltd., Stoke-on-Trent.—Tiles.
B.I. and Helsby Cables, Ltd.—E.H.T. box compound.

FORTHCOMING EVENTS.

Institution of Electrical Engineers (Student's Section).—Friday, November 23rd. At 7 p.m. At the City and Guilds (Engin.) College, Exhibition Road, Kensington, S.W. Opening meeting. Address by Sir Oliver Lodge, F.R.S., on "Astronomical Applications of the Electrical Theory of Matter."

Manchester Local Section.—Tuesday, November 27th. At the Engineers' Club. At 7 p.m. Paper on "Gas Firing Boilers," by Mr. T. M. Hunter.

Junior Institution of Engineers.—Friday, November 23rd. At 39, Victoria Street, S.W. At 8 p.m. Paper on "Housekeeping in Workshops," by Mr. D. W. Woods.

Physical Society of London.—Friday, November 23rd. At 5 p.m. At the Imperial College of Science, South Kensington, S.W. Ordinary Meeting.

Royal Society of Arts.—Wednesday, November 28th. At 4.30 p.m. At John Street, Adelphi, W.C.2. Paper on "Aerial Transport after the War," by Mr. G. Holt Thomas.

Greenock Electrical Society.—Thursday, November 29th. At 7.45 p.m. At 24, West Stewart Street. Open night for discussion.

Institution of Municipal and County Engineers.—Friday, November 30th. At 5 p.m. At Burlington House, Piccadilly, W. Discussion on the "Supply of Power or Fuel to Vehicles on Public Highways."

Institution of Mechanical Engineers.—Friday, November 30th. At 6 p.m. At the Institution of Civil Engineers, Great George Street, S.W. The Thomas Hawksley "Lecture on Heat Engines," by Capt. H. Riall Sankey, C.B., R.E.

Salford Technical and Engineering Association.—Saturday, December 1st. Visit Manchester Corporation Hydraulic Pumping Station. At 7 p.m. At the Royal Institute. Annual Meeting.

NOTES.

The Red Book.—In consequence of the increased cost of production and other difficulties due to the war, the proprietors of this Electrical Directory do not propose to issue the usual annual edition, at least until more normal conditions obtain.

Whist Drive.—The annual whist drive and dance arranged by the employees of the Blackpool Corporation electricity and tramways department took place on November 15th, and proved very successful. Between 2,000 and 3,000 people were present.

Belfast Electrical Employees' Award.—The following award in respect of the difference between the Belfast Corporation and the Electrical Trades Union with regard to certain men formerly in the employment of the Corporation has been issued:—

- The Committee on Production, to which the matter was referred, finds:—
1. That the transfer of the work of overhead tramway line maintenance from the electricity department of the Corporation was part of a *bona fide* scheme of reorganisation which the Corporation were entitled to carry out.
 2. That the employment by the Corporation of skilled electricians to do the work of overhead line maintenance during the period whilst that work was in charge of the electricity department did not debar the Corporation from adopting, and that they were entitled to adopt, after the transfer to the tramways department, the practice followed by many tramway authorities in different parts of the country of employing linesmen or handy men to do the work of overhead line maintenance.
 3. That the dismissal of the seven men concerned in this reference along with other men who were discharged at the same time was carried out in consequence of the improved organisation adopted, and was not carried out merely with a view to reduce the wages of the seven men concerned.
 4. That the contract of service of the seven men concerned was duly terminated on August 23rd, 1917, after adequate notice, and the men were not illegally dismissed.
 5. That the claim for reinstatement of the seven men concerned has not been established.
 6. That in consequence of the pending dispute as to the respective rights of the Corporation and the men concerned, the men had some reasonable ground for claiming that termination of their conduct of service should be suspended until the difference were settled by arbitration, and the Committee think that on this ground the Corporation should pay, and they award that they do pay, wages at the rates in operation on August 23rd, to the seven men concerned up to the date of this award.

Legal.—**BOSCH MAGNETO CO., LTD.**—The Board of Trade petitioned, in the Chancery Division, on Tuesday, before Mr. Justice Younger, for the winding up of the Bosch Magneto Co., Ltd., under the Trading with the Enemy (Amendment) Act, 1916.

Mr. Austin Cartmell, who supported the petition, said this was as German a company as they well could have. At the outbreak of the war over 49,900 of the shares were held by Germans and 50 by one gentleman in London. This was essentially a German-owned company, and it was formed for the purpose of carrying on a German business. Messrs. Bosch & Klein and the English gentleman to whom he had referred were the only directors. After the outbreak of war the German directors transferred certain large powers to the English gentleman. The company had now been ordered by the Board of Trade to be wound up. The funds now in the hands of the Controller amounted to nearly £200,000. There were certain questions affecting the London Corporation which could only be dealt with in the winding up of the company.

Mr. Galbraith said the London Corporation claimed to be creditors for a very considerable amount, and they desired that the winding up should take place at an early date.

His Lordship made the order.

Foreign Trade.—**OCTOBER FIGURES.**—The official returns of imports and exports during last month contain the following electrical and machinery figures:—

	October, 1917.	Inc. or dec.	10 months, 1917. Inc. or dec.
IMPORTS.			
Electrical goods ...	111,272	- 24,294	- 214,249
Machinery ...	914,756	+ 363,117	+ 299,804
EXPORTS.			
Electrical goods ...	216,687	- 118,101	- 1,003,983
Machinery ...	1,441,594	- 379,335	+ 17,321

Parliamentary.—The following applications for Parliamentary powers appeared in the *London Gazette* for November 20th:—

Leicester Corporation.—Electric lighting prov. order covering various powers.
Crompton U.D.C.—Electric lighting prov. order, bulk supply from Oldham Corporation.

Royton U.D.C.—Electric lighting prov. order, bulk supply from Oldham Corporation.

Greasborough (near Rotherham) U.D.C.—Electric lighting prov. order, powers to take bulk supply.

Braintree.—Crittall Manufacturing Co., Ltd.—Electric supply prov. order for urban district, bulk or otherwise.

I.E.E. Discussion on the Metric System.—As the subject of the metric system was fully discussed at the Institution of Civil Engineers in the early part of the year, more especially from the standpoint of the relative merits of that system and the British, we are informed that the main object of the I.E.E. discussion, which is to take place on Thursday, December 13th, is to consider the effect on the British electrical trade of the introduction of the metric system at the present time, more especially in those markets in which the British system is at present in vogue, with a view to determining whether the compulsory introduction of metrical measures should be pressed for or resisted. It is hoped that it may be found possible to take steps after the discussion to obtain some authoritative pronouncement on the matter from the trade as a whole that will put an end to the present hesitating and unsatisfactory attitude towards the question.

The L.C.C. Education Committee has revoked its recommendation in favour of the compulsory introduction of the metric system.

Control of Tramway Labour, &c.—In connection with the B. of T. Committee on Tramway Labour and Materials, the Executive Council of the M.T. Association has nominated Messrs. A. R. Fearnley, J. B. Hamilton, and J. M. McElroy to serve on that Committee; Mr. A. L. C. Fell will represent the L.C.C. tramways, and two members will be nominated by the T. and L.R. Association to represent, principally, company undertakings, while the chairman, Mr. Jas. Devonshire, has been nominated by the Board of Trade.

Inquiry.—Makers of the "Acme" engine governor are asked for.

Institution and Lecture Notes.—Physical Society of London.—At the meeting held on October 26th a paper on "The Radius of the Electron and the Nuclear Structure of Atoms" was read by Prof. J. W. Nicholson. The electron is usually regarded as a globule of electricity with a definite radius. This conception has proved valuable, but involves difficulties in connection with the nuclear structure of complex atoms. On the view that the electron consists of a region of strain in the aether, such line constants should have some significance throughout the whole aether; which may, in fact, be in some manner cellular with these linear magnitudes involved in the specification of the cells, and therefore in any strained structure composed of them. The electron would be regarded as a state of strain which for practical purposes is concentrated at its centre, rapidly diminishing outwards according to some very convergent law involving some line constant in its specification. By way of illustration the idea is worked out mathematically on the assumption that the strain varies as $e^{-\lambda r}$, on which hypothesis λ^{-1} is the "radius." It can be shown that the Lorentz formula for mass as a function of velocity can be obtained for this type of electron. The charge on the electron is regarded as a fundamental property of the aether, and is related to Planck's constant h .

Dr. H. S. Allen said there could be little doubt of the existence of a relation referred to by Prof. Nicholson between Planck's constant h and the charge of an electron e . Taking Millikan's latest value for e (4.774×10^{-10}), $h = 6.558 \times 10^{-27}$. All the principal radiation constants could be expressed in terms of e . On the lines suggested in Prof. Nicholson's paper it would seem as if most, if not all, of the important constants of nature might be referred to some fundamental property of the aether.

Sir Oliver Lodge wrote that he was much interested in Prof. Nicholson's ingenious plan for doing away with the definite boundary of an electron, and devising a mathematical scheme which should enable them to regard it as a point-centre of strain decreasing exponentially in every direction without limit, so that the linear dimension associated with it should be like many time-constants—the distance at which the density was reduced to $1/e$ th of what it was at the centre. This plan, if it could be developed properly, seemed to get over many of the difficulties about the coherence of parts of a charge, and about the extraordinary properties of a nucleus, which though, from some points of view, an extremely small and highly-charged unit, yet necessarily had a complexity which enabled it to be disintegrated and fired off in fragments. Prof. Nicholson's suggestions seemed to him helpful and valuable.

Association of Mining Electrical Engineers.—On October 13th, the president of the West of Scotland Branch, Mr. H. A. McGuffie, delivered his address, and on November 10th the works of the North British Welding Co. at Finnieston were visited, a demonstration of electric welding being given. The other arrangements for the session are as follows:—

- December 15th.—Visit to the works of Mavor & Coulson. Social evening.
- January 12th, 1918.—"Cable Complaints," by J. H. C. Brooking.
- February 16th.—"Steam Turbines as Applied to Colliery Work," by P. J. Pliven.
- March 9th.—"Conservation of Exhaust Steam and its Utilisation," by J. Watson.
- April 6th.—Inspection of mechanical and electrical models at the Art Galleries, Kelvingrove.
- May 6th.—"Organisation of Electrical Repairs," by J. McCann.

Members of the North of England Branch, on November 3rd, visited Washington Colliery, County Durham, and inspected the electrical equipment at the "F" and Glebe Pits. There is an extensive electrical installation at these pits, which was commenced in 1907 by the fixing of a Sirocco fan. Current from the County of Durham Electrical Power Distribution Co. is received at the pit yard at 6,000 volts, and reduced to 600 volts by two 500-K.V.A. transformers. The fan above mentioned is belt-driven by a motor of 150 H.P., and, running at 164 R.P.M., supplies 120,000 cb. ft. of air at $2\frac{1}{2}$ in. W.G. This displaced a 36-ft. Guibal fan, steam driven, and the successful result of the conversion led to the elimination of a good deal of steam plant at the "F" Pit. Underground at the "F" Pit there are four main and tail haulage sets converted from steam drive; the change-over from steam to electricity caused so little trouble that not one ton less coal was drawn during the whole operation. Other plant is:—Air compressor, 900 cb. ft. capacity, motor 150 H.P.; air compressor, 300 cb. ft., 60 H.P.; main and tail haulage set, 25 H.P.; endless rope set, 27 H.P.; endless rope set, 10 H.P.; "creeper," 5 H.P.; pump, 110 H.P. At the Glebe Pit there is on the surface an air compressor of 2,000 cb. ft. capacity, driven by a 350-H.P. motor. Underground there are two main and tail haulage sets, driven respectively by 75 and 80-H.P. motors, an air compressor, and a three-throw pump, 110 H.P.

Institution of Mechanical Engineers.—At the meeting, last Friday, Mr. A. W. PURCHAS read a paper on "Air-lift Pumping," in the course of which he endeavoured to supply a satisfactory theory of the working of this type of pump, to show how the efficiency could be improved, and to point out the data that should be recorded in testing such pumps in order to provide the information necessary to the correct interpretation of the results.

The paper included details of the equipment and methods employed in making a number of tests, and laid stress on the liability to serious errors incurred if the volume of air was calculated from piston displacement—errors of 10 to 60 per cent. The greatest loss, he said, was in the air-compressor; the next greatest was the loss of head at entry to the suction pipe. A pump efficiency of 70 per cent. should be attainable on all lifts up to 300 ft.

Institution of Electrical Engineers.—The opening meeting of the MANCHESTER LOCAL SECTION was held on the 13th inst., when the chairman (Mr. C. J. Beaver) delivered his inaugural address. He dealt with the effects of the war on the world's in-

dustry in general and on industrial progress in this country in particular and, after reviewing the trend of opinion amongst various classes, he detailed a series of reforms which appeared to be necessary, and indicated the important part that should be played by the Institution in connection with their realisation.

On November 11th, Mr. S. T. Allen, chairman of the BIRMINGHAM LOCAL SECTION, delivered his inaugural address, dealing mainly with the future course of the manufacturing industry in this country and the part that might be played by the Institution in connection therewith. In particular, he referred to the remarkable developments in electrometallurgy and in the use of the electric furnace which had taken place in the Midlands, and emphasised the necessity for a cheap supply of electrical energy to enable the new industries to compete with foreign countries after the war. The waste at present incurred through the transport of fuel and the removal of incombustible materials, and other sources of loss, were mentioned, and the chairman concluded by pointing out the necessity of utilising the inventive capacity of everyone interested in the electrical industry.

Royal Institution of Great Britain.—Prof. J. A. Fleming, D.Sc., F.R.S., will deliver a Christmas course of six illustrated lectures (adapted to a juvenile auditory) on "Our Useful Servants: Magnetism and Electricity":—

- Thursday, December 27th, at 3 o'clock.—"Magnets and the Magnetic Compass."
- Saturday, December 29th.—"Electricity and Electric Currents."
- Tuesday, January 1st, 1918.—"The Electric Current as a Heater and Chemist."
- Thursday, January 3rd.—"Electricity as an Illuminator and Doctor."
- Saturday, January 5th.—"Electric Dynamos, Motors, Transformers, and Railways."
- Tuesday, January 8th.—"Telegraphs and Telephones."

Royal Society of Arts.—Delivering the opening address on Wednesday, Mr. A. A. Campbell Swinton (Chairman of the Council) dealt with "Science and its Functions." He pointed out the danger that the working out of industrial processes and inventions, involving the risk of vast sums of money, might be checked through the fashion of regarding the making of large profits as a crime. He also urged the necessity of having science as a compulsory part of the curriculum of training for the Civil Service, so as to get the Departments filled by men who realised how science lay at the root of all material progress.—*Morning Post*.

Liverpool Engineering Society.—The opening meeting of the session was held on November 7th, when Mr. H. Dickinson delivered his presidential address. On Wednesday last, Mr. J. B. C. Kershaw read a paper on "The Conservation of Our Fuel Reserves by the Use of Low-Grade Fuels for Power Generation." On December 5th Mr. E. Jones will read one on "High Efficiency Air Pumps for High Vacua."

Birmingham Electric Club.—Mr. Howard Foulds, secretary of the City Electric Supply Department, read a paper, on Saturday last, before the Birmingham Electric Club, on the subject of "Publicity." Notwithstanding the pressure of Government work, he insisted that it was necessary to be prepared for the time when conditions became normal. Then a publicity campaign might be undertaken individually or collectively. Sound publicity could be obtained by careful and wise expenditure in the ordinary course of business. Persistency was one of the fundamentals of success.

Chadwick Public Lectures (Leicester).—On November 17th the first of a series of three Chadwick Lectures on "Electricity and National Welfare" was given at the Museum, Leicester, by Prof. H. T. Davidge, of the Ordnance College, Woolwich. The lecture dealt with "Electricity and the Improvement of Town Atmospheres." Mr. Davidge stated that the special aim of the lectures was to urge the pressing necessity for applying the latest developments of electrical science as an aid to:—

- (a) Making the best of our homes.
- (b) Making the best use of our soil.
- (c) Making the best of our bodies.

Recognising that a large part of mankind tends to congregate into towns, the drawbacks of town atmosphere were pointed out, and the use of electricity was described, when used as a palliative, in removing smoke and fumes after formation. The wider problem of smoke and fume prevention was then discussed, and after sketching the delights of a district completely supplied electrically with heat, light and power, the lecturer showed that the need was urgent for a system of power stations on a large scale, using very efficient, and, therefore, large generators, the cheapest fuel, the highest possible load factor, high voltage to obtain efficient distribution, and interlinking between the stations to economise in spare machinery. Broad-minded and highly instructed legislation was indicated as a necessity.

The second lecture of this series, on "Electricity and Increased Food Production," will be given to-morrow at 7.30 p.m.

Australian Copper.—Reuter's Melbourne correspondent says that the Australian Copper Producers' Association has been formed entirely to control the shipping and selling of copper on a co-operative basis. Before the war copper was sold almost entirely through the German metal ring.

National Reconstruction.—The Education Committee of the British Science Guild, on the 5th inst., passed a resolution to the effect that national reconstruction, in order to be efficient, urgently demanded as a primary condition that the Education Bill introduced on August 10th should be proceeded with in the House without delay, and should be passed into law during the present session. The Executive Committee of the Guild, last week, approved the resolution, copies of which were sent to the Prime Minister and to Mr. Fisher.

Electric Vehicle Notes. The Detroit Taxicab and Transfer Co. (U.S.A.), which operate nearly a hundred electric taxis, has decided to obtain women to operate them between the hours of 7 a.m. and 6 p.m.; over 500 women have applied for positions. Chicago and St. Louis also have growing fleets of electric taxicabs.

The Wellington (New Zealand) Harbour Board has carried out a series of tests with a 1,000-lb. battery truck of the warehouse type. This is equipped with Edison batteries capable of running the truck for a full working day, and is the first "electric" of this type seen in New Zealand. *Board of Trade Journal.*

The City Electric Light Co., Ltd., Brisbane, Australia, has put into service a 5-ton electric self-tipping lorry for the purpose of carting coal from the Roma Street Railway coal shutes to the

ELECTRIC COAL TRUCK AT BRISBANE, AUSTRALIA.

power station in William Street, a distance of, approximately, 1½ miles. The following particulars were supplied by Mr. John D. Just, the manager of the company:

The lorry, which weighs approximately 10 tons when loaded, is operated from a 44-cell Chloride ironclad Exide battery, and has a range, when loaded, of 45 miles on one charge, with a speed of 7 miles per hour. The body of the lorry can be elevated to an angle of 45°, and is, therefore, self-emptying, whilst it is filled by gravity at the coal shutes. The elevating of the lorry body is done by a 3-h.p. electric motor driving through gearing two vertical screws; this operation takes less than one minute.

The chassis was supplied by the G.V. Co. (U.S.A.) through its Australian agents, but the body and elevating gear were designed

ELECTRIC TRUCK TIPPING COAL AT POWER STATION.

and built in Brisbane. The lorry and its driver are now handling 50 tons of coal daily, and have replaced eight tip drays; the average consumption of electricity by this lorry, taken over one month, was 243 units per route-mile. The electrically-operated lorry has a great future before it, and the large capacity motor lorry can more than hold its own against the antiquated horse drays.

In this connection, it is interesting to notice that, in his recent annual report Mr. A. C. Cramb, the Croydon borough electrical engineer, mentions that a 1-ton electric lorry has been in commission from the beginning of the year, and during the first six months handled 3,110 tons of coal at a cost for wages and electricity of £107, or taking a vehicle life of eight years, and setting aside £78 for depreciation and £46 for repair fund a total cost of £231, which shows a saving of £46 on contract haulage for the six months. The battery is guaranteed for eight years, and although £46 has been credited to repairs the actual cost has been nominal. During the last three months a bonus system was in use, and 2,215 tons were carted a 12½ per cent. weekly increase. The cost was £132 against £203 by horse haulage, showing a saving at the rate of £250 per annum.

Volunteer Notes.—COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).—Headquarters, Balderton Street, Oxford Street, W. 1.

Orders for the week, by Lieut.-Colonel C.B. Clay, V.D., commanding:—

Officer for the Week.—Lieut. W. J. A. Watkins.

Next for Duty.—Second Lieut. H. G. Golding.

Drills.—Week ending Saturday, December 1st, 1917:—

Monday.—No. 3 Company, Left Half. Recruits, signalling, 6.30.

Tuesday.—Physical drill and bayonet exercise, 7.30.

Wednesday.—No. 1 Company, 6.30.

Thursday.—No. 2 Company, 6; signalling, ambulance, 6.30.

Friday.—No. 3 Company, Right Half. Recruits, 6.30.

Saturday.—Commandant's Parade, 2.45, at Headquarters. Uniform. For route march and drill. Compulsory for A, B, and C men, unless special leave is obtained.

Musketry.—Belvedere Road, Tuesday, Wednesday, and Thursday, 5.30 to 7. Note.—The Medical Officer will attend for examination of recruits, &c., on Thursday, at 6.

Unless otherwise indicated, all drills will take place at Headquarters.

(By order) MACLEOD YEARSLEY, Capt. and Adjutant.

Electrical Ship Propulsion.—The new U.S. battleship *New Mexico*, now being built at the New York Navy Yard, the first warship in the world to be electrically driven, is approaching completion. An official statement was prepared not long ago in Washington, which gave some of the advantages of the electric drive on the larger ships, and was published in the *Electrical World*; this was the statement:—

"Electrical propulsion virtually gives duplicate means of propulsion. With two turbines and two motors, one or either of them could break down and still leave a means of propulsion; this is, of course, true in the case of direct-connected machinery, but in the case of the electric drive, if it is a turbine that is broken down, the propulsion would still be twin-screw. The two turbines would be so designed that either would be capable of giving about 17 or 18 knots, and the normal method of running would be with one turbine and two motors. This makes it possible to overhaul the other turbine, whether it is at sea or not. The turbines are always operated under fairly good load conditions, and, hence, always give good economy. Since only one turbine is used at the lower speeds, the load on it will always be twice as much as for direct-connected machinery. The turbines are always operated under fairly good speed conditions, and this ensures good economy of the turbines. This is due to the fact that the speed reduction ratio is variable. This is accomplished by winding the stators of the motors for two different numbers of poles, either of which can be put into operation by simply throwing a switch. For example, if the generator has two poles, and the motors are arranged to have either 30 poles or 50 poles, the reduction in the first case would be 15 to 1, and in the second case 35 to 1. This combination of good load conditions and high speed is really the vital point, so far as economy at cruising speeds on a battleship is concerned; and it is an advantage that any other form of propulsion will find it difficult to overcome. The governor absolutely eliminates all racing in a seaway, with the attendant strains on shafting and danger of throwing propeller blades. Speed can be maintained with much greater accuracy than with any other form of propulsion. This is of little importance to a merchantman; but it is not necessary to emphasise the importance of this in a battleship to anyone who has been in the Fleet. The space taken up is less than required for other forms of propulsion. The arrangement of the machinery is much more flexible than any other form of propulsion, as the position of turbines and motors is not fixed. The readiness with which repairs can be effected is an argument. Owing to the small size of the turbines, the upkeep will be very materially reduced. The rapidity of operation is much greater than with other forms of propulsion.

Electric propulsion does not require a separate turbine for backing. Electric propulsion has been adopted for seven battleships and five battle cruisers now being built for the U.S. Navy.

Thermo-Electric Effect by Throttling.—In a communication made to the Paris Academy of Sciences Mr. Karl Benediks mentions the following fact contrary to Magnus's law. In a homogeneous metallic circuit, a dissymmetric distribution of temperature gives rise to a thermo-E.M.F. He has sketched out a device which permits of increasing these forces somewhat in order to render them measurable with high-resistance low-sensitivity galvanometers. It was found, for example, that a cross of tungsten wires 0.22 mm. in diameter, heated with a micro-flame 5 mm. in height to a temperature estimated at 900° C., gave an E.M.F. of 19 millivolts, or about double that given by a platinum-rhodium thermo-couple (10 per cent.) for a temperature of 1,000° C. at the hot junction. Similarly by the contact of angular fragments of a ferro-silicon (50 per cent. silicon), considerable deviations took place—an important point for the theory of contact rectifiers used in wireless telegraphy.

In a later communication Mr. Benediks further dealt with this new thermo-electric effect, which may be considered as a reversal of the Thomson effect. He showed its extension to the liquid metals, like mercury, in which its sign conforms to that which is shown by theory. The direction of deviation changes with the sign of the magnetic field, in accordance with theory.

Appointments Vacant.—Sub-station attendant (49s.), for the Borough of West Hartlepool Electricity Department; mains assistant, for the Dover Corporation Electricity Works; senior and junior shift engineers, for Rotherham Corporation Electricity Department; shift engineers (50s. +), for the Borough of Oldham Electricity Department; switchboard attendant (35s. +) for the Bolton Corporation Electricity Department; switchboard attendant for the Gravesend Corporation Electricity Works; mains superintendent (63s. +) for the Bedford Corporation Electricity Department; switchboard attendant (48s.) for the Battersea B.C. Electricity Works. See advertisement pages to-day.

Lamp with Renewable Filament.—An incandescent lamp which can be readily re-charged with gas and fitted with a new filament is disclosed in U.S. Patent No. 1,232,741, issued to A. J. West, of Winnipeg, Manitoba. In this lamp, which is of the gas-filled type, there is no need for a vacuum, as it is only necessary to retain the gas in the globe under its own pressure. Accordingly, the lamp is so made that the globe can be removed to permit the renewal of the filament, and when the globe is attached to the head the joint is tight enough to retain the gas admitted. Further, in the head is provided an easy means for re-filling the lamp with gas, and retaining the gas. Upon the filament being rendered useless, the globe can readily be unscrewed from the head, and the filament withdrawn through the neck of the globe. After a new filament has been substituted, the globe can be replaced. At this time, however, it is necessary to re-charge the globe with gas. This is done by removing a screw plug and re-charging the globe with gas through a provided opening. Upon the globe being filled with the gas, it is screwed tightly in and the plug is inserted.—*Electrical World.*

Educational.—**MIDDLESEX.**—The Education Committee has approved a scheme for the extension of day continuation classes in Edmonton and Tottenham for boys engaged in large engineering works. The classes will be held at Edmonton Technical Institute and the Tottenham Polytechnic. The manufacturers concerned are willing to liberate the boys for six hours a week during working hours, but suggested one evening session, to make a total of eight hours a week, for the session ending in May.

SPAIN.—An Institute of Electrical Industries has been established in Barcelona to impart instruction in the various branches of the electrical industry. The promoters have in view the great development which the electrical industries must take on in the near future.

The Nobel Prizes.—It has been decided by the Swedish Academy of Science not to award the Nobel Prize for physics and chemistry for the years 1916 and 1917. The prize for 1917 will be reserved until next year.—*The Times.*

Fatality.—Last week an employé of the Grove Dyeing Co., at Littleborough, died from the effect of an electric shock, apparently obtained on touching a machine; two other employés who went to his assistance also received shocks.

The Zurich Bank and the Depreciation of Foreign Investments.—As was recently mentioned in this journal, the prominent investment and underwriting company known as the Zurich Bank for Electrical Undertakings has only been able to declare a dividend at the rate of 5 per cent. for the year ended with June 30th, 1917, as compared with 8 per cent. each in 1915-16 and 1914-15, on ordinary share capital of £3,000,000, whereas in each of the two preceding years the rate was 10 per cent. on the same amount of capital, apart from meeting the interest on the loans which, in each of the years cited, were higher than the ordinary capital. Many of the bank's interests are situated in Italy, Germany, France, and other countries, and the depreciation of the currency in these countries under the influence of the war has, naturally, been felt by the bank. On this point the directors state that, owing to the unexpectedly large fall in the currency of all belligerent countries in relation to that of Switzerland, a considerable depreciation has taken place in the bank's credit and investments in foreign currency. The bank has, therefore, taken this into account by entering at the rates of exchange which prevailed on June 30th, 1917, all its current banking credit abroad of which the bank will be able to dispose at some future period. In the case, however, of the considerable amount of long-term advances made to the foreign undertakings closely associated with the bank, as well as the latter's investments in these undertakings, the directors announce that they have concluded agreements with friendly banking syndicates according to which, on a possible realisation of these holdings later on, a fixed rate of exchange has been guaranteed to the bank, which forms the basis upon which these assets have been entered in the books. These rates of exchange, it is stated, are certainly higher than those which prevailed in October of the present year, but they are still considerably below the normal rates founded upon the gold parity. Naturally, the guarantee operation has imposed a certain sacrifice on the bank through the general provision of the necessary equalising fund which is associated with it, but the directors state, on the other hand, that it has permitted the bank so to deal with its foreign assets that the proceeds could be fully placed in the year's accounts.

The Use of Formed Solder.—In manufacturing articles having many soldered joints difficult to reach, it is good practice to furnish the solder punched or formed to fit the seam, as the time, labour and solder saved are important considerations; moreover, the formed solder is more likely to reach every part of the seam and ensure a tight joint. An important manufacturer of automobiles makes use of a solder link stamped from a thin sheet of solder, in making radiators of the tubular type. The radiator element is built up of vertical rows of tubes pressed through thin copper plates.

The ends of the tubes must be soldered tightly into the water chambers. The solder links are dropped over the ends of the rows of tubes and are melted with a blow-torch. The solder, being applied all around the tube in link form, runs down the tube to the tube sheet and makes a practically perfect soldered joint on five tubes simultaneously. It is obvious that much time is saved by the use of formed solder links in confined places like this; in fact, it would be practically impossible for the workman to apply solder to all the tubes in a reasonable length of time unless it were furnished him in the stamped shape.—*Machinery.*

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials. On November 10th the staffs of the Lincoln electricity and tramways department presented a watch to the chief clerk, Mr. STANLEY SAUNDERS, who, after 20 years' service, is resigning to take up the position of senior clerk in the Salford Corporation electricity department. Mr. Stanley Clegg, the city electrical engineer, made the presentation.

Burton T.C. has accepted the resignation of Mr. JAMES J. CAMERON, chief assistant engineer at the electricity works.

Wimbledon T.C. has increased the salary of the borough electrical engineer from £500 to £600 a year.

Mr. PHILLIPS, electrical engineer to the Bedford T.C., has joined the R.F.C., at the request of the Military authorities.

Mr. J. B. HAMILTON, general manager of the Leeds Corporation tramways, who has for some months been Director of Trades Regulation under the Admiralty, has been invited by the Board of Trade to join the new Control Committee in connection with the tramway services of the country. The invitation to Mr. Hamilton was discussed at a meeting of the Leeds Tramways Committee on Monday, and it was decided to give him a free hand in regard to its acceptance. His new position will entail the resignation of the Admiralty appointment. Mr. Hamilton is at present Chairman of the Executive of the Municipal Tramways Association, three of whose members have been invited to membership of the new Control Committee.

Mr. H. F. C. MITCHELL, who has been for 18 years mains inspector to the Derby Corporation, has been presented with a case of pipes and pouch on his leaving to take up the position of superintendent of mains and sub-stations for the British Cellulose Chemical Manufacturing Co., Ltd., Spondon, near Derby.

General.—Mr. G. C. HAMILTON, M.P. for Altrincham, who will be remembered by electrical men as being formerly connected with Messrs. Drake & Gorham, Ltd., informs his constituents that he is unable to deal with any division matters, as he is taking up the organisation of the work of the R.F.C. in France, and will be away for some time.

Mr. W. GIBSON has relinquished the post of manager of the Grand Theatre, Falkirk, to take up an appointment in the electrical department of Falkirk Iron Co.

Ald. A. R. JERHCOTT has been re-elected, for the fourth time, chairman of the Birmingham Corporation Electric Supply Committee.

Ald. ENOCH PRIESTLEY and Coun. I. F. ACKROYD have been re-appointed chairman and vice-chairman of the Bradford Tramways Committee. Ald. G. H. ROBINSON has been appointed chairman of the Electricity Committee for the fifteenth time.

Ald. MARSLAND and Coun. SHIRES have been appointed chairman and deputy chairman of the Huddersfield Electricity Committee. The Tramways Committee has appointed Councilors SELLERS and CANBY.

Prof. C. G. BARKLA, of Edinburgh, has been awarded the Hughes Medal of the Royal Society for his researches in connection with X-ray radiations.

On Wednesday, November 14th, at Ecclesall, Lieutenant WALTER J. CRIDGE, 15th Sherwood Foresters, who is now attached to the Central Clearing House, Ministry of Munitions, was married to Honor Isabel (Belle), second daughter of Dr. W. Collier, of Ecclesall, Sheffield.

Coun. A. A. THOMSON and Ald. G. J. ALLEN have been elected chairman and vice-chairman of the Croydon Corporation Tramways Committee respectively for the ensuing year.

Mr. WALTER ALLNUTT, F.S.A.A., who has for many years held the post of secretary of Callender's Cable & Construction Co., Ltd., and the Anchor Cable Co., Ltd., has, in consequence of his advanced age and the necessity for obtaining greater leisure, requested the directors of those companies to release him from his engagement with them. The directors have acceded to his request, and have appointed Mr. HOWARD FIELDS, who is at present secretary of the Electric Supply Committee of the Birmingham City Council, to fill the vacancy thus occasioned. Mr. Foulds will commence his duties as secretary of the above companies on January 1st next.

Roll of Honour.—Sec.-Lieut. L. P. SIDNEY, K.R.R.C., attached R.F.C., reported killed, aged 24, according to the *Times* studied in the National Physical Laboratory Testing Laboratories under Dr. Stanton, and in the Metallurgical Laboratories under Dr. Rosenhain. Subsequently he spent a year in iron and steel analysis with Mr. F. W. Harbord.

Private D. MORRIS, Manchester Regiment, killed in action, was employed by the Lancashire Dynamo & Motor Co., Ltd., Trafford Park.

Private W. YOUNG, Manchester Regiment, who has died of wounds, was an apprentice with Messrs. Lightfoot Bros., electrical engineers, Manchester.

Lance-Corporal H. COOPER, formerly a motorman on the Ashton-under-Lyne Corporation tramways, has been awarded

the Croix de Guerre, and also a bar to it, together with the Medal Militaire, for conspicuous bravery at the front.

Private G. R. PEMBERTON, Royal Warwickshire Regiment, of Aston, and A.B.S. GREGORY, Royal Naval Detachment, Handsworth, former employes of the Electric & Ordnance Accessories Co., Birmingham, have fallen in action.

Lieutenant R. O. GLADSTONE, R.E., formerly on the outside-construction staff at the B.T.H., Rugby, has been killed in action.

Private A. JONES, of the K.O. Royal Lancaster Regiment, killed in action, was formerly employed by Messrs. Lightfoot Bros., electrical engineers, Manchester.

Gunner F. BOOTH, R.F.A., killed in action, aged 25, was a former employe of the Chloride Electrical Storage Co., Ltd., Clifton Junction.

Privates J. WALKER, wounded, J. BARKER, wounded, H. WEST, wounded, and J. E. ALLEN, missing, were all former employes of the St. Helens Cable & Rubber Co., Warrington.

Private J. KENWORTHY, Loyal North Lancashire Regiment, news of whose death in Mesopotamia has been received, was in the employ of Mr. E. Dewhurst, electrical engineer, Preston.

Bombardier G. PRESTON, R.F.A., who was employed as an electrician by Mr. G. Newby, Harrogate, has died of wounds.

Private T. WALTON, N.F., who has been killed in action, was apprenticed as an electrical engineer with Mr. Pearson Rukin, Bradford.

A.B. W. A. TAYLOR, Nelson Division, who is suffering from gas poisoning, was employed by Mr. Fisher, electrician, Doncaster.

Corporal C. E. HART, West Yorkshire Regiment, who has been missing since October 9th, was employed in the Leeds Corporation electricity department.

Lance-Corporal J. D. R. HEXES, of the King's (Liverpool) Regiment, killed in action, aged 22, was apprenticed with Mr. Fred Garnett, electrical engineer, Blackpool.

Lance-Corporal G. W. S. WHITEFIELD, Manchester Regiment, killed in action, was in the employ of the Manchester Corporation electricity department.

Private J. SHAW, King's (Liverpool) Regiment, aged 23, killed in action, was employed by Messrs. Dick, Kerr & Co., Ltd., Preston.

The Military Medal for good work as a linesman under exceptionally hard conditions from time to time has been awarded to Sapper C. J. EDDY, R.E., who enlisted from the staff of the Kent Power Co., at Chatham.

Private F. H. MARTYR, Queen's Royal West Surrey Regiment, killed in action, was on the staff of the British Westinghouse Co., Ltd.

Sapper S. A. TYLER, R.E., who has died in hospital at Chatham, was on the staff of Messrs. Belliss & Morcom, Ltd., Birmingham.

Sapper H. CHIVERS, R.E., who has died from wounds at Ronen, was a wireman with Mr. T. C. Bush, electrical engineer, of Bath.

Sergeant J. ELLIS, R.A.M.C., killed in action, was for some years with the Potteries Electric Traction Co., Ltd., of Stoke-on-Trent. He had by gallantry gained the D.C.M. and a bar.

Corporal J. L. CARSTAIRS, who has gained the Military Medal for bravery, was engaged in the East Greenwich generating station of the L.C.C.

NEW COMPANIES REGISTERED.

Staveley Electric Supply Co., Ltd. (148,900).—Private company. Registered November 16th. Capital, £5,000 in £1 shares. To carry on at Staveley and elsewhere in Derbyshire the business of an electric lighting and supply company, to provide electrical energy for any private or public purpose as defined by the Electric Lighting Act, 1882, &c. The subscribers (each with one share) are:—C. P. Markham, Ringwood, Chesterfield, nominator; J. Court, Staveley, Chesterfield, surgeon; C. W. Kendall, Staveley, Chesterfield, mineral water manufacturer. The first directors are:—C. P. Markham, J. Court, and C. W. Kendall. Solicitors: Stanton & Walker, Chesterfield.

W. & D. Conveyor Engineering Co., Ltd. (148,893).—Private company. Registered November 14th. Capital, £10,000 in £1 shares. Manufacturers of and dealers in labour-saving machinery in connection with the transport of goods, runways of all kinds, elevating machinery, humpers, stackers, and conveyors; electrical and general engineers, &c. The subscribers (each with one share) are:—H. O. King, Redlands, Badyr, near Carlisle, shipowner; M. Fletcher, 31, Great St. Helens, E.C., Lloyds' broker; W. H. Weguelin, Balholm, Chorley Wood, Herts., engineer; W. E. P. Doudney, 33, Plainfield Crescent, East Dulwich, S.E., engineer. The first directors are:—H. O. King, T. Fletcher, W. H. Weguelin, W. E. P. Doudney, and C. H. Bennett. Solicitors: Downings, Crosby Buildings, E.C.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

General Cable Manufacturing Co., Ltd.—Debenture for £1,500, dated November 6th, 1917, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: T. Cohen and Co., Ltd., Spencer House, E.C.

CITY NOTES.

Monte Video Telephone Co., Ltd.

Mr. CHAS. LOCK presided at the annual meeting on November 19th. He said that the year's results were quite satisfactory, considering the difficult times. The subscriptions, rentals, &c., amounted to £78,402, against £72,000. The larger gross receipts were the result of an increase of 614 subscribers. Taxation showed a very substantial increase. There had been an increase in the actual amount of working expenses, but the actual percentage per subscriber showed a slight diminution, which was to the credit of the Monte Video management. With regard to the application for a concession for underground plant, last year he pointed out that, in view of the heavy cost of materials, the directors hoped that any grant of a concession would be delayed for some little time, and that the periods provided for in the concession for obtaining approval of the plans and raising the capital should be extended. Since then prices of materials had still further increased to an enormous extent, while it would be practically impossible for some time to come to place orders. Under these circumstances the only practical course was to suspend all idea for the present of undertaking an underground system. The cost at the present time, even if the materials were procurable—which was quite impossible—would be nearly three times as much as before the war, so that the net revenue of the company under present conditions would in no way suffice to provide an adequate return on the capital involved. It would also be quite impossible to obtain the sanction of the British Treasury for new capital for such an enterprise, so that their only reasonable course was to suspend this matter until times became more favourable. With regard to supplies, the Board had felt the necessity of looking ahead in these times, and they had managed, to place orders which would give them supplies of the principal parts of their materials for at least 12 months to come.

Swiss Companies.

The report of the *Watt A.G. für Elektrische Unternehmungen, of Glarus*, which is associated with the Zurich Bank for Electrical Undertakings, states that the company's activity in 1916-17 was limited to hitherto existing investments. These experienced a decline in the results, whilst at the same time large losses on the rate of exchange were incurred in the interest receipts in foreign currency. The accounts indicate net profits of £1,400, as compared with £9,800 in 1915-16, when a dividend of 3 per cent. was paid on the ordinary share capital of £300,000, but no distribution is possible for 1916-17.

The directors of the *Maschinen-Fabrik Oerlikon, of Oerlikon*, reporting on the year ended on June 30th, 1917, state that the scarcity of fuel resulted in the receipt by the department for machinery and transformers of considerable orders from industrial establishments, and the demand and turnover in special drives for the textile industry were very active. The great activity in the department for lighting apparatus and electro-mechanical applications continued, and sales were on the level of those in the preceding year, whilst the turbine branch was also well occupied. In the electric railway department the company had set in operation the equipment for the Biel-Tauffelen railway, and the delivery of the equipment for the London & North-Western Railway Co. was being carried out gradually. During the whole of the year the foundry for grey castings was fully occupied, and an increase took place in the orders received for forgings. The manufacture of fuses and shell cases was undertaken for the Swiss military authorities, but the company continued to refuse to supply war material to all belligerent countries. The accounts, after allocating £44,000 to depreciation, as contrasted with £43,000 in 1915-16, show net profits and balance forward of £43,000, as against £39,000 in the previous year. It is proposed to pay a dividend of 7 per cent. on the ordinary share capital of £320,000, being the same rate as in 1915-16. The directors now recommend an increase in the share capital to £640,000 by the issue of new shares, which will be offered to existing proprietors, the object being to provide additional capital for the further extension of the works in expectation of the development of business after the war.

German Companies.

The report of the *Elektro Werke A.G., of Berlin*, the financial ownership of which has now passed into the possession of the Government, states that the power station was fully completed in 1916-17, and the deliveries to the State nitrate works at Piesteritz amounted to 307,380,000 kw.-hours, and to 53,382,700 kw.-hours in the case of the Electro Nitrate works. At the end of the financial year the fuel requirements were being entirely satisfied by the output of the company's lignite mines, the average daily production being about 8,000 tons. The accounts show a loss of £1,700 for the year.

The *A.E.G. Unternehmungen A.G., of Frankfurt-on-Main*, which originated from the A.E.G.-Lahmeyer Works, reports having disposed of shares in the Bergen (Norway) tramway at a large profit on the rate of exchange in 1916-17, and of £50,000 in shares in the Meissen tramway. On the other hand, a block of shares in the Linz-Urfahr (Austria) tramway was purchased. The accounts exhibit net profits of £31,000, as against £33,000 in 1915-16, the rate of dividend

being 6 per cent. on share capital of £500,000, as in the previous year.

The Suddutsche Telephon Apparatus, Kabel und Drahtwerke A.G., of Nuremberg, whose share capital of £50,000 is mostly held by the Felten & Guilleaume Co., report that a loan of £338,000 was raised in 1916-17 to defray the cost of extensions of the works and provide capital for the increased turnover. After making provision for depreciation to the extent of £19,000, as against £11,000 in 1915-16, the accounts indicate net profits of £27,000, as compared with £11,000. It is proposed to pay a dividend and bonus of 45 per cent., this contrasting with 20 per cent. and 10 per cent. in the two preceding years respectively.

The Rhein-Westfälisches Elektrizitäts Werk A.G., of Essen, whose undertaking is one of the largest in the country, reports an increase in the connections and turnover in 1916-17 as a consequence of the great expansion in the war industries. Although the total number of glow-lump connections was not very materially augmented, the number of motors rose from 38,000 in 1915-16 to 40,500 last year. The total value of the connections, including those of the company's associated undertakings, advanced from 400,000 kw. to 432,000 kw., and the deliveries expanded from 388,118,000 kw.-hours to 555,063,000 kw.-hours in the two years respectively. As a result of the growth in the working expenses various supply companies had raised their charges by up to 30 per cent., and the company would have to follow this example. The gross profits are returned at £606,000, as compared with £531,000 in 1915-16, and after apportioning £204,000 to depreciation, as against £186,000, the accounts exhibit net profits of £213,000, as contrasted with £222,000. It is intended to pay a dividend of 8 per cent. on the ordinary share capital of £2,500,000, being the same rate as in each of the five preceding years. The loan capital amounts to £1,760,000.

Cape Electric Tramways, Ltd.—For the year ended June 30th, 1917, the profit and loss account shows a profit of £79,893, and after providing for debenture interest and redemption, and including the balance brought forward, the net credit balance is £39,152, out of which £12,000 has been credited to reserve fund, and 5 per cent. is to be paid on the ordinary shares, leaving £2,591 to be carried forward. The passengers carried numbered 23,752,016, producing £231,106, against 22,477,366, producing £212,792 in the previous year. A satisfactory increase is shown both as regards the Cape Town and Port Elizabeth systems, attributable to the passing through of Australian and New Zealand troops and to the general prosperity throughout South Africa. The difficulties of obtaining supplies, and the high prices of all materials, as well as increased war bonuses to employees, keep the cost of operation at a high level. The expenditure is further increased by the additional taxation recently imposed by the Union Government, from which provision has had to be made. In spite of these difficulties the profit showed an increase of £6,225.

United Electric Tramways Co. of Caracas, Ltd.—As the local company has again declared a dividend absorbing its net profits for the year, the directors continue their policy, during the period of the war, of fully distributing amongst the shareholders the whole of the available net revenue. Out of the disposable balance of £13,799 a dividend is recommended at the same rate as last year (7 per cent., less income-tax), carrying forward £1,899.

Amazon Telegraph Co., Ltd.—The gross revenue for the year ended June 30th, 1917, was £72,114, and the working expenses were £31,539. After providing for income-tax and depreciation of investments, also £12,812 for debenture interest and £10,113 for sinking fund, £8,000 is placed to general reserve, 4 per cent. dividend, less tax, is paid, and £7,187 is to be carried forward.

Coalite, Ltd.—The "Morning Post" states that negotiations have for some time past been in progress for the exploitation of the company's patents. An agreement has now been concluded with Low Temperature Carbonisation, Ltd., under which that company is appointed manager of the business of Coalite, Ltd., for a term of 10 years from October 1st, 1917.

Callender's Share & Investment Trust, Ltd.—Dividend of $2\frac{1}{2}$ per cent., less income-tax, for the half-year, making 5 per cent. for the year. After putting £500 to reserve, and £741 to writing off preliminary and debenture stock expenses, £5,279 is to be carried forward.

Calcutta Electric Supply Corporation, Ltd.—The number of units sold to consumers during the four weeks ended September 28th, 1917, has amounted to 2,354,138, compared with 2,156,682 units in the corresponding four weeks of 1916.

Stock Exchange Notice.—The undermentioned securities have been ordered to be quoted in the Official List:—

Melbourne Electric Supply Co., Ltd.—Further issue of £150,000 5 per cent. consolidated debenture stock

France.—The Société des Ateliers Mécaniques et Electriques de Gennevilliers has just increased its capital to 3,500,000 francs.

Chloride Electrical Storage Co., Ltd.—Interim dividend on the ordinary shares, 5 per cent., free of tax.

British Ever-Ready Co., Ltd.—Dividend, 10 per cent. per annum on the ordinary shares for the half-year ended September.

Electric Construction Co., Ltd.—Dividend at the rate of 6 per cent. per annum on the ordinary shares, less income-tax, in respect of the year ending at March next.

Castner-Kellner Alkali Co., Ltd.—Dividend, 11 per cent. for the half-year ended September, making 20 per cent. for the year.

STOCKS AND SHARES.

TUESDAY EVENING.

The Stock Exchange continues to move along cautious lines. Petrograd and Moscow are not providing light literature at present. The Italian rally, at the time of writing, is welcome, but interest awaits keenly the next developments. At home, the campaign which has begun in earnest in connection with the War Bonds is straitening purely investment business, though the War Loan and Consols keep good. Amongst the electricity markets, the feature is a continuance of activity, accompanied by rising prices, in shares of the manufacturing companies.

No further rumours have come to the ears of this individual column of the ELECTRICAL REVIEW, but hopes are more than keeping pace with the advance in prices that there is something in the air with reference to a combination of interests. Apart from this, however, it is declared by people who profess to know, that the electrical manufacturing companies are enjoying a good share of the prosperity attendant upon many other industries, upon which point the expert reader is likely to have better information than a mere financial echo. At all events, General Electric ordinary are 10s. better at 19— a splitting scheme would be highly acceptable to those who like to see a free market in any shares—while Electric Constructions are better at 23s. 9d. India-Rubbers rose 5s. to 11 $\frac{1}{2}$. Edison Swan 7 per cent. first preference have been wanted at 21s. 3d., and the partly-paid at 16s. Cromptons moved back a little to 12s. 9d., and the preference are steady at 15s. 6d.

Lighting shares keep firm. There is still a demand for those of the principal London companies, but would-be buyers get tired of waiting after a time, and seek other investments if they cannot get those which they want at first. Charing Cross Ordinary have put on 5s., Kensingtons are $\frac{1}{2}$ up, and so are City of London preference.

In the telegraph market, Globe Ordinary are $\frac{1}{2}$ better at 13 $\frac{1}{2}$, but the Preference have lost a similar fraction at 10 $\frac{1}{2}$. Great Northern recovered to 39. Western Telegraphs went back a little to 15. The Eastern group is steady. "China" shares changed hands the other day at 14 $\frac{1}{2}$, and Eastern Telegraph Ordinary at 149; Eastern 3 $\frac{1}{2}$ per cent. Preference at 61 and the 4 per cent. Mortgage Debenture stock at 73 have both been dealt in at these prices. The former stock at the present price returns 5 $\frac{1}{2}$ per cent. on the money. A good deal of business is being done in Oriental Telephones between 59s. 6d. and 62s. 6d., the middle price being advanced to £3 16s. United River Plate Telephones have been in some little request at 6 11/16. West India & Panama Preference are £8 for the Firsts and £7 for the Seconds, while the ordinary, ex the sixpenny dividend, are left at 1 7/16. Direct United States shares have lately changed hands at 6 $\frac{1}{2}$. Anglo-American Telegraph Preferred has attracted investment buying on the basis of 97. Marconi shares weakened to 3 3/16, the Preference also easing off to 2 9/16, with Americans lower at a guinea and Canadians at 10s. The recent severe slump in American rails in New York has, no doubt, something to do with the drop from 23s. in American Marconis, and this is affecting the parent shares. Another Stock Exchange case of the tail wagging the dog.

The railway market is uninteresting. No changes occurred in the electric stocks, though Districts are actually lower than they look from the nominal price of 16. British Electric Traction are steady. London United Tramways Debenture stock gained attention at the end of last week, a fair number of bargains being done at about 35. London & Suburban Ordinary were bought at 2s. 9d. on Monday; the last recorded bargain in the 5 per cent. Preference was about a week ago at 7s. 4 $\frac{1}{2}$ d. The company's "A" Debenture stock is a little better at 80 $\frac{1}{2}$.

Foreign issues are mainly dull, more particularly Mexicans. Mexican Light & Power Common remains at 22 $\frac{1}{2}$, but the Preferred shed 4 points to 31, and the First Mortgage Bonds fell 2 to 40 $\frac{1}{2}$. Brazil Traction and British Columbia Electric are fairly steady, and a conspicuous feature of strength is the 5 per cent. Debenture stock of the Anglo-Argentine Tramways, which has risen 3 to 71, in spite of circumstantial reports as to the outbreak of fresh labour trouble due to begin on one of the railways this week.

Castner-Kellner shares are $\frac{1}{2}$ up at 3 9/16, and other chemical shares are also strong. Babcock & Wilcox gained 5s. at 3 5/16, in a boomlet which has broken out amongst iron and steel shares generally, in which those of engineering companies have joined. Several companies have just lately pro-

posed the organisation of their capital accounts in such a manner as to afford shareholders a substantial bonus, and the boomlet referred to is based on the expectation that other concerns will follow suit by way of admitting their proprietors to a larger slice of profits than the former could receive in the shape of dividends, having regard to the excess profits duty. The rubber market is sticky, with the price of rubber showing a dullish tendency at half-a-crown per lb. Armaments hardened in sympathy with the iron and steel group.

German Central-Station Tariffs.—A recent communication from the Elektrizitätswirtschaftsstelle (Electricity Administration) to the E.T.Z., discusses the grounds upon which central stations are entitled to increase their charges for electrical energy. The price of coal has risen by 100 per cent. or more, that of other working materials has risen by several hundreds per cent., and wages have risen to an extraordinary level since the beginning of the war. Voluntary allowances to dependents of workmen called to the colours represent a further heavy burden on practically every electricity undertaking. Bulk consumers are therefore urged to pay a higher price for energy, in proportion to the increased cost of production, even where long-term contracts give them a legal right to a supply at pre-war prices. Another respect in which central stations are hard hit is in loss of revenue owing to:—(1) The introduction of "summer-time." (2) Restricted use of light and power on grounds of economy or due to small works being closed. (3) Absence on active service of innumerable small consumers. It is pointed out that the effective maintenance (financial and material) of electricity and gas works is a matter of national importance, also that these concerns are at present subject to abnormal depreciation as well as increased working costs. For some time after the war, renewals will be very costly, and allowing for all these factors, a 25 per cent. increase in the selling price of energy is none too much.

Cracking Hydrocarbon Vapours by Electricity.—A process that aims to obtain by means of an electric discharge a greater yield of fixed gases from hydrocarbon vapours, is the development of J. G. Davidson and R. W. Ford, of Vancouver, B.C., Canada. Patent No. 1,229,012 has been granted covering the discovery that by passing such vapours through an electric brush discharge field, the amount of non-condensable gases is increased. In actual tests it is claimed that by this process the amount of C_2H_4 in the gas has been increased from about 25 per cent. to approximately 40 per cent., while the amounts of C_2H_2 were increased from between 7 per cent. and 10 per cent. to between 20 per cent. and 23 per cent. Ordinarily the gas is conducted through a plurality of conduits formed as vertical pipes connected at their lower ends to a supply header and at their upper ends to an outlet header, the discharge electrodes being formed of wires hung axially in the pipes from an insulated support. The pipes are grounded and the electrodes are connected by a wire to a mechanical rectifier of the usual rotary type included in the high-tension circuit of a step-up transformer, the other pole of the rectifier being connected to ground. —*Electrical World.*

THE INSTITUTION OF ELECTRICAL ENGINEERS.

Abstract of the Inaugural Address delivered by
MR. C. H. WORDINGHAM, President, November 8th, 1917.

(Continued from page 480.)

RESEARCH.

With a strong Institution such as I have depicted, the field of usefulness would be enormous, and the potentialities almost beyond calculation. One of the most important matters demanding attention is research. Scientific research on purely academic lines should be closely pursued, for it is from such work, having apparently no commercial application, that the industry itself and many of its most lucrative developments have sprung. Equally important is industrial research, by which I understand the development of scientific discoveries and new methods of manufacture.

The point I wish to make is that the workers at both kinds of research should be welded together so as to assist one another, and so that the manufacturers may have a call on the highest talent in the country, while the scientific seeker after discoveries may avail himself of the resources of the manufacturers to test any promising inventions he may make. Such co-operation must tend to give far better results than any independent efforts of one class of worker without the other.

In the National Physical Laboratory we have magnificent facilities for scientific investigation of the highest class, and now that it has been taken over by the Advisory Council for Scientific and Industrial Research it may be hoped that it will in future be supplied with adequate funds by the Government.

Industrial research stands on a very different footing in every way. If industrial research is to be of real value to the nation it is essential that much of the work done shall be kept secret, and only imparted to those who will directly utilise the information obtained for the benefit of British trade. Fortunately, this has been recognised from the first by the Advisory Council of Research, and much valuable work has been, and is being, done to enable British manufacturers to produce articles formerly obtained from abroad, such articles in many cases being of superior quality to the foreign ones.

If new discoveries or processes are obtained by the employment of public funds, it may be argued that they should be the property of the nation; on the other hand, the funds would have been of no avail without the genius of the discoverer, and he is obviously entitled to a substantial share of whatever profit is made.

Industrial differs from purely scientific research also in the scale and, in consequence, the cost of experiment. The concentration of the manufacturing interests in the hands of one or two gigantic companies in America and Germany has enabled those companies to develop their facilities for research to an extent that is clearly impossible in this country, where a much smaller volume of manufacture is conducted by a multiplicity of firms. In consequence, what facilities exist for industrial research are partial, unco-ordinated, duplicated, and incomplete. There is, therefore, a crying need for the establishment of one or more fully equipped laboratories on a large scale for the investigation of industrial problems. Such laboratories will need the generous support of the Government and the manufacturers.

Much research and many discoveries have taken place here in spite of the unfavourable conditions. The cleverness of the Germans, of which we have heard *ad nauseam*, has lain not in their originality or inventiveness, but in their quickness in appropriating other people's inventions; they have provided the money to tempt away to Germany the English inventor whose work was received with coldness and suspicion by those of his fellow countrymen possessing the capital necessary to secure the fruits of his labour, and who would not provide the funds. Hundreds of cases could be cited in illustration. I may mention one that came under my notice quite recently. A material widely used in electrical apparatus could before the war only be obtained from Germany. A firm of manufacturers in this country discovered that the whole of the plant and process for producing this material was the invention of an Englishman; they were fortunate enough to get into touch with him, with the result that they are now putting down plant which is a duplicate of that which he had designed for his German employers, and the material will now be made in this country of exactly the same quality as, or probably better than, that formerly only obtainable from Germany. We have the discoverers and inventors in this country, and always have had them; if we given them facilities as good as those possessed by our rivals, and back them up with financial support, the possibilities before us are unlimited—but we must do both.

A consideration of laboratories leads me to another matter to which I have already very briefly alluded, namely, the establishment of an institution which shall be in a position to say authoritatively whether certain standards have been complied with, and to give a hall-mark to British manufactures. It has long been a cherished ambition of mine to see established such an institution, for which I have suggested the name of National Electrical Proving House. In 1899 I read a paper before the Institution in the course of which I

described a local attempt which I had made, with a considerable measure of success, to test samples of fuses, switches, and similar fittings with a view to certifying that they reached a certain standard of excellence, and I strongly advocated that the Institution should take the matter up and carry out the idea on national instead of local lines. My proposals, however, met with considerable opposition, and nothing was done. Previous to 1913 a serious situation had arisen in connection with British trade in Canada on account of the non-existence of such an authority as I have indicated, British manufacturers having to send their goods to Chicago to be tested and passed before they could be sold in British Canada! In view of this, the Council referred the matter to a special committee, but owing to the outbreak of war the question had to stand over. After waiting for about a year and a half I sent to the technical Press, with the sanction of the then President, the proposals which I had wished to make to the Committee. I had outlined a definite scheme, and my proposals met with considerable support, and were favourably received by the I.M.E.A. and the B.E.A.M.A., but nothing happened. Since the war, the reality of the need which I first pointed out 18 years ago has been appreciated, and there is clear indication that the proposal commends itself to manufacturers and, with a courtesy and consideration which I highly appreciate, members of the B.E.A.M.A. have asked me to bring the matter forward at the Institution during my year of office. A Committee of the Council has already been instructed to report on the matter, and has recommended the setting up of a committee representing the interests concerned. When this committee has drafted outline proposals an opportunity will be given for the matter to be fully discussed by the general body of members, after which I hope that definite and adequate steps may be taken before the close of the session to set up an authority which shall be able to certify whether an article is or is not in conformity with a given standard of excellence, and shall give it a hall-mark which shall be recognised throughout the world as a guarantee of British origin and British excellence and reliability.

INFLUENCE OF THE WAR.

The political measures for the furtherance of trade can find no place in an address such as this. I will only remark that while the potentialities for good immanent in the Government are enormous, they should be directed towards assisting industries, and not be employed in interfering with them. Each industry knows best its own business and requirements, and how its interests can be furthered.

Nationalisation of certain industries is not infrequently mooted, but I venture to think that in no case should the Government undertake any business of a commercial nature. It starts with the handicap of being regarded by most as the legitimate prey of all who can get the better of it, and it is further handicapped by the impossibility of employing those methods which make for success in obtaining business and executing it satisfactorily. I refer more especially to individual effort and initiative, untrammelled power for those engaged in the work to decide and act quickly, freedom and secrecy in negotiations, and finally the important and perfectly proper incentive of personal profit.

The chief ways in which Government can assist industry are the safeguarding of British interests abroad, so that the British trader may be at least on an equal footing with those of other nationalities in foreign markets; the shielding of young industries in this country from foreign competition during the period of their infancy, and from unfair and State-aided competition when adolescent; the conservation of natural products of the Empire for the exclusive use of British manufacturers up to the maximum quantities required by them, due regard being paid also to a reasonable extent to deferring ultimate exhaustion; the removal of all obstructive and injurious legislation; and, finally, the collection of really useful information as to foreign markets not available to traders by their own unaided efforts, and its dissemination without delay among those concerned. I have already indicated the good that I think might be done by the Government in connection with engineering by conferring wider powers on the existing engineering institutions.

The problem of the promotion of British trade after the war is one which has come in for an immense amount of consideration and a much greater amount of talk. There is a strong tendency to co-operation and federation, with a unification of organisation that must bring about a powerful body representing British trade.

In deliberating upon the action to be taken, every effort must be made to give due weight to each consideration, and to avoid turning a principle eminently true and valuable into a shibboleth and pushing it to such an extent that, in place of being beneficial, it becomes mischievous. I believe the keynote of our success in the future to be co-operation and federation. The same principle is capable of application on a still grander scale, and having already federation among our own Dominions, may we not hope that our alliance with the other great branch of the Anglo-Saxon race may not be for the time of the war only, but that some way may be found, if not of actual federation, at all events of working together in harmony for the good of our branch of the human race, and opposing those nations who have shown their whole nature, ideals, and methods to be antagonistic to our own.

and of combating dangers of which the embryo is only faintly discerned at present, but which in the fullness of time may threaten our very existence.

While it is imperative that combination should be effected among manufacturers for the promotion of the Empire's world trade, in combining let us not forget it is the individualism of the Briton which has brought him into the position that he occupies in the world. Combination should be effected on lines which will recognise the British characteristic of individuality. The autocratic and machine-like methods of training suitable for the German cannot be successfully applied to the British manufacturer, who does best when he retains his own initiative and individuality. There is every indication that combination will be effected on lines which will not crush out the small manufacturer, and which will enable combinations of firms to be made in such a manner that the orders are obtained by a common organisation while the work is carried out in individual factories, each factory taking that portion for which it is best suited.

There is one danger to our trade which I greatly fear, and which will be realised unless we as individuals can rise above our own selfish immediate apparent interests, and can consider the good of the nation as a whole. The outbreak of war probably took all of us by surprise, but not the subsequent demonstration of the depths of degradation of the German mind and soul. To many of us the whole tendency of modern German thought and aspiration, and the German methods of commerce were wholly and utterly repulsive, and many of us were fully alive to the danger to which this country was exposed by the insane encouragement given to the import of German manufactures and the fatuous belief in German superiority. The eyes of many have been opened, but whether the awakening is permanent time alone can show. Never was the warning "Lest we forget" more necessary than now. Let us remember that the leopard does not change his spots, and, once the sheep's clothing has been stripped off, let us never again be deceived by the artificial exterior, however woolly and lamblike it may appear; the spots are still there. Let us not be deceived. The German has been our deadly enemy for many years past, he has been our open enemy during the last three years, and nothing has occurred which can render it in the least degree probable that he will become anything less of an enemy in the future. Let every man who is tempted, as he will be tempted, and tempted very strongly, in the near future to fall back into his old reliance on German produce, remember that in yielding on account of what appears to him to be his immediate commercial advantage he is showing himself to be a traitor to his country, and is ultimately assisting in his own downfall. If this nation is to survive in the industrial war on which we must shortly enter, it can only do so by recognising its enemies, and by its individuals holding together and supporting each other's efforts for the common welfare. Let the first question asked when dealing with a firm be, "Is it British?" and if it be not, then let one be sought that is. It may be contended that in many branches of the industry the British-produced article is inferior to, as well as dearer than, the German. If we assume this to be true, the obvious line of action is to take steps to improve the manufacture of that article, and to give those who make it a market to supply; the British manufacturer will very soon rise to the occasion, and rapidly pass his German competitor if only he be given the chance.

The war has powerfully affected Capital and Labour individually and their mutual relations. The expenditure on war-like material, coupled with a great reduction in the ratio of exports to imports, has impoverished the nation, and driven large amounts of capital into other hands than ours. The result will be that many of the profitable enterprises presenting themselves after the war will have to be financed in large measure by foreign capital. This is a danger that must be watched closely, for it will greatly mar the value of the expansion of our trade if the profits go out of the country, and it will obviously retard progress seriously if they are not available for the nourishment of our own business.

There is, however, an encouraging feature in connection with the effect of the war on capital, namely, the bringing home to most what was already known to many, that our industry was strangled for want of financial support, more especially in connection with new inventions which, while involving risk, contain also vast possibilities. We may hope that broader and wiser views will prevail in future, and that British capital will to a much larger extent be applied to the development of British trade, instead of being sent abroad to provide the sinews of war for the foreigner to attack our trade.

It is in Labour probably that the most tremendous problem of the immediate future resides. The power and influence in the hands of the workman have been demonstrated in an unmistakable manner. The stress of war, and the necessity for increased production have cast a lurid light on the methods adopted by the workmen in their supposed interests in times before the war. Neither masters nor men are likely to put up with their relations with one another being interfered with by outside authorities even so exalted as the Government, when once the war is over, and the fate of industry will depend upon how the acutely difficult problems are freed and dealt with by the two parties concerned.

The extraordinary development of women's labour raises

issues that are intricate and new. Having tasted independence and high wages, a number of those now working will desire to continue their present activities, and probably this will be bitterly opposed by the men, but I do not believe that there will be any great access of women permanently to the ranks of engineering workers. Women are physically unfit to endure the heavy work inseparable from most engineering operations; they may support it for a time, but, if persevered in, the results can hardly fail to be disastrous.

The upheaval that has taken place has probably so affected men's minds that they will be able to approach the matter with far more hope of success than if their ideas had remained stereotyped. Unquestionably mistakes have been made, and the rank and file have often been misguided, but there have been many reprehensible actions on the part of the employers, and the men's attitude has not always been without strong provocation. No one can listen to the speeches of some of the Labour leaders and be acquainted with their personalities without recognising the marked ability and honesty of purpose of many of them. Certainly, all those who have had direct dealings with workmen themselves must acknowledge that as individuals many command respect for their general character as men and their ability as workmen. That there is serious unrest at present is certain, and much of it has been traced to causes that give reasonable grounds for its existence.

It is quite certain that the men will have to be given a much greater share in the management and profits of the undertakings they are engaged on. It is equally certain that they are not at present fit to occupy the position that the importance of their contribution to the country's wealth justifies. They must be taught that they have duties as well as rights; they must be educated to take an intelligent interest in their work and in its development; their prejudices, ignorance, and suspicion must be broken down, and many serious misconceptions cleared away. Masters must learn that they themselves must do what they enjoin on their men; they must remove their own ignorance of the conditions of life and of the viewpoint of their men, and they must get rid of the suspicion that they entertain of the men, which is just as great, and perhaps as ill-founded, as the men's suspicion of them. While asking the men to deal fairly with them they must see to it that they set the example of fairness.

Unless masters and men can succeed in understanding and trusting one another, and in working together for the common good, this nation must go under in the industrial strife before us.

I believe success is to be attained by giving each man in some way or another a direct interest in the financial results of the concern employing him; by letting him have some say in its management; by treating him as a man, and not as a machine; by letting individuality have play; by ensuring that every man, even though not brilliant, shall if he works steadily be decently housed, clothed, and fed; by shielding men from coercion by their fellows, tending to reduce their efficiency; and by promoting in every way mutual regard and trust between employers and employed.

(To be concluded.)

Newcastle-upon-Tyne Local Section.

The first meeting of the current session of the NEWCASTLE LOCAL SECTION was held on November 12th, at the Mining Institute, Newcastle. Mr. H. W. Clothier, the retiring chairman, made reference to the death of Mr. Duddell, whom he characterised, as one of the most brilliant men in the electrical industry, who took so great a part in the electrical problems connected with the war that he absolutely wore himself out. He also made an urgent appeal on behalf of the Volunteers for the signalling corps of which men were wanted, and announced that one of their members, Acting-Major Geo. Stamp Taylor, R.E., had been decorated with the Military Cross. He was formerly connected with the electrical service of the North-Eastern Railway Co.

Mr. A. H. MARSHALL (Middlesbrough), the new chairman, said that recently nothing had stood out so prominently as the necessity of a better utilisation of our coal supplies and the giving of a cheap supply of power to the industries of the country, and he purposed to discuss the use of electricity and its bearing on fuel-saving in the iron and steel trades; it seemed to him that it was with those trades that the electrical industry would be associated for its greatest development in the immediate future. There was every indication that the next few years would see a greater combination of interests, better application of capital, and the utilisation of every means to economy. This must result in the extended employment of electricity. With efficient plant and means for the recovery of surplus heat, it was commercially possible to supply all the heat and power requirements of a works that was laid out complete with coke-ovens, blast furnaces, steel furnaces, and mills, from the combustion of the coal fed into the coke-ovens. This was an ideal arrangement which had been aimed at, but not attained, because even the largest undertakings had not been able either to dispense with their coal-fired heating plant or to justify the capital expenditure necessary to make full use of their waste energy. But such an economical arrangement could be obtained if one applied the advantages of linking-up to the electrical end. The idea that there were enormous quantities of gas and waste heat which could be converted into electrical energy and used for outside purposes, was a misunderstanding. It was only by taking full advantage of every means available for heat

recovery that there was any margin of power to spare in a properly co-ordinated undertaking. He submitted the following figures showing how the energy of the coal as fed to the coke ovens was distributed in the process of coking, smelting, and steel making. The energy values were expressed in Kelvins (K.W.-hours), and he was dealing with the conditions of iron and steel manufacture on the North-East Coast, taking as a basis 1 ton of ordinary Durham coking coal, having a value of 12,500 B.T.H.U.

TABLE I.

DISTRIBUTION OF ENERGY IN 1 TON COAL, 12,500 B.T.H.U. CONTAINING 8,200 KELVINS.

Quantity of product.	Carbonising 1 ton of coal.	Kelvins applicable for conversion to power.
5,500 cb. ft.	Gas used on ovens ...	690
5,000 cb. ft.	Gas surplus ...	630
7 ton	Coke ...	6,000
65 ton	Coke breeze ...	300
100 lb.	Tar ...	470
2½ gallons	Benzol ...	110
		8,200
	Smelting 64 ton pig-iron.	
31,700 cb. ft.	Gas used on stoves ...	930
73,800 cb. ft.	Gas surplus ...	2,160
1 ton	Slag (sensible heat)...	650
64 ton	Pig-iron (sensible heat)	250
	Furnace react'ns & loss	2,010
		6,000

UTILISATION OF SURPLUS GAS FROM COKE OVENS AND BLAST FURNACES.

Making steel (68 ton)	1,200	300
Reheating ingots (do.)	390	—
Balance ...	1,200	1,200
	2,790	2,500

CONVERSION TO ELECTRICAL OR MECHANICAL POWER.

Total available energy ...	2,500
Less slag value ...	650
	1,850
Thermal efficiency ...	15 %
1,850 × 15 = 280 K.W.-hours per ton of coal.	

In order to fix the idea, he took the case of a group of works equipped with four 70-oven batteries, consuming 8,700 tons per week, five blast furnaces each making 1,100 tons of pig per week, and sufficient open-hearth steel furnace capacity and rolling mill plant to convert the whole of the pig-iron make into finished steel sections; 8,700 tons of coal per week was, at a steady rate of consumption, approximately 50 tons per hour.

TABLE II.

KW. OUTPUT.

Coal consumed per hour...	50 tons.
Electrical energy per ton of coal	280 Kelvins.
Nominal output, 280 × 50	= 14,000 KW.
Minimum output, 14,000 × 76	= 8,400 KW.
Average output, 14,000 × 785	= 11,900 KW.

KW. LOAD.

Units required per ton of coal.	Mean kw.	Load factor.	Max. kw.
Coke oven auxiliaries }			
Blast furnace do. }	40 × 50	2,000 at	76
Steel furnace do. }			3,300
Blowing plant (120 × 64)	77 × 50	3,800 at	79
Rolling mills (110 × 68)	75 × 50	3,700 at	76
		9,500	14,000

Average output units per week, 11,900 × 168	= 2,000,000
Consumption do. 9,500 × 168	= 1,600,000

Surplus ...	400,000
-------------	---------

This table shows the power consumed at the works.

The coke-oven results were those obtained with any well-known make of by-product regenerative oven, operated under ordinary commercial conditions. Mr. Marshall referred to the present state of things to show what scope there was for an improvement from the point of view of fuel economy. In old-established Cleveland practice the surplus heat from the blast furnaces was converted into power by means of shell-type boilers in open settings and non-condensing steam engines at a thermal efficiency of about 5 per cent., and as a consequence there was generally little gas to spare. The exhaust steam turbine, in a good many cases, had improved the thermal economy by another 5 per cent. It was here that the power companies had been able to effect a very considerable saving of coal, while the advantages to the ironmasters had been great, not alone from the payment they received for what otherwise would be a waste product, but by getting the steam returned to them in the form of water. The advantages claimed for the electrical reversing mill had been well substantiated in practice, as was borne out by the fact that there were at present under construction at least seven reversing mill equipments, ranging from 10,000 to 20,000 H.P. in size, capable of doing the heaviest class of work, both roughing and finishing, with outputs of over 50 tons per hour. These new mills would altogether have a capacity of well over 1,000,000 tons of steel per annum. In addition, there

were numerous A.C. motor continuous mill drives being installed, in sizes of from 2,000 to 10,000 H.P. An application of electricity which had not received the attention it deserved was that of locomotive haulage for shunting purposes in such cases as they were considering, where probably there would be 12 locomotives in commission consuming 1,800 tons of coal per annum. On a very close estimate of work done, the thermal efficiency came out well below 1 per cent. The total consumption by steel works in the country for this purpose alone, on the same basis, was 160,000 tons per annum; taking for electrical driving a thermal efficiency to the motors of 10 per cent., there would be a saving of over 140,000 tons per annum. The most recent electrical development in steelworks practice, and one which had received a great impetus from the war, was the electric furnace, which was working very successfully.

What he had tried to show was that there was, on a commercial basis, sufficient energy in the coal required for the blast-furnace coke to perform all the various operations, thermal and mechanical, in and about an iron and steel works, but that owing to the large and sudden fuel variations, there must be a standing plant capacity at hand for immediate use, and also a means for consuming what surplus energy there was available. Only in this way was it possible to obtain the full and safe use of all the heat energy of the coal at low capital cost. Until such time as there was sufficient co-ordination of coke ovens, blast furnaces, and steel works to avoid the destructive burning of coal, it was evident that a linked-up electrical system was still more necessary for picking up the waste heat wherever it might be found, and passing it on to where it might be used. That was what, to a great extent, had already been done by the power companies. As an illustration of the scope of future electrical development, the total electrical energy to be dealt with, on the figures he had put before them, assuming them to apply to a make of steel of 14,000,000 tons, which, according to Dr. Addison, was what next year's output would amount to, and not counting the power taken by the blowing plant, worked out at 3,300,000,000 units per annum, with a maximum load of over 600,000 kw. In conclusion, he said it was somewhat surprising, considering the dependence of any fuel economy scheme upon electrical means for its realisation, how little that Institution had been identified with the enormous possibilities of electrical expansion, which had stood ready to hand at any time for the past 20 years. It was to be hoped that in future a great technical institution like theirs would have more influence on capital enterprise, and would carry more weight with the men responsible for the government of the country.

THE STATE OF TRADE.

By "COMMERCIAL."

THE prospect of the war continuing for an indefinite period to come has naturally prompted the commercial leaders of the staple pre-war industries of the country to seriously review the present situation of trade and its future outlook. In the opinion of a great many of those who are in the best position to judge, the situation, to say the least of it, is far from reassuring.

During the past 12 months the conditions under which trade has laboured have been beset with so many unforeseen difficulties, and the essential basic principles upon which a business is governed have become so perverted, that to obtain a correct view of the state of trade throughout the country has proved almost a hopeless task. Yet we are strongly of the opinion of these commercial leaders themselves, that to carry on indefinitely under a false sense of prosperity created by new and passing conditions, while the old and proven sources of industry are allowed to pass out of control, as a result of outside interference, incompetence, and neglect, is to subscribe to a system that is as ruinous in effect as it is short-sighted in policy.

After making the fullest allowances for the abnormal conditions brought about by the exigencies of war, the conviction continually thrusts itself forward that too often the interests of trade are being sacrificed to the dictates and mandates of an inexperienced body of newly-arisen officials, whose encroachments upon the recognised privileges of trade have been allowed, under the plea of war necessity, to be carried to a length that is wholly unwarrantable.

Perhaps one of the best examples of the disorganised state of affairs at present ruling throughout the country may be found in the essential war industries themselves, which have a controlling interest in almost every other subsidiary trade of any importance. It is not unreasonable to expect that, after the valuable experience acquired in the three years that have elapsed, and the absorption and control of the best brains and equipment the country possesses, the war industries themselves would, at least, be conducted on sound business-like lines; yet, to judge from the complaints that are continually being made from various sources, this is, perhaps, far from being the case.

The source of the disorganisation proceeds very largely from the Government offices themselves. Whereas, until 12 months ago, they could be relied upon to pay their accounts in reasonable time and in good order, the complaint is being heard all round of the confusion and delay of the Government offices in not only failing to remit accounts long after they are due, thereby involving considerable financial inconvenience among traders, but in even failing to keep in proper order elementary records of consignments of

goods of which, long after they have been consumed, they have to admit "no trace."

As regards the railways, which are under Government control, the conditions are no better. It is almost a regular daily occurrence for one Government Department to insist upon every other interest being put aside until an urgent demand is executed, only to afterwards learn that the goods have been held up in the warehouse or at the station for intervals of a week or a fortnight while the railway companies among themselves decide when to carry them.

That the railways, which are one of the vital arteries of trade, and especially of war organisation, are hopelessly understaffed, and that the purely military demands upon them have been far too liberally responded to, there can now be very little doubt whatever. The Government was long ago warned of this impending danger by responsible business men, but once again the military influence overruled the commercial. It is, perhaps, a somewhat significant fact that whenever complaints are made as to the shortcomings of British trade organisations, as compared with those of other countries, either in peace or war times, the British railways are almost invariably found to rank among the chief offenders.

The continued increase in the wages bill presents, perhaps, one of the most perplexing problems a business management has ever had to contend with. Whatever doubts the employer may entertain as to the Government's wisdom in keeping down discontent in other directions by imposing these additional burdens upon trade, he has practically no voice whatever in the matter while the Government has the power to dictate what he must do.

We have no desire to criticise the Government upon what it considers the best policy under the existing difficult and unprecedented conditions, but we should feel more reassured, as regards the future, if the Government openly declared its intention, as we have before suggested in these columns, it ought, in common fairness, to offer to do, not to abandon the employers after the war to settle as best they can this chaotic problem of wages readjustment, in connection with which so much bitter controversy and discontent are likely to be associated.

Electric Lighting and the Value of House Property.—

In the Bow County Court, last week, Judge Graham, K.C., decided that to have a house fitted out with electricity enhanced its value. Messrs. E. J. Rose & Co., Ltd., sued Wm. Geo. Shinn, of Chiswick, to recover £23. Defendant decided to move out of London in a hurry, and saw Messrs. Trimming, the agents for the plaintiffs, about a house at Teddington, and it was alleged that he agreed to take it on a three years' lease. Fitting it out with electricity was spoken about, and the plaintiffs agreed to pay half. Top speed was the only question, and the work was proceeded with at once, the completion being promised in eight days. The house had to be papered as well, and he chose the paper. The electric lighting actually cost £26 10s., of which they were asking £13 5s. When they sent the agreement to him to sign, however, he refused, saying his wife was too ill to be moved. They had done the work, and wanted the payment. Mr. Singleton, of Messrs. J. Singleton and Sons, electric light fitters, Hampton Hill, said they fitted the electric light. He did not think it enhanced the value of a house much, as some people wanted gas, and were quite content with it for light as well as for cooking. The plaintiffs said that electric light would not benefit at all, as people did not specify for it. He did not consider electric light was a factor in the matter at all. The defendant said they promised to send the agreement along for signature in two days, but it did not arrive for four, by which time he thought it was off, and had taken another house. Counsel for the defence said it was a preposterous claim that this house should be fitted with electric light and he should not be allowed a penny for it. Anybody knew that fitting a house with electric light increased its value. Judge Graham decided that the value was increased, and gave a verdict for the plaintiff for £21 only, and costs.

We have recently been overwhelmed with a torrent of addresses of Chairmen of Local Sections of the Institution of Electrical Engineers, all, as well as the address of the President, delivered within a period of eight days, and have found it a difficult matter to digest so generous a feast of reason, contrasting so sharply with the straitened regimen imposed upon our alimentary organs. The Presidential Address alone would have sufficed to provide a fruitful source of topics for discussion; we have already touched upon some few of its prominent features, and must content ourselves with a brief reference to others.

In common with several of the Chairmen, Mr. Wordingham laid stress upon the immense importance of research in connection with our industries not only in the development of new methods and discoveries, but also in the field of pure science, in which the seed is sown that forms the indispensable origin of such—and added his quota to the universal appeal for co-operation between all classes of workers. He also drew attention to the discouragement usually met with by inventors in this country, and this is a point which for generations has acted as a brake on the wheels of progress; apparently we are, as a nation, inherently sceptical as to the value of new ideas, of which, nevertheless, we have always been prolific. It would be easy to cite scores of instances in which British inventions, turned down with contempt at home, have been eagerly taken up and developed by foreigners, to their great profit; the striking example adduced by the President will, however, suffice, and it is only to be regretted that we are not always so fortunate as in this instance. In the aggregate an immense amount of invention and discovery of British origin must thus have been driven abroad, with the result that, besides losing the opportunity to establish new industries, we have later had to pay heavily for the products of the foreign manufacturers. Not only should our industrial leaders do more individually to encourage and develop the spirit of invention by more liberally—or, rather, more equitably—rewarding inventors, basing their assessment on the true value of the new ideas instead of the usual plan of paying as little as they can in decency offer, but also our patent laws should be radically revised in favour of the inventor. The principle at the basis of "letters patent" is to obtain full publication (as the name implies) of new discoveries, for the benefit of the nation, whilst rewarding the inventor by securing to him a monopoly of the profits for a term of years; it is needless to point out how far our patent laws fall short of attaining either of these ends, and the utter misconception of the situation which is cherished by the authorities is blatantly exemplified by the fact that the Patent Office is conducted on the lines of a revenue-earning department! Who would dream of running the National

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE:—4, LUDGATE HILL, LONDON, E.C. 4.

Telegraphic Address: "AGEEKAT, LONDON." Code, A B C.

Telephone Nos.: City 997; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, £1 1s. 8d.; Canada, £1 3s. 10d. (\$5.80). To all other countries, £1 10s.

FOREIGN AGENTS:

ADELAIDE: Messrs. Atkinson & Co., Gresham Street.

AUCKLAND N.Z.: Gordon & Gotch, Albert Street; The Mining and Engineering Review, 31a, Strand Arcade, Queen Street.

BRISBANE: Gordon & Gotch, Queen St.

CHRISTCHURCH, N.Z.: Gordon and Gotch, Manchester Street.

ELECTRICAL & ALLIED TRADES DIRECTORY

(THE RED BOOK),

1917 EDITION.

H. ALABASTER, GATEHOUSE & KEMPE,
4, Ludgate Hill, London, E.C. 4.

Physical Laboratory as a trading concern, in order to assist the national revenue? Yet to do so would be exactly analogous to the practice pursued in the case of the Patent Office, which should spend every penny of its revenue on the improvement of the facilities offered to inventors, and might justly claim a national subvention in addition. We are glad to observe that there is a strong movement in progress with a view to bringing about drastic reforms in this backward department.

The National Electric Proving House, advocated by the President, is an institution for which we also have repeatedly pressed: such a scheme was actually in course of germination just before the outbreak of war. The benefits that it would confer upon the electrical industry would be almost incalculable, and we most sincerely hope that Mr. Wordingham's powerful advocacy, backed as he is by the B.E.A.M.A., will bring it into existence at the earliest possible date, as a matter of urgency.

For the President's views on the future policy of the Government for the furthering of British trade we have nothing but praise: the same applies to his weighty warning with regard to the denial of trading relations with the German after the war. Let the German salesman learn that his wares, like his deeds, stink in our nostrils, and that no Briton who values his self-respect can enter into any sort of intercourse with members of a nation that bedded our wounded men, prisoners in their hands, on horse-dung, and kicked and spat upon them as they lay in silent agony.

On behalf of science we must enter a gentle protest against the conclusions at which the President has, to our mind, too hastily arrived. He refers to the effect upon the German nation of "the cultivation of science to the exclusion of other human activities," and infers that science is to be held accountable for the barbarities of which they have been guilty. Surely this is a mistaken view. In the first place, the Germans, above all other nations, have made a speciality of those studies collectively known as the humanities, to such an extent, indeed, that our classical teachers are constantly referring their students to German authorities upon the classics and upon other branches of literary erudition, including—oh, shameful confession!—the study of the English language and history. In recent years, comparatively speaking, they have studied science also, but their vile prostitution of the teachings of science to the ends of military aggression no more reflects upon the virtues of a scientific training than upon the value of classical studies. It is their inherently brutal temperament, their intense egoism and vainglory, that is at the root of their misdeeds. Those of us who are crying out for reform in our educational methods demand not, as Mr. Wordingham suggests, the elevation of science to the position of "the be-all and end-all of education and existence" by no means: what we call for is a scientific education, a very different thing, in place of the lop-sided and myopic system that at present dominates our public schools and older universities, and we most heartily endorse the President's support of "those moral and religious principles which alone can afford adequate or worthy motives for human action." As he says himself, engineering as a profession, "rightly apprehended, is one of the most ennobling," bringing a man "into intimate contact with the laws and processes of Nature, and their everlasting truths," a sentiment directly opposed to the view that the study of science can debase the mind.

In conclusion, while we have had occasion to differ in some respects from the President, we are inclined to the belief that our differences are matters of expression rather than of opinion, for we have shown that on those very points his words can be quoted in support of our contentions: and we have

to thank him for an address which contains abundant food for thought, and should be read by every member of the electrical industry.

The One-man Light-weight Safety Car.

THE technical equipment of the average British tramway undertaking has shown comparatively little progress for a good many years; and in many cases the original type of equipment is still used. At the same time, operating conditions have undergone a complete change, especially during the period of the war, and no doubt many tramway managers have given serious thought to the future of their undertakings under the conditions which may possibly exist for some years to come. We refer more especially to the smaller systems, which may be faced not only with abnormal operating costs, but also with a falling-off in the travelling habit if more stringent economic conditions prevail. If with such undertakings the problem of making ends meet has always been a pressing one, what will it be in the years to come?

Consideration of this matter leads to the reflection that British tramway authorities are, perhaps, rather too prone to follow in each other's footsteps, irrespective of conditions. It would, for instance, be surprising if the identical type of car which is a satisfactory street transport unit in, say, a city of 300,000 people, were also the best transport unit in a provincial town of, say, 30,000 inhabitants. In this connection, we cannot help feeling that the increasing use of the light-weight one-man car by the smaller American tramway systems carries with it a valuable hint to our own tramway authorities. The American problem was one of "more service at less cost," which, although arising from a dissimilar cause, *i.e.*, jitney bus competition, has many points of similarity to our own. At the present time about 150 undertakings operate cars of this type, so that their success in the States as a means to an end cannot be doubted.

The American one-man car is the result of specialised design, with a view to reducing weight and attendance, or, in other words, power, maintenance, and wages costs. The cars are single-truck single deckers, built low with 24-in. diameter wheels, and equipped with two 25-H.P. high-speed motors, which weigh about 36 lb. per H.P., as against the 58 lb. of the old standard 35-H.P. motor, and a corresponding reduction is made in controller weight. Air brakes, automatically interlocked with step and door mechanism, and, in emergency, with the power circuit and sanding arrangements, are provided, and the design obviously lends itself to high rates of acceleration and retardation, to time saving in service stops, and to safety conditions. While it is true that the pay-as-you-enter idea has not caught on in this country, it must be remembered that the system has had no fair trial here, and that the passenger has not been confronted with the alternatives of paying a higher fare or giving himself a little extra trouble.

The small tramway system has need of a more flexible car unit than the standard four-wheel double-decker commonly in use; congested traffic plays no part in its problem—rather the reverse, and this is another reason why the more nimble light-weight car, if we may judge by American enthusiasm as to its traffic-building propensities, should receive consideration here. We hesitate to accuse our tramway authorities of lack of originality, especially in view of Mr. Baker's advocacy of single-deck cars under special conditions at Birmingham (see *ELEC. REV.*, page 373), yet the fact remains that, for some reason or other, British tramway practice, with minor exceptions, remains stationary.

THE EDUCATION AND TRAINING OF ENGINEERS.

By "RADIX."

THE subject dealt with at the meeting held on October 25th at the Institution of Civil Engineers, namely, the education and training of engineers, is one of vast and far-reaching importance to the welfare of the nation, and the country owes Mr. A. E. Berriman and Mr. A. P. Fleming a deep debt of gratitude for the initiative they have taken in this matter. A pioneer's lines do not lie in pleasant places as a rule, and until the value of his work comes to be realised—more often than not years after his death—he is apt to be looked upon as a "crank," and to become an object of scorn to those who are not far-sighted, or of open hostility to those with whose interests his ideals threaten to conflict.

In the course of a lecture delivered before the Liverpool Philomathic Society in April, 1869, Huxley said: "I ask anyone who has adopted the calling of an engineer, how much time he has lost when he left school, because he had to devote himself to pursuits which were absolutely novel and strange, and of which he had not obtained the remotest conception from his instructors? He had to familiarise himself with ideas of the course and powers of Nature, to which his attention had never been directed during the whole of his school-life, and to learn, for the first time, that a world of facts lies outside and beyond the world of words. I appeal to those who know what engineering is, to say how far I am right in respect to that profession."

These words are as true to-day as they were 48 years ago.

Our whole system of education needs reform, not only with a view to afford native talent greater scope and facilities for development, but also to provide better means for ascertaining the existence of latent ability. The etymology of the word "educate" suggests the very antithesis of our present methods. Under our existing system it is largely a matter of chance whether that which lies dormant in the child's mind is "led out" or is stifled by what it is sought to "cram in." It is absurd and illogical to subject the mind of each youngster to an identical course of training. A system of education should be an intelligent, not a mechanical, one. It should stimulate and develop individuality and elasticity of thought, and not formulate a standard of knowledge of facts which merely calls for a certain degree of retentiveness in the memory.

One speaker referred adversely to the value of a college education. Another defended it, and stated that "there is nothing wrong with a college education." That is technically true. There is nothing *wrong* with it, but in most cases it results in a greater or less degree of agility in mental gymnastics which one finds wholly out of place in the storm and stress of after-life. I will give an instance, for the facts of which I can vouch:—

A man attended the three years' engineering course at one of our best-known colleges during the 'eighties. Each year he took first or second place in the class examination in heaven knows how many subjects. He was awarded two scholarships. He then spent about two years in the shops. He had previously studied for upwards of four years in France and Germany, and spoke both languages. After his shop experience he was offered the magnificent salary of £50 a year as assistant to his quondam professor of engineering. Now the really sad part of this story is that experience in after-life proved to this man that his professor was perfectly

right. He was certainly not worth more it is doubtful if he was worth even as much.*

This man has commanded four-figure retainers for many years, but he attributes this to the education he gave himself in the school of experience of the world, and of men and things.† The best men he has had as assistants have been those who did not write letters of the alphabet after their names, but who as Mr. Hadow would say were *good* men as well as skilled men; they were men of sound, healthy moral principle.

This experience, though by no means singular, should not lead to an under-estimation of the value of knowledge of theory in engineering. Without the science of engineering little progress would be made. I am contending against the inharmonious mental development which results from the kind of engineering training one receives at college. The scientific part is excellent, but the practical part is almost worse than useless. One of the speakers, in referring to a machine which had been made in the laboratory of a certain college, said that it was admirable in every respect, but there were two questions which no one was allowed to ask about it: how long it had taken to make, and what it had cost.

In view of the vast and ever-increasing accumulation of knowledge, scientific and practical, I feel very strongly that we have already entered upon an era in which any attempt on the part of one man to keep pace both with scientific research and with its application in practice, is foredoomed to failure. The specialist in practical engineering must not specialise also in science, and, per contra, the scientific engineer must not pose as a practical man. They should hunt in couples, and each should know enough about the other's field of activity to ensure intelligent co-operation.

There are two important points to which the Committee should give their attention. They should endeavour to secure State aid for carrying on experimental research on a much larger scale than has hitherto been possible with the resources at the command of individuals and firms. Secondly, we must cease from blinding ourselves to the progress made by other nations. We have been prosperous in the past in spite of, rather than because of, our methods. Those whose business it should have been to read the handwriting on the wall have wrapped themselves up in the cloak of insular prejudice, and have even refused to listen to the warnings of those who travelled beyond the confines of this island. "Blinkers off" should be one of the watchwords of the Committee.

The reference, on the part of five speakers, to the moral element in the education and training of engineers is exceedingly significant, for it shows that we are awakening to the fact that "the tree of knowledge is not the tree of life"; but the diffident and almost apologetic tone of those allusions is sadly suggestive of the growing realisation that the moral law is becoming honoured more in the breach than the observance—a fact which is at the root of most of the social evils of the day.

Take the present-day relations between Capital and Labour. Can one say, with justice, that either side is wholly in the right? Unfortunately, those

* "When a man's knowledge is not in order, the more of it he has the greater will be his confusion of thought. When facts are not organised into faculty, the greater the mass of them the more will the mind stagger along under its burden, hampered instead of helped by its acquisitions. A student may become a very Daniel Lambert of learning, and remain utterly useless to himself and all others." (Herbert Spencer, "Study of Sociology," Chap. XI, p. 267.)

† "Strictly speaking, every one must educate himself." (Hamilton, "Metaphysics," Lecture I.) The objective truth of this, as a fact of experience, and its bearing upon the vital importance of the development of Will and the formation of proper habits of mind in the young, needs no demonstration.

who have championed the cause of Labour have for the most part been recruited from the ranks of those whose minds are inharmoniously developed. It is not difficult to see clearly if one does not see far, and the fatal error underlying the well-meant efforts of these would-be reformers was to attempt to accomplish in shirt-sleeves that which a diplomat would have approached in evening dress. They sought to fight Capital instead of co-operating with it, with the very natural consequence that the party attacked adopted the same tactics. Production has thereby suffered enormously, and, what is worse, the *moral* of both men and masters has tended to degenerate.

Incidentally, both sides seem to have ignored the fundamental principle that Capital and Labour, though necessary factors in the production of wealth, are in themselves powerless to accomplish anything useful without the exercise of directive ability, just as the conception of "force" necessarily involves somebody or something that gives it direction.

(To be continued.)

THE ROMANCE OF ELECTRICAL WORK.

By A. ARNOLD.

IN the early days of electric lighting, the glamour of novelty spread itself over all dealings with the little-known science, and the pioneers of progress were afire with enthusiastic fervour, alike in their serious work and in their imaginative ideas of the future field of their activities. Romance was writ large upon the earlier applications of electrical transmission of energy and its utilisation as a lighting agency. Men dabbling with it were regarded as being of necessity a separate species of the *genus homo*, and were looked up to almost as supermen. The idea that without fire, and by nothing more than the touch of a button, light could be mysteriously tapped, appealed very strongly to the imaginations of a generation accustomed to messy oil lamps and an indifferent gas supply. The vast majority of the populace had not come into more intimate contact with electric lighting than by seeing a few meagre examples at exhibitions, or perhaps noticing a little converted public lighting. The possibilities of power transmission, electric cooking and heating, wireless telegraphy, and the many other applications of electrical utilisation of energy were not only unknown, but unsuspected, at any rate by the non-technical public. Technical men, to some slight degree, realised a part of these possibilities, but certainly never dreamt to what enormous proportions and importance the electrical supply of energy would grow. A fine spirit of almost altruistic enthusiasm was in their ranks, and their ardent zeal for the best that they knew in electrical matters and the conscientious energy with which they tackled their everyday work and the new problems that were continually arising began to infect even the phlegmatic public. The progress that was made in the popularising of electric lighting among the ultra-conservative people of this island was due not only to the intrinsic merits of the commodity, but to an even larger extent to the enthusiasm and zeal of those pioneers who undertook its development.

To-day nearly all the ardour of that glorious time has vanished. Familiarity has indeed blunted our appreciation of the romance electrical. Every man is for himself—out to make the most money out of the job, and caring nought for anything else. The altruistic ideas and ideals have all frankly disappeared, and electrical work has lost all its romantic glamour, and has become merely a method whereby Capital and Labour exploit the public purse for their own advantage. Even among municipal concerns the electricity department has begun to be considered a necessary evil, rather than the glorious opportunity it may have been perceived to be for providing one and all with a plentiful supply of energy at cost price, to the end that the locality may prosper and the community at large benefit thereby.

Companies are usually candid about their aims, which are first and last financial, and to the attainment of their ends they will even in some cases sweat their employees and grudge their plant the expansion and attention it should rightly receive. The attitude of the individual engineer, too, has become less noble, almost ignoble. Men in this kind of work, no less than in almost every other path of life, become so sophisticated that they find it practically impossible to enthuse upon any subject, and particularly so upon the work which occupies a very large portion of their lives. Where is the enthusiasm of the old society meetings? They have degenerated into solemn advanced lectures, with but very few exceptions. And the personnel of the industry in general has become infected with the 20th century "fed-up-ism," and does as little as possible consistent with keeping the despised job.

The fruits of these things are becoming daily more apparent. There is a complete lack of understanding between the men and the managements, between the staffs and the managements, and between the managements and the public. The threatened railway strike in the middle of the greatest war ever undertaken was symptomatic of the general unrest prevailing; none the less dangerous, because it is usually less vocal than in this case. The men suspect the managements of making large profits and withholding more than a fair share, the managements consider that the men are taking advantage of the lack of labour to put forward unreasonable demands. Staff men are only waiting for the proclamation of peace to change their venue; they hope to obtain improved conditions and pay, considering that their extra work and worry has not been sufficiently recognised by their present employers. The employers apparently imagine that as they have been legally able to control their staffs during the war to a large extent, such conditions will last indefinitely; and hence if the staff men do not like their present status and pay, they can do the other thing. In many cases, too (with some shining exceptions), the management's attitude to the public has been equivocal. They have not seriously attempted to keep a reasonably competent staff, nor have they sufficiently impressed the authorities with the necessity, in the national interest, for permits to obtain new plant. The first item was doubtless due to patriotic but mistaken zeal; the second has limited the output of munitions, coal, &c., and has been as bad for the shareholders as for the country at large. The public would have benefited here again had the powers that be in the electrical world been gifted with a little more enthusiasm, imagination, and common sense. All these troubles are, to a great extent, due to lack of confidence between master and man, and to the want of co-operation between administrative bodies. Industry is at civil war; peace can come by the ruin of one of the combatants (in this case ruin of one entails collapse of the other) or by wise negotiation. Could confidence be restored, negotiations could take place; but the sincerity of the delegates must be beyond reproach. While suspicion is in the air peace is impossible, for the alternative red ruin of reaction or mob rule is unthinkable.

Cannot the old hearty relations between master and man (and assistants and man) be resurrected? Is industry too far riven to rise again to nobler things? Could the old enthusiasm and pride of each individual in his own life work be rediscovered, there would be fewer mean advantages taken, suspicion would give place to a hearty confidence that each man was working for the common good, and internecine strife would cease with a mutual redistribution of opportunities and privileges. The ancient age of romance and chivalry would return, and, coupled with modern civilisation's advantages, would make this world a very pleasant place. But probably this is too Utopian to be practical.

The moral, however, is obvious. Without being pessimistic, the present labour situation—giving that term the broadest significance—cannot be described as other than serious, and it is admitted to be so by many writers, even by those of anti-Socialistic tendencies. At the conclusion of the world-war the situation will be aggravated by the demobilisation of many thousands of workers newly released from discipline, and unless some alteration takes place before then the results will probably be disastrous. The attitude of the educated classes influences the workers very extensively,

and the present staleness in the former is a root cause of the disaffection of the masses. A return to the former ideals, to keenness and enthusiasm on the part of all in authority, would be an example which would exert a very steadying influence, and which, coupled with a sympathetic handling of the grievances which may be shown to be well grounded, would probably allay the prevailing discontent. And such a revivification of enthusiasm should not be difficult to electrical men, for, after all, romance is not dead. Too close application to detail makes it difficult to take the long view, it is true, but a few moments' reflection will show that even within the last few months there have been developments in electromechanical circles which would have appeared but the wildest of dreams to the preceding generation, and a closer following of the technical periodicals is a capital remedy for those who tend to become *blasé*. The realm of wireless telegraphy has a peculiar glamour for the heavy electrical engineering devotee, and *vice versa*, and even in these days of stress and hurry, a hobby of this sort is a valuable aid to sanity and enthusiasm. The participation in technical debates of the more informal sort (of which the Friday evening discussions of the Junior Institution of Engineers are about the best example) and the cultivation of the spirit of camaraderie among members of such Associations are other methods of combating incipient staleness, while keeping within strictly professional interests. In addition, some concern of a totally different and more personal nature may be indulged in with profit, and, indeed, the man is fatally prosaic who can only derive inspiration from contemplation of his own department of life. These many suggestions are not exhaustive, of course, but may serve to show that not only the pioneers, but their humbler followers may, if they will, retain their pristine zeal, and even be able to find some *joie-de-vivre*.

GAS FIRING BOILERS.

By T. M. HUNTER, M.A., B.Sc.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS.)

GAS as a boiler fuel was first used in connection with blast furnaces somewhere about the middle of last century. Huge quantities of dust were deposited in the boiler flues, resulting in a constant decrease of the evaporation, and requiring to be cleaned out every few weeks. Under these circumstances the possibilities of the fuel were not realised. About 25 years ago, gas-cleaning plants were introduced, which did away with this disadvantage.

The introduction of regenerative coke-oven plants next provided quantities of gas, which was also used for boiler firing. It was, however, found that even with this richer gas the efficiency of gas-fired boilers was still very low.

The theory gained ground that gaseous fuel was unsuitable for boiler firing, and that it was impossible with it to obtain anything like the efficiency or the evaporation obtainable in the same boiler by coal firing.

About 20 years ago the Mond by-product producer, followed by other producers, provided another source of gas in large quantities, and in some cases this gas was used for boiler firing. The author thinks that in no case yet has gas firing of boilers with by-product producer gas been made a commercial success, but he firmly believes that there are modern producer and boiler plants even now on the market which can make the gasification and gas-firing proposition a commercial success under suitable conditions.

Gas-cleaning plants made the use of producer and blast furnace gas possible in gas engines, but the adoption of steam turbines reduced the steam per horse-power-hour from 20 to about 10 lb., and it became evident that if gas-fired boilers could raise the steam at 75 per cent. efficiency the results from a modern turbine set would be as good as those from a gas-engine set, while as regards reliability and the skilled attendance required, the steam turbine was unquestionably first.

There is no doubt that gas-fired boilers have now a greater future than ever. Probably the time is not so far distant when our present method of burning coal together with its valuable by-products will be considered obsolete, and possibly even illegal. It will then be replaced by some type of by-product producer or coal distillation plant yielding gas, and this gas will without doubt be largely used for boiler-firing purposes.

Calorific Value of Gas.—The calorific value of a gas is expressed in this country as the number of therms (B.T.U.) in 1

cu. ft. at 60 deg. F. and 30 in. mercury column. On the Continent, normal conditions are 0 deg. C. and 760 mm. mercury.

The calorific value of a gas is found by burning the gas in a calorimeter, and measuring directly the heat produced. This method reduces all the products of combustion to the temperature of the atmosphere, and thus condenses the water vapour arising from the combustion of H₂ and hydrogen compounds. The value thus obtained is called the "gross calorific value" of the gas.

In almost every case where gas is burned for practical purposes, the water vapour arising from the combustion escapes to the chimney as a vapour, and is not condensed. It has, therefore, become the custom to treat the latent heat lost through the non-condensation of this water vapour, not as a charge against the boiler, but as a charge against the gas itself. The "net calorific value" of a gas—which is the value generally quoted—is the gross calorific value less the latent heat of the water vapour of combustion.

If in any special case the products of combustion are cooled down so far that some of this water vapour does condense, a calorific value more nearly approaching the gross calorific value would have to be used, otherwise the results shown would be quite deceptive.

To calculate the calorific value from the analysis of a gas, we multiply the volume of each constituent by the calorific value of that constituent, and add together the results. The following table shows the calorific values of the common constituents of gas; and an example is added to show the method of using the table.

Gas.	Gross calorific values.		Net calorific values.	
	Therms per cu. ft.	Calories per cu. metre.	Therms per cu. ft.	Calories per cu. metre.
Carbon monoxide, CO ...	314	3,062	311	3,062
Hydrogen, H ₂ ...	342	3,012	293.5	2,613
Methane, CH ₄ ...	1,063	9,460	966	8,598
Ethylene, C ₂ H ₄ ...	1,721	15,300	1,627	14,480
Hydrogen Sulphide, H ₂ S...	659	5,860	619	5,513

CALORIFIC VALUE OF A COKE-OVEN GAS.

Analysis, per cent.	Net calorific value.	
H ₂ 49.1	0.491 × 2,613 =	1,282
CH ₄ 32.6	0.326 × 8,598 =	2,800
C ₂ H ₄ 3.1	0.031 × 14,480 =	449
CO 8.1	0.081 × 3,062 =	248
N ₂ 6.6		
O ₂ 0.5		
100.0		1,779 calories per cu. metre.
		= 537 therms per cu. ft.

The question of gross or net calorific value of the gas often leads to misunderstandings. It is advisable in all contracts that it should be clearly specified which value of the gas is to be used, so as to avoid any possibility of friction. In all the calculations given in this paper the net calorific value of the gas is used.

Value of Gas.—Let us assume a coke-oven plant of 50 by-product ovens which deals on an average with 100,000 tons of coal per year, and yields 6,000 cu. ft. of surplus gas of 450 therms per cu. ft. per ton of coal. If this gas were burned with an efficiency of 80 per cent. it would be possible to generate 220,000,000 lb. of steam from and at 212 deg. F., which corresponds to 96,500 tons of steam per year.

If the value of a ton of steam to a colliery is taken at 1s. 3d., the value of the surplus gas will be just over £6,000, and each 1 per cent. efficiency lost or gained will make a difference of £60. If the 100,000 tons of coal should produce 70,000 tons of coke, the total value of the gas will be nearly 1s. 9d. per ton of coke.

Of the heat generated in a blast furnace 50 per cent. is consumed by the process of making iron, and the other 50 per cent. is recovered in the blast-furnace gas. If we assume one ton of coke to be used per ton of iron, and the value of blast furnace coke to be 18s. per ton, 9s. per ton of iron is represented by the calorific value of the gas. If the stoves consume 30 per cent. of the surplus gas, and if 10 per cent. be allowed for losses through bell lowering, 60 per cent. is available for boiler firing, representing a value of nearly 5s. 6d. per ton of coke.

Let us assume that a ton of coke is equivalent to 27,800,000 therms; then 13,900,000 therms per ton of coke will be available in the gas, and if 60 per cent. of that is surplus for boilers and gas engines, 8,340,000 therms can be burned under boilers.

If we again assume a boiler efficiency of 80 per cent., 8,340,000 therms would give 3.13 tons of steam from and at 100 deg. C. per ton of coke. If the value of steam at ironworks is 2s. per ton, which corresponds to a coal price of 12s., and an evaporation of 6 lb. of steam per lb. of coal, we obtain 6s. 3d. worth of steam per ton of coke.

In order to realise the economical importance of the whole question, let us assume the case of an ironworks with four furnaces using on an average 3,000 tons of coke per week. The value of the coke for boiler-firing purposes is in their

case £48,750 per year, and each 1 per cent. difference in efficiency means a difference of no less than £487. It is hardly credible, yet true, that scarcely any ironworks obtains a boiler efficiency of more than 50 per cent., and that many get an efficiency much lower than this, so we see that small ironworks as described above are losing 30 per cent. of £48,750, or £14,610 worth of steam a year, which could easily be recovered. The question of gas economy is thus seen to play a most important part in the financial prospects of ironworks.

Returning to the case of the ironworks described above, the loss per ton of coke is at least 1s. 11d. when assuming an efficiency of 50 per cent. As efficiencies are frequently as low as 40 per cent., the actual losses sustained are often over 2s. 7d. per ton of coke.

The manufacture of pig-iron in Great Britain was some 10,000,000 tons a year before the war, so that if the average loss is only 2s. per ton, the formidable sum of £1,000,000 a year is sent up the stacks of the ironworks of Great Britain.

Very few people at present use producer gas for boiler firing. On the other hand, at many works there are considerable amounts of waste products, like belt pickings, coke breeze, shale, &c., which are very rich in combustible matters, and yet unsuitable for boiler-firing purposes. Any proposition would be welcome which would render it possible to turn these waste products to profitable account without endangering the stability of the steam supply.

The fallacy of a producer gas proposal for boiler firing without absolute security of the results obtained in the boilers is evident if the following figures are taken into consideration. A modern producer will yield nearly 75 per cent. of the heat contained in the fuel as heat in the gas, and with the old combustion arrangements hitherto in vogue no higher efficiency than 50 per cent. can be counted on, so that only 37½ per cent. of the heat in the fuel appears as heat in the steam.

If we take a fuel containing 12,000 therms per lb., the total steam raised in a gas-fired boiler per lb. of fuel in the producer would not exceed 4½ lb. from and at 212 deg. F. Then, again, 1½ lb. of this had to be returned to the producer in the blast, so that the net evaporation for outside purposes was only 3 lb. per lb. of fuel. Under ordinary circumstances the same fuels fired into boilers would have given 7 or 8 lb. of steam per lb. of fuel. With modern combustion arrangements an efficiency of 50 per cent. with producer gas can be raised to 75 per cent., so that fuel of 12,000 therms will give 7 lb. of steam per lb. of fuel; and as with the latest by-product recovery producers the steam necessary for producing by-products has been reduced to the amount necessary to drive the blowers, &c., the actual yield would be over 6½ lb. of steam per lb. of fuel. The result in steam for outside purposes is not materially worse than if the fuel had been burnt in the boilers, and the by-products are available to provide for depreciation, interest, and profit.

Suitability of Gas for Boiler Firing.—Coke-oven gas gives comparatively higher efficiencies than the two other kinds of gas in gas-fired boilers owing to the greater ease with which it can be burned. The nature of the gas, however, renders it difficult to make burners which will deal with large quantities of gas. The comparatively narrow flues of Lancashire boilers offer so much resistance to a speedy expansion of the burning gas that unless we use forced draught the evaporation from coke-oven gas in Lancashire boilers is confined to 5,000 to 6,000 lb. per hour. If, therefore, new boilers are contemplated it will always be advisable, provided that the quality of the water permits it, to choose water-tube boilers. Coke-oven gas is particularly suitable for firing water-tube boilers, and with suitable combustion arrangements evaporations of 5½ lb. per sq. ft. of heating surface can easily be obtained at the highest efficiency.

Blast-furnace and producer gas though of comparatively low calorific value, provided that they are clean and supplied under suitable pressure, will give good results, both in Lancashire boilers and in water-tube boilers. With Lancashire boilers evaporations of over 8,000 lb. per hour can be obtained, and with water-tube boilers 5 to 5½ lb. per sq. ft. of heating surface.

Blast-furnace gas we have to accept as it comes from the furnaces. It is so important that the iron made should be exactly what is required, that the kind of gas produced is never likely to be a matter of much concern to the blast-furnace manager. We must accept the fact that occasionally the gas is hardly combustible at all, and we must devise means to deal even with this condition.

The matter is different in dealing with producer gas. Gas is here a valuable product, though only the second product in point of value. The manager of the producer has it in his power to give us a gas which is much more or much less suitable for boiler firing. We naturally wish the richest possible gas, as it is the easiest gas to burn. At one large Mond plant the gas was found to be just under 100 therms per cu. ft., while at many plants the gas is over 150 therms per cu. ft.

Apart from the question of calorific value, there is the question of the constituents of the gas. Two gases of similar calorific value can be shown which would give very different results on combustion. By-product producer gas is made by blowing steam and air into the producer fire, and the resulting gas contains hydrogen and CH₄. These gases, on burning, form respectively 1 and 2 cu. ft. of water vapour per cu. ft.

of H₂ and CH₄, and the latent heat absorbed in forming this vapour, viz., 966 therms per lb. of vapour, is at present one of the inevitable losses in the use of the gas. The only way in which this heat could be recovered would be by cooling the chimney gases sufficiently to condense the water vapour, and this is impossible with our present economisers. To show the losses which are inevitable from this cause, the author gives the analyses of several gases, the net calorific value, and the number of therms lost by latent heat in the water vapour caused by combustion.

	Coke-oven gas.	Blast-furnace coke-gas.	Moore producer gas.	Mond producer gas.
	Per cent.	Per cent.	Per cent.	Per cent.
CO ₂	—	12	12·7	16
CO	8·1	29	15·5	8
H	49·1	1·5	20·2	23·4
CH ₄	32·6	0·7	2·2	3·2
C ₂ H ₄	3·1	—	—	—
N ₂	6·6	56·8	49·4	49·4
O ₂	0·5	—	0·2	—
Calorific value (cold gas)	Therms. 540	Therms. 112	Therms. 132	Therms. 130
Loss by latent heat in vapour of combustion	58½	1½	12½	17

This table shows the great value of the losses from this cause. A gas is more valuable for boiler firing which has a greater proportion of CO to H₂, other things being equal. Producer buyers should look carefully into this point when specifying new plant. A certain amount of steam must be blown into the producer in order to recover the ammonia, but at present far more is used than the amount necessary for this purpose in order to cool the fire. The author believes that some other method should be adopted for this cooling. The Moore producer, mentioned above, does part of this cooling by means of a water jacket. It has been suggested that much of this cooling could be done by some method such as by blowing in boiler flue gases carrying, say, 15 per cent. of CO₂, and taking advantage of the absorption of heat which occurs when CO₂ is reduced to CO in the presence of heated carbon. This is known in America as the Eldred process. In this way the gas should be improved and much steam saved. The question, however, is still in the region of experiment.

(To be continued.)

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

The I.E.E. Discussion on the Metric System.

In the note published in your current issue under the above heading, reference is made to the lecture I had the honour of delivering before the members of the Institution of Civil Engineers and Kindred Institutions in March last.

My lecture was subsequently reproduced in pamphlet form, of which I enclose a copy, and, in the event of any of your readers being particularly interested in the approaching I.E.E. discussion, I should be glad to supply copies, as far as my stock permits, on hearing from them.

The inclusion of this subject in the I.E.E. syllabus for December 13th is welcome, as affording a further opportunity for its complete ventilation at a time when it is receiving considerable attention. I venture to hope those participating in the debate will devote their attention to the suggestion of ways and means of overcoming such difficulties as are incidental to any change, rather than to criticisms of the destructive order which would merely postpone, and therefore render still more difficult, our inevitable adoption of this overdue reform.

Harry Allcock, M.I.E.E.

Hale, Cheshire, November 21th, 1917.

Training Chinese Engineering Representatives for Chinese Trade.

Some time back a point was raised in the local Press comparing the output of engineers from the Eastern universities with the opportunities for employment in any of the engineering branches. More men are being turned out than employment can be found for, with the result that a large number of them have to accept posts other than those for which their training primarily fitted them.

It is obvious that the future commercial war and struggle for new markets will result in the opening up of China, and

that the struggle will involve great efforts on the part of the competing nations. Up to the present, trading in this country has been carried out through the agency of native intermediaries, and in view of the great extent of the country, the difference in tongues, &c., it is difficult to see how these agents can be dispensed with. There can be no doubt that the nation that can get at the natives by Chinese intermediaries possessing a good commercial and engineering training stands the best chance of getting the market, and for this reason I think that British manufacturers should take advantage of this surplus of raw material, who depart from Eastern universities, and make them offers of training in their works, &c., in commercial and engineering practice. In return for these facilities the native engineers should act as representatives for the firm by whom they were trained for a specified term. The offer, I believe, would be eagerly accepted, and the monetary outlay would be small in comparison with the benefits that would accrue later. The Western nations who will compete in this field will need every ounce of their energy to stem the rising tide of Japanese trade with China. The Japanese have a college at Shanghai for specially training their own countrymen for work in China, and over 900 students have been passed through who are now working in various parts of the country. This scheme has proved so successful that the erection of larger colleges is under consideration. Seeing that such a step is impossible in our case, I think an experiment on the lines I suggest above would be justified by the result.

Portable Electric Lamp Cooking Box.

I have read with interest the description in your issue of November 9th of Mr. Edwards's cooking box. I am fully convinced that this is the system by which cooking will be carried out in the future: the present wasteful and haphazard methods of cooking are a disgrace to a civilised race, and the need for economy in coal is making people wake up to the fact.

I have been working on the same lines as Mr. Edwards for the last 18 months, and have arrived at the same general arrangement, but have adopted two distinct additional features, viz., an automatic temperature control and an automatic starting arrangement.

In my automatic cooker I use only a 16 c.p. lamp in a completely insulated box, in which the cooking utensils are very nearly a fit, the air space being small. In a pocket in the heat-insulating material there is a thermal strip which, when the temperature reaches a predetermined figure, cuts off the lamp on the thermo-blink principle, maintaining the temperature a little below boiling point. This prevents anything in the cooker from boiling over. If Mr. Edwards tried to cook porridge with his arrangement I am afraid he would find that it had boiled over when he opened it.

In addition to this, I have an alarm clock arranged with a contact which is closed by the alarm. The arrangement makes an excellent breakfast cooker, and to anyone without a servant, or with one that won't get up in time in the morning, this automatic should be a boon.

At night the oatmeal or Quaker Oats is put in the bottom container with the necessary quantity of cold water and salt, and in the top the rashers of bacon or fish, &c.; the plates are put on top, and the whole closed down. The alarm is then set for, say, 6 o'clock, and at 8 o'clock you can come down to find your breakfast ready, perfectly cooked, and piping hot. One would be inclined to think that the oatmeal would be lumpy, but this is not so, and bacon cooked in this way is not distinguishable from that fried in the ordinary way. The cost of current for cooking breakfasts for two is less than 3d. a week, with current at 1½d. per unit. To anyone tasting a steak or chop, for the first time, that has been cooked by this slow method it comes as a revelation.

This automatic cooker will be especially useful to anyone who is uncertain as to meal hours; food can be left in four or five hours after it is ready, and come out exactly the same as if just ready. To be able to come home at any time of the day or night to a hot meal without any preparation, cooked at the cost of a fraction of a farthing, should put electricity for cooking in a position from which it will be difficult for the gas engineer to oust it.

Patent has been applied for, and this automatic cooker will shortly be placed on the market.

Percy Watson, A.M.I.E.E.

(NORTHERN ELECTRICAL CO.)

Grimsby, November 12th, 1917.

German Cables Specified in War-time.

I see it constantly stated that the people of the country are determined to have no further trade with Germans, but I am afraid that unless this is made in some way compulsory, we shall find ourselves in a short time doing as much trade with them as ever.

I received a specification for certain new work in a private house, from a leading Leeds architect, and to my great astonishment the cable is specified to be manufactured by

the Lahmeyer Electrical Co., which I think I am correct in assuming is, or was, an enemy concern, and, as far as I am aware, has been wound up as such.

It is, of course, quite reasonable to suppose that this architect has never taken the trouble to read his specifications, but it is rather an unfortunate commentary on our past methods of trading when anyone reflects that it was possible at any time to insert a clause in a specification compelling the tenderers to purchase German goods.

This is more apparent when one considers the large number of high-class cable makers there are in this country.

R. Falshaw.

Harrogate, November 20th, 1917.

[It is difficult indeed to understand how any British architect could be induced to specify that German cables must be used, in peace time; but how such a clause could be allowed to stand in war time passes comprehension. We fully agree with Mr. Falshaw that, in face of such a clause, the necessity of compulsory measures for the protection of British manufacturers is manifest.—EDS. ELEC. REV.]

The E.T.U. or the A.E.S.E.?

Your article is most opportune, and most people will welcome it as a basis from which to attack the problems of the central-station engineers. I was also interested to read that, as regards the workmen in central stations, there was not the same trouble, as they favoured trade union methods; also that there were several unions who catered for them.

In passing, I should like to say that I fail to find any real difference between a trade union and an association, both primarily being formed to safeguard collectively the individual worker. I will admit that trade union methods of the past (and the present, in some cases) leave much to be desired, but there are signs and portents that the future will find better methods in vogue, in which the employer and arbitration will take more prominent parts.

But I certainly think that the central-station workmen should also start to organise themselves, as the wages question, for instance, is just as bewildering between the various stations as is the case of the technical staffs. At present, when a central-station worker joins a trade union he immediately finds himself alone, paying for a programme which is often quite outside his compass, having no voting power to forward his own particular ideals, and generally having to accept a condition of affairs which is lower than is now his, and with no one to really trouble about his troubles and grumbles in the future.

I would be greatly obliged if you would find a place in your valuable journal to put this letter (I sincerely apologise for its length), in the hope that it might produce evidence of members of the engine and boiler-plant departments of central stations who have similar ideas, in which case, should they desire, we might arrange a meeting to discuss a means of uniting ourselves in one union, or to a union who would form a branch for central station employees only, on similar lines to the Electrical Section of the National Union of Railwaymen.

Progress.

Resistances in Parallel.

In your issue of the 9th inst. there is a letter, accompanied by a calculating chart, from Mr. L. O. Meyer. In the letter he speaks only of two resistances in parallel, but his chart can be used for any number of resistances in parallel. Take five resistances of 2, 4, 5, 8, and 10 ohms respectively: the first pair taken off the chart give 1.33 ohms, the next pair 5.08 ohms. The joint resistance of these two gives 0.93 ohm. Taking the last figure and the remaining resistance, viz., 10 ohms, gives us 0.85 ohm, which is the resistance of all five in parallel.

A. G. Hilling.

Stanford Hill, November 26th, 1917.

The Sensibility of the Eye.—A recent publication of the Bureau of Standards (Scientific Paper No. 303), entitled "Relative Sensibility of the Average Eye to Light of Different Colours, and Some Practical Applications to Radiation Problems" gives data on the spectral sensibility to radiation of the average eye, as based upon a group of 130 observers. The relative visibility curves were determined with a flicker photometer and an equality-of-brightness photometer. The data indicate that 60 per cent. of the cases examined fall into three quite evenly divided groups, which are either (1) red-sensitive, (2) blue-sensitive, or (3) average; while 30 per cent. of the cases examined are quite evenly divided into three groups which fall below the average sensibility in either (1) the red, (2) in the blue, or (3) in both the red and the blue, thus giving rise to an apparently high sensibility in the green. A mathematical equation is given of the average visibility curve, which is applied in a separate paper in calculating the luminous energy emitted by a black body at various temperatures; also the luminous efficiency, the Grova wave-length, and the mechanical equivalent of light. The value of the latter is about 50 candles per watt of luminous energy of maximum visibility.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

Sampson Acid and Water-Proof Lampholder.

MESSRS. WARD & GOLDSTONE, of Salford, Manchester, have recently introduced the patent acid and water-proof lampholder shown in fig. 1. It includes a vitreous porcelain shell, the upper part or chamber of which, enclosing the top of the ordinary lampholder, is filled with a sealing compound, while an acid-proof rubber shield hermetically seals the lower portion of the lampholder, fitting between the porcelain shell and lamp bulb. The interior lamp

FIG. 1.—ACID AND WATER-PROOF LAMPHOLDER.

holder is locked in position in the shell by means of two shade rings, the upper one having projecting claws which fit into a slot in the porcelain, preventing the lampholder from turning round in the shell when screwed into position.

The holder is easy to wire and takes standard tough rubber jacketed flexible cord; it is suitable for use in chemical works or exposed positions.

Bennis Portable Elevators.

Many industrial processes involving the handling or transport of materials could be performed with greater speed and efficiency, and with a large saving in labour, but in many of these cases the installation of a fixed or elaborate conveying system would not be practicable or justifiable, owing to the changing venue of operation, or the irregular, possibly infrequent, and not always calculable, periods when its use would be required. Such conditions are admirably met by the use of portable elevators or conveyors. They can be brought into use, as, and when required; they can be moved

FIG. 2.—PORTABLE ELECTRIC ELEVATOR.

from place to place with the greatest ease, and they can be arranged so that the work of loading and unloading can be carried out by merely reversing the running.

A small portable coal elevator of this type made by MESSRS. F. BENNIS & CO., LTD., of 28, Victoria Street, S.W. 1, is shown in fig. 2. It is 10 ft. long between the centres of the drums, and has buckets 8 in. wide.

The framework of the elevator consists of rolled steel channels and angles braced together. The top and bottom of the elevator is formed out of cast-iron plates.

The bearings for the shafts are cast on the plates, and the whole is bolted together to form a self-contained structure.

The elevator is mounted on a portable truck in such a manner that the angle of the elevator can be altered if desired.

The truck is built out of mild steel sections and is carried on four rollers attached to pivoted axles. The top of the axle is made with a square so that it can be turned round with a spanner, and provision is made for locking the wheels in four positions. The axles work independently of each other.

The elevator is driven by two chain drives. Two sprocket wheels are placed on the pivot shaft. One of these sprockets is driven direct from the motor, and the other sprocket drives the elevator shaft, so that the relative centres of the shafts are maintained irrespective of the angle of the elevator.

When in operation the elevator is pushed up to the coal heap, and the coal trimmed forward to the buckets.

LEGAL.

BIRMINGHAM RAILWAY CARRIAGE AND WAGON CO., LTD., *v.* ROUND.

In the Court of Appeal, before Lords Justices Swinfen Eady, Warrington, and Scrutton, on November 21st, there was heard the appeal of the respondent in this case from the award of Judge Howard Smith, sitting at the West Bromwich County Court as the Arbitrator under the provisions of the Workmen's Compensation Act.

The appellant, Round, who was in the employment of the applicants as an electrician's assistant, on October 29th, 1916, met with an admitted accident which resulted in his right hand being crushed, the little finger being rendered permanently useless and the ring finger being also somewhat seriously damaged. Round at the time of the accident was 22 years of age. The employers paid him half wages of 16s. 7d. per week down to May 23rd, 1917, when they filed an application to redeem the weekly payments by a lump sum payment. The County Court Judge, after hearing the medical evidence, found there was some partial earning incapacity of Round as a result of the accident, but that it was not permanent, and he assessed the compensation payable by the employers to him at the sum of £80, for which amount he made his award, without making any order as to costs. From this decision Round now appealed, upon the ground that in the circumstances the County Court Judge should have assessed the compensation payable by the applicants to him upon the basis that, as a result of the accident and the injuries he had sustained to his hand, he was partially permanently incapacitated from earning the wages in the future which he would in the ordinary course expect to earn as a skilled man in his trade.

At the conclusion of the arguments of counsel, their Lordships held there was evidence upon which the learned County Court Judge could justify his award, and dismissed the appeal, with costs.

METROPOLITAN WATER BOARD *v.* DICK, KERR & CO., LTD.

JUDGMENT was given in the House of Lords, on Monday, in an appeal by the Metropolitan Water Board from an order of the Court of Appeal.

Mr. P. O. Lawrence, K.C., Mr. Holman Gregory, K.C., and Mr. Joshua Goodland appeared for the appellants; Mr. Upjohn, K.C., Hon. F. Russell, K.C., Sir Ernest Pollock, K.C., and Mr. Douglas Hogg, K.C., for the respondents. The facts of the case have already been reported.

The LORD CHANCELLOR, in moving that the appeal should be dismissed, said the question in this case was whether a contract for the construction of reservoirs and waterworks between the Metropolitan Water Board, the appellants, and Messrs. Dick, Kerr and Co., Ltd., the respondents, could be treated by the respondents as at an end, in consequence of an order of the Minister of Munitions that work under the contract should cease. The action was begun by the Metropolitan Water Board by writ dated May 19th, 1916, against the contractors, and the statement of claim asked for a declaration that the contract was still in existence as a binding contract, and had not been determined. The defence alleged that notice from the Ministry of Munitions, dated February 21st, 1916, was given in exercise of the powers conferred by the Defence of the Realm Acts and the regulations and orders made thereunder, and that the notice required the contractors to cease work on their contract, and that they ceased work accordingly. The defence went on to allege that thereby the contract ceased to be binding. The case was tried by Mr. Justice Bray, who gave judgment for the Metropolitan Water Board, holding that the notice should have been dealt with under the terms of the contract by an extension of time for the completion of the contract, and that the contract was still in existence. On appeal this decision was reversed by the Court of Appeal, consisting of the Master of the Rolls, Lord Justice Warrington, and Lord Justice Scrutton. The appellants by the present appeal asked that the decision of Mr. Justice Bray should be restored.

HIS LORDSHIP having dealt with the contract and with the authorities, said that the principle had been well established. The contract in the present case was for the completion and handing over of these works within six years from August 16th, 1911. The effect of the prohibition might be that the works could not be resumed until, at all events, the greater part of the six years had expired, and by that time all conditions as regards labour and material might be absolutely different. This, in the words of Mr. Justice Rowlett, would be "not to maintain the original contract, but to substitute a different contract for it."

In his opinion, this appeal should be dismissed, with costs.

The other noble and learned Lords gave judgment to the same effect.

Order accordingly, with costs.

ELECTROLYTIC CORROSION OF TELEPHONE CABLE.

AT Preston County Court, last week, his Honour Judge Hugh Sturges gave his reserved judgment in the case heard by him a fortnight ago at Blackpool, when the Postmaster-General sought to recover £16 18s. from the Blackpool and Fleetwood Tramroad Co., Ltd., for the cost of repair of telephonic lines alleged to be necessary through a leakage of electric current from the defendants' lines. (ELEC. REV., May 16th, page 165.)

HIS HONOUR observed that the tramroad was constructed in 1896. In 1914 the Postmaster-General caused to be laid within 7 ft. of the defendants' electric tramroad a lead piping containing telephonic cables. No notice was given to the defendant company before the cable was laid as to its position, or method of insulation. Two years after the cable was laid a breakdown occurred through the lead piping having corroded, due to a leakage of electricity from the defendants' lines, and the action was to recover the costs of repairing the injury. His Honour found that there was no evidence that the defendants had not complied with the provision in their Act that they should construct and run their undertaking with due regard to telegraphic lines, and it was shown that monthly tests were made and submitted to the Board of Trade to show there was no excessive leakage of current. The plaintiff's alternative claim upon that provision failed. The other alternative claim, founded upon Sec. 8 of the Telegraph Act, 1878, also failed, as he found that the section, which related to the liability for the cost of repair of injured telegraph lines, could not over-ride the provisions of Sec. 65 of the Tramroad Co.'s Bill, in which Sec. 8 of the Telegraph Act was deemed to be incorporated. Sec. 8 was only applicable for contingencies arising that were not provided for in the section of the company's Bill.

HIS HONOUR accordingly gave judgment for the defendant company, with costs, and also granted leave to appeal, if desired.

A MARCONI APPEAL.

IN the Court of Appeal, before Lords Justices Pickford and Bankes, on Monday, the matter of a petition of right of Marconi's Wireless Telegraph Co., Ltd., was heard upon the appeal of the company from an interlocutory order of Mr. Justice Atkin, dated December 7th last year, directing that the petition should be tried before a Judge sitting without a jury. The suppliant company contended that the question of fact in the petition should be decided by a jury.

MR. LESLIE SCOTT, K.C., in support of the appeal, said the subject of the dispute arose out of an agreement made on July 30th, 1913, between the suppliants and the Postmaster-General. The issues involved were considerable. If the agreement was treated as one that would run for 18 years, upon the conservative estimate made on behalf of the company, it resulted in something like £1,500,000 in the way of damages; and if the view was taken that the company was entitled to royalties for 28 years, the damages might be over £2,000,000. Important points were involved in the case. He contended that the company had the absolute right to a jury, and that the learned Judge had, in refusing to allow the case to go before a jury, exercised his discretion wrongly, and alternatively if it was a matter of discretion, on the facts of the case, it was plainly a case for a jury. The agreement was for the company to erect six stations in the great wireless chain—England, Egypt, the East African Protectorate, the Union of South Africa, India, and Singapore, or some neighbouring point of the Malay Peninsula—and there was a proviso that the Postmaster-General might cancel the contract in respect of three stations, and it was as though the action was an ordinary one for damages for breach of contract. The pleadings set out the agreement, and that the suppliants had placed large orders for the contract, and instead of the Postmaster-General cancelling the three supernumerary stations, he decided that the one in India should be proceeded with. England, Egypt, and the East African Protectorate, he suggested, were definite orders. By saying India should be proceeded with, the Postmaster-General, he submitted, had waived his right to repudiate. In preparation for the installations the company did a great deal of work, and supplied large quantities of materials. When the Postmaster-General repudiated the agreement the company had spent £140,000, of which they received from the Government about £62,000, and the company claimed a declaration, leaving the damages to be arranged or assessed in such way as might be thought fit or expedient. The Postmaster-General repudiated the whole agreement in a letter dated December 30th, 1914, after the outbreak of the war. The suppliants were told not to proceed with the wireless stations. The letter said:—"I am directed to inform you the Government has decided not to proceed with the Imperial Wireless Chain." If any question was raised as to what precisely

was repudiated, and what the company was not to proceed with, that sentence, said counsel, obviously meant the whole thing.

LORD JUSTICE PICKFORD: May the letter not mean—We rely upon that as cancellation of the three, even if we cannot give up the whole six?

MR. SCOTT contended that the position was untenable. The suppliants had lost the benefit of the whole agreement. They wrote on January 11th, 1915, claiming compensation for the abandonment of the agreement, and the Postmaster-General thereupon withdrew his letter of December 30th, and offered to co-operate with the suppliants in carrying out the terms of the agreement with all promptitude. In the agreement there was a provision that as to South Africa, India, and Singapore, the Postmaster-General might, by notice in writing, before the establishment of these three long-distance installations, cancel the agreement relating to them. Here it was no work no pay, but for work already done the company was to be indemnified. Regarding the continuous-wave system this clause appeared: "The Postmaster-General, if he contemplates the use of the continuous-wave system in any of the said stations, shall not give any preference to any company over the Marconi Co. if the Marconi Co. are able and willing to show they can provide a Marconi system of continuous wave with equal efficiency and economy." At the time of the agreement there was no continuous-wave system commercially practicable.

The SOLICITOR-GENERAL contended that this was a case in which the learned Judge had exercised his discretion properly, and that the petition should be tried before a Judge alone. The Solicitor-General further submitted that Section 7 of the Petition of Rights Act gave the learned Judge the discretion which he had exercised, and, in the circumstances, he contended their Lordships should not interfere with the discretion which he had exercised.

MR. LESLIE SCOTT having replied on behalf of the suppliants,

LORD JUSTICE PICKFORD, giving judgment, said the case really resolved itself into an action by the company for damages for breach of contract. He thought himself it was eminently a case to be tried before a Judge sitting without a jury; but whether that was so or not, he did not think it was a case in which the Court should interfere with the discretion which had been exercised by Mr. Justice Atkin, and that being so, the appeal would be dismissed, with costs.

LORD JUSTICE BANKES delivered judgment to the same effect.

WAR ITEMS.

Australia and Enemy Trade.—The "Financial Times" states that the Committee of the Australian Associated Chambers of Commerce has issued a report emphasising the necessity of cutting off all trade with the enemy after the war.

Trading with the Enemy.—The "London Gazette" for November 23rd contains further names of persons and bodies in the following countries with whom trading is prohibited:—Argentina, Paraguay and Uruguay, Bolivia, Brazil, Chile, Colombia, Hayti, Morocco, Netherlands and Netherlands East Indies, Norway, and Spain.

"County" Men and the War.—We have received a copy of No. 5 of the Staff War Bulletin of the County of London Electric Supply Co., Ltd., and associated companies. The Roll of Honour now contains 467 names, 58 having joined the Forces since the issue of the Bulletin in December last. Thirty-two men have been killed in action, and 62 wounded; 26 hold commissions. The pamphlet contains portraits of some of the men and other interesting photographs.

Germany and Switzerland.—A "Times" article on "German Methods in Switzerland; Art of Peaceful Penetration," concludes as follows:—"All the best concert parties come from Germany. The finest sites round the Lake of Zurich have been bought by Germany. A hundred Germans acquire Swiss citizenship every month to 10 of all other nationalities put together. Germans all but acquired the new port of Basle, and were only thwarted at the eleventh hour by the burghers themselves, who are now to build it with their own funds. Half the power generated by Swiss stations on the Rhine drives German machinery or lights German cities, and there is one 'Swiss' electrical syndicate with seven Swiss and 16 German directors! Where will it all end? The fearless patriotism of the New Helvetic Society may postpone the threatened tragedy; can it avert it?"

Engineers' Bonus.—The Ministry of Munitions has announced that the War Cabinet has decided that the bonus of 12½ per cent. on earnings shall be paid to men aged 21 years and over who are employed on munitions work as plain time workers (and not otherwise), skilled, semi-skilled, or unskilled, in shipbuilding and ship-repairing, and that the bonus of 12½ per cent. on earnings already given to certain skilled men under the Skilled Timeworkers' Wages Order of October 13th shall be paid to men aged 21 years and over who are employed on munitions work as plain time workers (and not otherwise), skilled, semi-skilled, or unskilled, in engineering shops, boiler shops, and foundries, whose wages it has been the practice to regulate by the movements in wages in the engineering and foundry trades. The bonus will be payable as from the beginning of the first full pay following October

12th, 1917. The Order carrying out the details of the above decision will be issued as early as possible. Until it is issued no payments are to be made.

The Government have decided to appoint a committee to interpret Orders regulating the bonus, to settle to whom such Orders are to be applied, and generally to smooth over difficulties regarding their interpretation. The committee will consist of representatives of the Ministry of Munitions, the Ministry of Labour, the Admiralty, and the War Office. Any communication which it may be desired to address to the committee should be forwarded to The Chief Industrial Commissioner, Ministry of Labour, Montagu House, Whitehall, S.W.1.

After the War.—Prof. A. W. Kirkaldy, Professor of Finance at the Birmingham University, speaking to bankers in Leeds last week, on "Industrial and Commercial Reorganisation After the War, particularly as affecting Finance," said many people thought that after the war millions of men would immediately return, that the women now working would be thrown out, that the new arrangements would go, and that the old-fashioned tools and methods would come back. That was impossible. If it were possible it would be disastrous. It would take some years to get the men back. When the fighting was finished large numbers would be wanted as a police force, and when that was over we should require an army of at least a million men for this generation. Personally he had no fear whatever about unemployment, if only they could avoid what some people thought was going to be a great fight between Capital and Labour. Such a fight would spell disaster. They might win the war, and yet the enemy might get all the fruits. In Europe there would only be two countries that would be able to take part in world competition—Britain and Germany. The Germans were a resolute and disciplined people, and they would do all they could to re-create the position they had lost, and if we were foolish enough to fight among ourselves they would do it.—*Leeds Mercury.*

Dr. Addison has announced the appointment of an Advisory Committee to consider the disposal of surplus Government property and stores after the war. The Committee will consider methods not only for putting surplus war stores and property on the public market in a business-like manner, thereby avoiding loss and waste, the flooding of markets, and so on, but also for insuring that the things disposed of are allocated to the fullest and best possible use that can be made of them in view of national needs at the time. Figures have been published from time to time showing the colossal scale of the Government's war purchases. War day by day consumes great quantities of these purchases—food, munitions, stores, and the like—but when peace comes many of them, including all the reserve stocks and stocks "bought ahead" will be unconsumed. Other purchases of war, on the other hand, are not consumed from day to day, and will reach the day of peace but little impaired, for example, machinery, ships, and the Government's war properties of lands and buildings which now cover an area of approximately 170 square miles. Some of these war purchases will be needed for continued Government use; others may profitably be reserved for future use. But vast quantities will have to be disposed of. So big a liquidation of war effects should not take place without most earnest consideration and forethought. Every available brick and beam and machine will be needed by the nation, and every ounce of food; for the shortage in these things will not be made good merely by the signing of a treaty. The Committee will therefore seek to hasten the preparation of inventories by the many Government Departments having war stores and property under their control.—*Morning Post.*

Women's Work on Engineering Munitions: Permanent Memorial. It is part of the scope of the Women's Section of the National War Museum that it should contain a permanent collection of engineering exhibits, illustrating the proficiency attained by women in work of an engineering nature in connection with the manufacture of munitions of war. The range of women's work on munitions and on other engineering work necessary to the war is so vast that a special committee has been formed to undertake the work of collecting suitable specimens, and firms are invited to assist this committee by submitting particulars of such examples as they would be willing to present to the National War Museum. The collection is only intended to illustrate the nature of work which women have undertaken since, and in consequence of, the war, and it will include details of aero-engines, aeroplanes, steam and other engines, motor vehicles, machine tools, guns, small arms, projectiles, gauges, cutters and small tools, gun-sights, and other articles coming within the limitation mentioned. The name and address of the firm giving the specimens may be recorded in a manner approved by the Committee, either on the specimens or on the case containing them. It is hoped that firms employing women on engineering work in connection with the making of war material will be willing to contribute specimens which will constitute a permanent memorial and record of the work women have done in the war. Communications should be addressed to the Hon. Secretary of the Women's Work Subcommittee, National War Museum, 9, Queen Anne's Gate, London, S.W.1. It is desired that samples should not be sent in the first instance.

Financial Facilities for Trade after the War: A New Committee.—The Treasury and the Minister of Reconstruction have appointed a committee to consider and report whether the normal arrangements for the provision of financial facilities for trade by means of existing banking and other financial institutions will be adequate to meet the needs of British industry during the period immediately following the termination of the war, and, if not, by what emergency arrangement they should be supplemented, regard being had in particular to the special assistance which may be necessary:—(a) To facilitate the conversion of works and factories now engaged upon war work to normal production. (b) To meet the exceptional demands for raw materials arising from the depletion of stocks. The committee will consist of the following:—

Sir R. V. Vassar-Smith (Chairman of the Committee), Chairman, Lloyds Bank, and President of the Institute of Bankers.
Sir J. Bradbury, Joint Permanent Secretary to H.M. Treasury.
Mr. A. E. L. Chudlton, Director of Ruston, Proctor & Co., Ltd., agricultural machinery manufacturers, Lincoln.
Mr. E. B. Fielden, Deputy Chairman of the Lanes, & Yorks. Railway.
Sir Algernon Firth, Chairman of the Associated Chambers of Commerce of the United Kingdom.
Mr. R. Fleming, chairman of several well-known investment trust companies.
Mr. A. C. D. Gairdner, Managing Director of Union Bank of Scotland, Glasgow.
Mr. F. C. Gouldenough, Chairman, Barclay & Co., Ltd., Bankers.
Sir Alex. McDowell, K.B.E., member of the firm of Carson & McDowell, solicitors, and well-known in the linen trade.
Sir Alexander Roger, of the Ministry of Reconstruction.
Mr. John Sampson, representative of the Controlled Establishments Association.
Mr. A. W. Tait (G. A. Touche & Co., chartered accountants), director of a number of large commercial undertakings.

Exemption Applications.—At Camberwell, the South Metropolitan Gas Co. appeared to show cause why 34 certificates of conditional exemption granted to public street lamp-lighters should not be withdrawn. Mr. Albert Stokes, on behalf of the company, stated that the men now held certificates of protection from the Munitions Area Recruiting Officer. The company had been able to train substitutes to take the places of these men, so that, as far as the company was concerned, these men could now be released for the Army. The men were not lamplighters in the ordinary meaning of the word, for they were engaged on repairs. In a sense they were tinsmiths, and thus came under the schedule of the protected trades. If the certificates were withdrawn by the M.A.R.O. the men would have to join up, but so long as they retained them they could leave the company and get work elsewhere. The Town Clerk said the men had still the right to lodge an appeal for exemption with the Tribunal on domestic grounds, even if the certificates were withdrawn. It was not fair now, when the company were prepared to release the men, that they should be permitted to hold the certificates, and get work with another company who had not been patriotic enough to train women to do the work. Sir Evan Spicer said he agreed, but, at the same time, the thanks of the Tribunal were due to the company for their patriotic action not only in releasing these men, but for their attitude since the outbreak of war. They had done everything they could to release men for the Army by training women and other substitutes. He proposed that the Tribunal tender their thanks to the company. The Chairman (Ald. Maloney) said the company had done their duty all the way through. Mr. Stokes, in stating that he would convey the resolution to his directors, said he hoped in the not very distant future they might be able to release a few more men. The conditional exemption certificates were then withdrawn, and the National Service Representative undertook to communicate with the M.A.R.O. with a view to the certificates under the Protected Trades Schedule being withdrawn.

At Bispham, near Blackpool, the manageress of a local hydro appealed for the electrical engineer employed there, who maintained 1,200 lights. He was classified B.1. The man had been in the company's employ for 18 years, and the manageress admitted that no attempt had been made to get a substitute, as it was necessary to have an efficient man about the place for the comfort of visitors. The Military Representative said the comfort of visitors was a secondary consideration in these times. Temporary exemption to March 1st was given.

Barnstaple Borough Tribunal has granted exemption until March 31st to J. D. Bushell, assistant at the Corporation electricity works. He was called up under instructions from the Munitions Area Recruiting Office, but the call was suspended until March 31st for a substitute to be trained. The T.C. has the right to appeal again.

At Hastings, exemption was applied for by R. Merrifield (40, Class A), electrical fitter, for 15 years with Mr. Wordley, and three months were conceded.

At Hastings, the Tramway Co. appealed for a motorman (33, C.2), and by assent on the part of the Military he was exempted for three months.

At Eastbourne, appeals were made for three men engaged at the Corporation electricity works. They had been put back for substitution, and the engineer (Mr. J. K. Brydges) said that only one man had been sent as a substitute, and after looking at the work required to be done he said that

he was not able to do it. Mr. Brydges added that since the previous appeal the difficulties at the works had increased. The cases were adjourned *sine die* for substitution.

Exemption was claimed at Kirkby Lonsdale for the man in charge of the electric light plant on the Underley Estate. He is a B.I. and was discharged from the Army on medical grounds in 1915. He was exempted until February 1st, with leave to appeal again.

Wrexham Rural Tribunal has given temporary exemption until February 12th to W. Williams (28, C2), electrician, Coedpoeth, engaged in the business of his father.

Reading Tribunal has refused exemption to J. H. Grubb (C3), electrician at the Palace Theatre, but suspended the calling-up until December 12th.

The Cumberland Appeal Court heard a military appeal against R. Boyle (31), a cable jointer in the electricity department of the Carlisle Corporation. Mr. Purse stated that the man was passed in Class A when the Medical Board were, a short time ago, passing the halt, the lame, and the blind. In his department he had lost 50 per cent. of his original staff, and he had instructions from the Electricity Committee to give every facility to men to join, but, in the national interests, he did not think that this man should be taken. He was in the Volunteers, and on his first parade he fell out and had a fit. At the outbreak of war Boyle was in the Army, and was discharged three months afterwards. A fresh medical examination was ordered.

At Southwark, Mr. W. H. Donovan, director of the London Commercial Electric Stores, Ltd., 36, fit for sedentary work at home (C3), again appeared to show cause why his certificate of conditional exemption should not be withdrawn. The case was adjourned a month ago in order that he might conform with the condition laid down that he should join either the V.T.C. or the Special Police. Appellant reported that he had since joined the V.T.C. at Croydon, where two nights a week he was engaged on clerical work. He was granted six months' exemption on condition that he registered at the Labour Exchange within seven days for work of national importance.

BUSINESS NOTES.

Tungsten Importation Licences.—Answering a question in the House of Commons recently as to why licences were granted to certain British electric lamp makers for the importation of tungsten wire for electric lamps, when the import of this commodity has been nominally forbidden, and supplies can readily be obtained in this country from British manufacturers at competitive prices, the President of the Board of Trade said that licences had not been given for several months.—*The Engineer*.

Electrical Exhibition at Tokio.—An Exhibition of Electrical Machinery and Appliances will be opened at Tokio on March 20th, 1918, under the auspices of the Nippon Denki Kyokwai (Japanese Electric Association). The manufacture of electrical machinery and appliances in Japan has, as our readers are aware, undergone great development during recent years, and the object of this Exhibition is to show the progress that has taken place, and to give a stimulus to further enterprises. The *Board of Trade Journal* states that the exhibits will include motors, generators, batteries, and generating plant equipment; electric railway materials; telegraph, telephone and wireless telegraph apparatus; electric lighting apparatus and accessories; appliances for the electrochemical industry; domestic electrical appliances; industrial electrical machinery, pumps, cranes, &c.; surgical, educational and experimental electrical apparatus; and general accessories. Only Japanese manufactures will be shown.

France.—La Compagnie des Forges et Acieries Electriques Paul Girod is the name of a new company which has lately been formed in Paris, with a capital of £600,000, to acquire and carry on work at Ugine (Savoie).

British Trade with Brazil.—There has been issued by British Chamber of Commerce in Brazil (143, Rua da Quitanda, Rio de Janeiro) a booklet giving valuable hints for manufacturers and exporters concerning possible improvement of British trade with Brazil. The material has been compiled by the Secretary, Mr. Arthur Abbott, from the reports of various Sub-Committees and other reliable sources. Mr. Abbott will be pleased to answer inquiries on special points which interested parties in this country may desire to put to him. It is shown that our enemies attained a firm hold on the commerce of Brazil, in great part through their having adopted the metric system years ago in Europe, and the hope is expressed that when England has done the same British trade may be able to recover lost ground, and to hold its own after the war. It is held, however, that any proposal that it should be unlawful for a British merchant to sell goods excepting in terms of the metric system would be most prejudicial to British commerce in Brazil. A Rio representative's opinion is quoted to show that technical representation pays well.

British manufacturers are urged to remember the importance of having spare parts for all types of machines available in the country. A large Swiss manufacturing house has opened an important establishment with a large stock of plant and accessories, and with a competent technical staff. British manufacturers must do likewise or lose business. Representatives sent out must have

a good knowledge of the Portuguese language, *not* Spanish; Portuguese is being taught in the States, with a view to capturing Brazilian trade. There is an opening for British retail stores, packing must receive greater attention, and criticism is offered respecting English catalogues. In the last connection different illustrations should be given of the same machine, parts of machinery should be numbered for greater clearness, illustrations should be given of large work carried out, there should be a Portuguese-English and English-Portuguese index, and details of spare parts, also prices of machines and parts, must be given. Owing to fluctuation in exchange, prices should be quoted in sterling. Customs tariffs should be carefully studied. There should be better facilities for granting credit. Travelling representatives must be of the right type, and must be able to speak Portuguese fluently.

In a selection of notes relating to particular classes of imports, several electrical lines are referred to:—

"Electric Switches and Other Fittings.—A great deal of very cheap and inferior stuff used to come from Germany, but the business has gradually been getting into the hands of American makers. British goods are almost unknown, although there appears to be no reason why, with a careful study of market requirements, British makers should not be able to compete. It would be hopeless, however, to attempt to sell standard British goods here, as they are quite unsuitable.

"Electric Lamps.—Formerly imported from Germany, Austria, and U.S.A., now entirely in American hands. Imports from Great Britain nil. The business in this, as in all electrical material, is enormous and well worthy of attention. The German (Osram) lamp was predominant in the market.

"Electric Lighting Fittings.—The greater part of these goods used to come from Germany, and a little from England and the U.S.A. The general styles are cheap and light in weight, but gaudy in appearance.

"Electric Generators, Motors, Dynamos, &c.—Germany and the U.S.A. are able to sell at prices that practically prevent England from supplying anything but the requirements of British companies working here, or a few favoured orders. This is a most important matter, as Brazil is specially favoured, owing to its immense water power, in respect to the development of electrical energy. Germany and the United States of America have been able to do this on account of their business being handled by very large and wealthy manufacturing concerns, quite capable of undertaking themselves the largest contracts and of financing them where convenient and advisable.

"Water Turbines.—As water power exists almost everywhere throughout Brazil, there is always business in view. Swiss, German, and American turbines are chiefly imported, on the grounds that they are better designed.

"Electric Wires and Cables.—This business used to be in the hands of German, American, and Italian makers. German goods were distinctly inferior in quality, but exceedingly cheap, and the same might be said of the Italian. American manufacturers have done a large business for years in all grades of wires and cables, and at present have it all to themselves. British goods have been conspicuous by their absence, although the country offers a vast field for them. A point to note is that the thicknesses should always be given in millimetres or Browne and Sharpe Gauge."

We believe that it will shortly be possible for copies of the pamphlet to be obtainable in this country from the Association of Chambers of Commerce of the United Kingdom, Parliament Mansions, Victoria Street, S.W. British manufacturers interested in the Brazilian market would find it well worth while to secure a copy.

Diary.—MESSRS. JENSON & NICHOLSON, LTD., Goswell Works, Stratford, London, E. 15.—We have received a handy (Letts') diary and notebook for 1918. There is a great deal of useful information of a general kind, also some of a particular kind respecting the firm's special insulating varnishes, &c.

December Moonlight.—MESSRS. C. A. VANDERVELL AND CO., LTD., are issuing Moon Chart Cards for the month of December, and will be happy to send one to those who write in to Acton. The card is compiled, as before, by Mr. A. Midgley, the chief engineer to the firm.

Plant for Sale.—Bedford Corporation Electricity Department has for disposal two high-speed enclosed compound self-lubricating engines, direct-coupled to one-phase alternator, 2,100 volts, 60 cycles. For particulars, see our advertising pages to-day.

Catalogues and Lists.—ENTERPRISE MANUFACTURING CO., LTD., Gun Street Electrical Works, London, E. 1.—Leaflet illustrating their "E. M. C." ship electric fans.

DUNCAN ELECTRICAL CO., LTD., 1,665, St. James Street, Montreal.—Twenty-page illustrated price list of Edison sockets, cut-outs, tumbler switches, and other specialties; also an export price list of some of the same manufactures in foreign languages, and a number of other leaflets. The company is paying special attention to export markets.

Book Notice.—MESSRS. H. DUNOD & E. PINAT, of Paris, have sent us their catalogues of books dealing with scientific and engineering subjects, of which, as is well known, they have long made a speciality.

Dissolutions and Liquidations.—KINGSTON & CO., LTD., Margate.—A meeting of creditors is called for Monday, December 3rd. Liquidator: Mr. J. W. Scarlett.

MICA MANUFACTURING CO., London, N.—With reference to the notice published, last week, this partnership has only been dissolved so far as Mr. Whiffen is concerned. The other partners are carrying on the business as usual.

LIGHTING AND POWER NOTES.

Accrington.—REPORT OF SPECIAL COMMITTEE.—The Special Committee appointed by the T.C. to inquire into the working of the electricity department has presented its report. A tabulated statement shows that the capital expended rose from £68,858 in 1907-8 to £172,062 last year. The first seven years yielded a profit of from £604 to £2,701 (1910-11), but in 1913-14 the profit fell to £677, and subsequent losses were £3,073 in 1914-15, £2,792 in the following year, and £9,507 last year. The report deals with the disturbing elements experienced in war time, including the Government restrictions upon several large power users, the continuous serious advance in wages, increased cost of materials, higher interest, &c. Wages have increased 18 per cent. in two years, with reduced sales of 6 per cent. Charges have been increased on two occasions during the current financial year. The Committee reports that as to the future nothing can be advanced that is not of a speculative character, but the first consideration is that no additional capital expenditure must be incurred which will not, so far as the present quantum of production is concerned, effect greater economies than the added expenses.

Australia.—The Victorian Government has decided to ask Parliament for authority to supply electric power from Newport power house. Owing to the difficulty of obtaining equipment for the electrifying of the suburban railways, the power house is ahead of the rest of the scheme, and will be in a position by March or April next to supply electric power in bulk. The power available will be considerably in excess of railway requirements for some time to come, and as the other suppliers of power to the public in Melbourne are reaching the limit of the capacity of their equipment, it is proposed to sell them power from Newport. Following the Cabinet meeting, the Minister of Railways said he would introduce the necessary Bill into Parliament almost immediately.

VICTORIAN BROWN COAL.—According to the Australian papers, the Premier of Victoria (Sir Alex. Peacock) has received the report of the Committee of Experts on the proposals to develop the brown coal deposits at Morwell. The Committee reporting in its favour, recommends that an electrical generating station and transmission scheme be established, with a power house at Morwell, that the management (both technical and commercial) be in the hands of an engineer-manager, who shall devote his whole time thereto, and be responsible to a board of three salaried directors to be appointed by the Government, and that the authority board proposed should as early as possible ascertain the prospect of establishing in the States new industries that require large quantities of cheap electrical energy—such as those treating zinc concentrates and manufacturing calcium carbide, alkalies nitrates, &c. The Minister for Mines considers that authority should be given for the preliminary work suggested by the Committee.

The report considers the probable demands for power, amongst which it is believed that the zinc industry alone may absorb 100,000–150,000 H.P. ultimately. Without allowing anything for railways or new industries which may be established, it is estimated that the Melbourne requirements in 1921 will amount to 163 million units, with a maximum demand of 46,580 kW., and in 1925 to 311 million units, with a maximum demand of 97,500 kW. The City Council will require a supply in two years' time, and the Supply Co. shortly after: the situation calls for a plant of 100,000-kw. ultimate capacity, and the Morwell site provides natural condensing water for the first 50,000 kW.

The estimated total annual cost, including annual charges, of supplying to Melbourne 50,000 kW. at a 43 per cent. load factor, from Morwell, is £210,191, or 26½d. per unit, as against 339d. per unit, if the coal were transported. The former figure is less than that of any of the alternative proposals. The estimates based on an initial capacity of 50,000 kW., with a power house designed for an ultimate 100,000 kW., show an expenditure of £1,262,500, including £261,120 for the 82-mile transmission line. Additional expenditure would be incurred on the terminal station at Richmond and in connecting it to the city supply, &c., and the total expenditure would be £1,555,673. It is estimated that energy could be sold to existing undertakings at 326d. per unit, which compares with the City Council's cost per unit sent out in 1916 of 199d., excluding capital charges on its power house. The Committee recommends that whether or not the State undertakes the generation and distribution in bulk of electricity, it should control and direct the co-ordination of all the State and statutory supply undertakings in Victoria.

Batley.—PRICE INCREASE.—The Electricity Committee has decided to increase the charge for electrical energy for power and heating (not for lighting) by another 10 per cent., making a total increase over pre-war rates of 27½ per cent.

Blackburn.—PRICE INCREASE.—The Electricity Committee recommends that, as from January 1st, the charge for current shall be advanced by 10 per cent., making a total increase of 25 per cent. during the war.

Bristol.—STREET LIGHTING.—The recommendations of the Sanitary Committee re street lighting (see *ELEC. REV.*, page 444, November 9th) were not adopted by the Council: the Committee was instructed "not to alter the lighting of the incandescent street lamps in any manner that will necessitate the whole of the incandescent lighting of the city, domestic and public, being cut off on receipt of air raid warning." The resolution prevented the Committee carrying out its recommendation. On Thursday, November 22nd, the Committee reported that, at a conference with

the Chief Constable and the city electrical engineer, it was stated that there are 698 arcs and half-watt lamps, all being now in use. There are 1,573 electric incandescent lamps, and 629 have been in use throughout the war and 944 not in use. If brought into use the latter could not be extinguished instantaneously without, at the same time, cutting off all other incandescent lighting. This also applied to the 629 lamps in use. The Chief Constable and the city engineer are agreed that, in the event of a raid, these lamps were to be extinguished instantaneously, and that would involve the extinction at the same time of all incandescent electric lighting in private and public buildings. The Chief Constable recommends that all the incandescent electric lamps should be brought into use, in spite of the fact that this will necessitate the extinction of incandescent electric lighting in public and private buildings. The hospitals in Bristol had arranged for alternative lighting, and the same provision should be made in other public buildings. In houses candles should be available. It has been arranged that the power supplies will first be cut off and then the lighting. The two alternatives before the Council were (1) to exclude the whole of the incandescent electric lighting and to use the electric arc and half-watt lamps; (2) to include the whole of the incandescent as well as the half-watt lamps, accepting, at the same time, the liability for the extinction of all incandescent lighting in case of a raid. If the Committee was in favour of the second alternative it would be necessary to make a report to the Council, recommending the rescinding of the resolution of November 9th. After an animated discussion, the recommendations of the report were approved by 10 votes to 5, the Committee recommending the adoption of the second alternative stated in the report.

Clayton.—E.L. PROPOSALS.—Whilst the Electrical Distribution of Yorkshire, Ltd., has given notice of intention to renew its application for power to supply Clayton and Queensbury with electricity for power and lighting, the position at Clayton is becoming complicated. Queensbury has consented to the company's application: the Clayton District Council, last year, decided to support the company, but a ratepayers' meeting demanded that the decision be rescinded, and that Bradford Corporation be asked for terms. The Council has recently had to consider the matter again on the raising of the new application, and has approached the Bradford Corporation, who last week appointed a Sub-Committee to negotiate with Clayton Council.

Continental.—SPAIN.—La Sociedad Anonima Productora de Fuerzas Motrices is the style of a company formed at Bilbao, with a capital of 6,400,000 pesetas and the following objects:—The acquisition and utilisation of waterfalls; manufacture and sale of materials for the electrical industries; acquisition and working of coal fields, metal-bearing deposits, production of lime, cement, &c. The company already owns a fall on the Flamisell River, where the installation under construction will be completed by the end of 1919.

ITALY.—The recently amalgamated concerns, La Dinamo-Società Italiana per Imprese Elettriche and the Anza Società, Milan, have begun the construction of a new central station at Iselle, and are also improving the plant which is to serve for the piercing of the Sempione Tunnel.

An increase in plant is being carried out by the Unione Esercizi Elettrici, Milan.

As a result of the union of the Forni Elettrici and the Elettro-carbonium concerns, extensions have been taken in hand, which are expected to enable the joint companies to turn out 1,000 tons of electrodes per month, or other products of like kind.

Dublin.—An interesting display of electric lighting for country houses was a feature at a farm-tractor exhibition held recently.

Edinburgh.—At a meeting of the annual Commission of the Convention of Royal Burghs, last week, Councillor Stevenson (Edinburgh) reported on the proceedings of the B. of T. Electric Power Supply Committee. In giving evidence before the Committee, Mr. Stevenson said there would be a marked difference of opinion when it was sought to unite private and municipal enterprises, or alternatively to eliminate one at the expense of the other. He stated his strong preference for municipal control on the ground that electricity was gradually becoming more and more a public necessity, and it was not in the public interest that it should be in the hands of private companies, even if they were limited to a sliding scale of dividend. A combination of all companies and local authorities in each industrial district was quite impracticable, while any attempt to put all the electrical undertakings under a power company would create such local opposition that success along these lines could not be attained.

Ex-Provost Keith (Hamilton), the chairman, did not think any one of them would like to see the electrical power of either the country or of separate communities placed in the hands of any large company. The position taken up by Councillor Stevenson was one they cordially homologated.

Gainsborough.—E.L. PROPOSAL.—The Urban Council some years ago obtained a prov. order to supply electricity within its area, and has twice been granted an extension of time. Mr. Jas. Marshall, of Marshall, Sons & Co., engineers, now announces that he is about to apply to the B. of T. for a prov. order authorising him to supply energy to the town. Messrs. Marshall have already in course of erection on the Trent a large power station, which is rapidly approaching completion; it would be a comparatively easy matter to enlarge this station to almost any extent.—*Yorkshire Post*.

Greenock.—**LOAN SANCTION.**—The Scottish Office has sanctioned the borrowing of £53,000 for the extension of the Corporation electricity undertaking, which raises the total sum borrowed in this connection to £465,000.

India.—According to *Indian Engineering*, a licence has been granted for electric supply at Mhow cantonment; the system is to be D.C., at 230 and 460 volts, and the municipality with take energy for 312 street lamps during the period of the licence.

Kinlochleven.—Among the applications for provisional orders of which public notice is being given, is one on behalf of the British Aluminium Co., Ltd. The promoters propose to extend the operations of their factories at Kinlochleven, Lochaber, by impounding the waters of Loch Laggan and Loch Troig and of the River Spean and other lochs and streams connected with these, for the purpose of providing additional water power. The scheme entails the acquisition of land in the district and the deviation of public roads and of a portion of the West Highland Railway, as well as a great amount of constructive work.

Leicester.—**NEW POWER STATION.**—The T.C. has decided to apply for a provisional order to acquire land and erect a generating station, at an estimated cost of £285,000.

London.—**ST. PANCRAS.**—The Electricity Committee reports that great difficulty is experienced in obtaining the necessary deliveries of coal; the undertaking is consuming about 150 tons per week in excess of the contract deliveries, and, as a consequence, the reserve stocks are being seriously depleted. The 2,000-kw. turbine set at the King's Road station recently broke down. This machine had been running continuously for nearly three years, but, owing to existing conditions, it had been found impossible to overhaul it during that time. The spare parts are in hand for replacement, but, owing to existing scarcity of labour, three weeks will be required for the necessary repairs to be completed. In the meantime, arrangements have been made to obtain assistance from the L.C.C. Large consumers of current have reduced their load during the maximum load period, and these arrangements have relieved the undertaking in the serious position in which it was placed. It is proposed that the connection with the L.C.C. sub-station should, so far as practicable, be made permanent, so as to be of mutual assistance should occasion arise.

HACKNEY.—An application is to be made to the L.C.C. for sanction to borrow £28,000 for an extension of the steam-raising plant at the generating station. The estimated cost of a 66,000 lb. per hour steam-raising plant is put as follows:—Two boilers, £12,150; two economisers, £2,250; two sets flues, fans, motors, chimneys, £4,080; two brickwork settings, £2,250; one pump pit (provisional), £290; lagging, galleries, £750; Insurance Co.'s inspection (provisional), £75; travelling hopper, £495; cutting away roof (provisional), £150; two feed pumps, £985; pipework, lagging, &c., £2,450; contingencies, awards to labour, &c., £1,575; total, £27,500. The borough electrical engineer has been instructed to obtain an estimate from Messrs. Babcock & Wilcox, Ltd., for the plant required.

Morocco.—An electric station has been opened at Tangiers by the Compania Transatlantica Espanola. The scheme contemplates the installation of eight generating sets, of which one only is at present in working, of 200-H.P. capacity, driven by a Sulzer-Diesel motor fired by creosote. The firm of Bastos Bertran Hermanos y Ca. supplied the plans and plant and carried out the installation.

Mytholmroyd.—**PROV. ORDER.**—The U.D.C. has had under consideration the terms on which the Halifax Corporation was prepared to supply electricity, subject to the granting of a prov. order, and those of the Electrical Distribution of Yorkshire, Ltd. At a further meeting it was decided to seal the agreement with the Halifax Corporation.

Nelson.—**PRICE INCREASE.**—The Electricity Committee has decided to increase the price of electricity by ½d. per unit for lighting and ¼d. per unit for power.

New Zealand.—In answer to questions in the House of Representatives, relative to the proposal by Mr. Orchiston to extract nitrogen from the air by means of electric power developed at Milford Sound, for which project it was stated that a company had been formed, the Hon. W. McDonald intimated that the matter would be submitted to the Cabinet for consideration, while the Hon. W. Fraser, Minister of Public Works, said the application had been considered by him, and rejected by the Cabinet (apparently under the Dominion Act retaining water-power development, generally, for the Government). He added that the application was made with a view to acquiring and selling the rights to an American company, and that he hoped the House would not ask the Government to part with the valuable power, which might be used for other purposes (the treatment of the local refractory ores) than the extraction of nitrates. It was stated in discussion that the power available would produce £100,000 worth of nitrate products per annum.

The Wellington City Council has decided to raise the price of electricity supplied by the tramways power house by ½d. per unit for power purposes only. This is the first increase in charges for municipal service since the war began.

The Auckland City electrical engineer reports that, owing to the shortage of cable, it will be necessary to refuse future connections in the central city area.

Rawtenstall.—**PRICE INCREASE.**—The T.C. has decided to increase charges for electricity from January next as follow:—Lighting by 15 per cent., making 25 per cent. on pre-war rates; heating 15 per cent., making 30 per cent.; power 18½ per cent., making 33½ per cent. to consumers using up to 250 units per H.P. per quarter, and over 250 units the removal of the present advance of 15 per cent., and the substitution of the standard coal clause.

Rotherham.—**PRICE INCREASE.**—The Corporation has given notice that the charges for electrical energy for power and heat purposes have been increased by 20 per cent., and that such increased charges will apply to the quarter ending December, 1917, and afterwards until further notice.

Shipley.—**PRICE INCREASE.**—The District Council has decided to increase the flat rate for power from 1½d. to 2d. per unit, with an advance of 25 per cent. on the sliding scale for power users, making 50 per cent. on pre-war charges; the price for lighting purposes will be advanced from 1½d. to 5d. per unit, the increase to take effect from January 1st, 1918.

Sligo.—**WORKHOUSE LIGHTING.**—At a meeting of the Board of Guardians it was suggested that electric light should be installed in the workhouse. Ald. Jinks remarking that a similar proposal at Sligo Asylum had led to a guarantee that a saving of 50 per cent. would be effected.

South Africa.—The T.C. is faced with a shortage of electric cable and tramway cars. In December representations were made in England in regard to the need for turbine and boiler plant and various electrical machinery. Some of this plant has been obtained, but the many new local industries render the need for additional turbine plant greater than before. As regards the tramways, it was intended to purchase 11 additional cars in 1914, but the matter was deferred, and at present about 4,000,000 additional passengers per year are being carried. At present about 134 cars are in commission, while 150 could be usefully employed.

Stirling.—**PRICE INCREASE.**—The price of electricity for lighting purposes has been increased by ½d. per unit.

Swansea.—**PLANT EXTENSION.**—At the meeting of the Corporation, last week, the Electricity Committee reported on the agreement arrived at with the Swansea Harbour Trust for increased supplies of electricity, which would necessitate the extension of the Trust's power station at the docks. The agreement is to come into force not later than June 30th next, the Corporation to supply up to 500 K.V.A. and to make arrangements to increase the same to 1,000 K.V.A.; the price to be paid by the Trustees will be £2 per kw. per annum, plus 585d. per unit, subject to a coal clause, the Trustees to pay a minimum of £2,000 per annum, but until the Corporation is in a position to supply up to 1,000 K.V.A., the minimum to be £1,500 a year. The agreement is to be for seven years, with the option of an extension for another seven years. The Committee, in view of the urgency of the matter, recommended that tenders be obtained for the plant, and that application be made to the L.G.B. for sanction to the borrowing of £39,000. The chairman, in moving the adoption of the report, said he hoped that in the near future the whole of the smaller stations in the neighbourhood would be linked up with the Corporation supply. The matter was referred to a special meeting of the Council, and authority was given to invite tenders.

Tasmania.—The Public Works Committee has been hearing expert evidence on the proposal to spend £10,000 on the projected hydro-electric scheme on the King River to supply the Mount Lyell Co. with 25,000 electric H.P. The money will be devoted to driving a tunnel through which the King River will be diverted, in order to permit of the examination of the river's bottom preliminary to laying down the foundations of a permanent dam. The complete scheme will, it is estimated, absorb £840,000, and take three years to install. The dam will be a curved concrete structure with a height of about 180 ft. above the river bed. The storage area will be approximately 8 sq. miles. The catchment supplying water to the King River above the dam is about 200 sq. miles, and it is estimated that there will be a yield of 45,000 H.P. at the generators. This, it is confidently anticipated, will usher in a new industrial era on the west coast of Tasmania, making possible the commercial handling of low-grade ores which could not otherwise be looked at.

It is not intended to await the completion of the scheme before launching out in new enterprises. The Mount Lyell Co. is increasing the power plant at its own station at Lake Margaret, with a view of transmitting to Zeehan sufficient power to work the first units of the treatment plant for the electrolytic production of zinc from the Mount Read-Rosebery group of mines.—*Melbourne Age*.

The Report of the above Committee has been submitted to the Tasmanian House of Assembly. It states that the Government will be shortly in full legal ownership of the Zeehan smelters, over which it has a mortgage of £20,000, advanced some years back to keep the works going. It is probable that the residues from the electrolytic treatment works, to be erected at Zeehan, will be sufficient to keep the lead smelting furnace in operation. This should result in the reopening of low-grade ore mines which were closed owing to lack of smelting facilities. The estimated cost per horsepower for the King's River scheme compares favourably with that at Great Lake, and should be considerably less than at Lake Margaret.—*Sydney Telegraph*.

Willesden.—The Electricity Committee reports having had under consideration correspondence with reference to the supply of electrical energy in bulk by the North Metropolitan Electric Power Supply Co. after March 31st, 1918. A further report will be presented in due course. Arising out of instructions to carry out certain extensions, application is to be made to the L.G.B. for permission to raise a sum of £2,900. An offer has been received to purchase land belonging to the Council in Denzil Road originally acquired by the authority as a site for a generating station. If this land is disposed of, it will be necessary to extend a high-tension cable to a factory to be erected, and to provide a transformer, at an estimated cost of £900. Application is to be made to the L.G.B. for sanction to the borrowing of this amount.

Wimbledon.—**YEAR'S WORKING.**—The report of the year's working of the Corporation electricity undertaking to March 31st last shows a total revenue of £11,988, expenditure amounting to £27,586, and a gross profit of £14,101. Interest and sinking fund charges amounted to £18,622, leaving a deficit on the year's working of £4,221. During the year 3,712,749 units were sold, a decrease of 68,995 units; the total average price obtained per unit sold was 2'647d., and the total average all-in cost per unit sold was 2'987d.

Windsor.—**PRICE REVISION.**—The Electrical Installation Co., Ltd., has asked the T.C. to assent to the charges for current being increased by 1d. per unit, and the matter has been referred to the Lighting Committee for consideration.

TRAMWAY AND RAILWAY NOTES.

Barrow-in-Furness.—A remarkable accident occurred on the tramways last week. A ten-year-old girl was standing on the top of a car, when the trolley rope swung round and caught her in the neck, lifting her bodily off the car and dropping her in the roadway. She received cuts and bruises.

Blackpool.—The Corporation is making application for a provisional order to carry out street improvements in various parts of the borough which will allow of better tramway facilities.

TRAFFIC FIGURES.—The receipts on the Corporation tramways for the past month were £5,736, or £1,766 more than last year, the increase being largely due to the transfer of the Squire's Gate line to the Corporation. The total receipts from April 1st to November 15th were £89,761, an increase of £11,333 on last year, and the receipts per car-mile were 2s. 1½d., an increase of 2d.

Bradford.—**WAGES DISPUTE.**—Six hundred of the tramway employes met, on Saturday midnight, to consider the Corporation War Wages Committee's recommendations in regard to wages, declining to grant the employes' application for an advance of £1 per week on pre-war rates, the same to be merged into wages instead of war bonus, double time for Sundays and Bank Holidays, and equal pay for men and women on the same class of work; but recommending that a further 3s. per week bonus be given to men and 2s. to women. The meeting unanimously rejected the offer, and decided that if the City Council adopts the War Wages Committee's recommendation, 21 days' notice that a dispute is pending be given to the Committee on Production.

Burnley.—**STRIKE.**—Last week a strike of skilled engineers in the district took place regarding the interpretation of the recent award of 12½ per cent. wages advance by the Ministry of Munitions. The departments particularly affected were the gas, tramways and electricity, the men concerned being mostly engineers and fitters, who contended that they came within the scope of the award. On their behalf, it was submitted that the skilled men engaged on commercial work and priority work were on work of national importance, and that they were entitled to the advance along with those on munition work to whom it had been granted. Steps were taken to advise the public that in consequence of the strike it might be necessary to reduce the tramway service, and Mr. H. Mozley, the tramway manager, was authorised by the Tramways Committee to offer the men concerned the 12½ per cent. advance at once, on the understanding that if the Ministry of Munitions decided that they were not entitled to the advance, the extra payment should be remitted. The men accepted this offer.

Bury.—The Corporation Tramways Committee has declined the request for a suspension of traffic on Christmas Day. The Preston Corporation Tramways Committee recommends a limited service from 2.30 p.m.

Continental.—**SPAIN.**—Plans are being prepared in respect of a projected electric railway between Calahorra and Arne-lillo, a distance of about 37 km.

Application has been made for a concession for the establishment of an electric tramway in the city of Brzgos. The promoter is Don Luis Gallardo. A similar concession has been applied for by the Compañia Tranvias Electricos de Vigo, being an extension of its network from Los Canos to Fausto de Chapela.

Croydon.—The T.C. has adopted a recommendation of the Tramways Committee that the attention of the B. of T. be drawn to the inadequate representation of municipalities on the new expert Committee for dealing with tramway labour and material; also that the terms of reference should include consideration of the control of motor-omnibuses.

Leeds.—During a violent gale which swept West Yorkshire, last week-end, a car from Leeds to Bradford jumped the metals at Bramley, was caught by a strong gust of wind, and swerved across the footpath, knocking down a telegraph pole and colliding with a wall. Some little damage was done to the car, but there was no personal injury amongst the passengers.

London.—**GOVERNMENT TRAMWAY CONTROL.**—The L.C.C., in authorising Mr. A. L. C. Fell, the chief officer of the tramways, to serve on the expert Committee appointed by the B. of T., adopted the recommendation of the General Purposes Committee that the Committee should be constituted on a basis securing representation of the municipal and private interests concerned proportionate to their magnitude, and that it is important that it be entirely free from association with any traffic undertakings likely to be effected, and therefore the appointment of an interested party as chairman is unfortunate.

HAMSTEAD.—**ELECTRIC VEHICLES.**—The B.C. has recently acquired a couple of electric motor vehicles fitted with Edison batteries for the use of the Medical Officer of Health's department. The chassis are being fitted with special van bodies for the collection and delivery of infected bedding.

Manchester.—**FARE REVISION.**—The Corporation Tramways Committee, instead of increasing fares, has decided to shorten the stages by reverting to the scale in operation prior to the last revision in January, 1913. The 1d. stage will be reduced by about 629 yards, and other distances in proportion. The age for children's half-fares will be reduced from 16 years to 14 years. It is proposed that the revision shall be in force for six months. If the City Council approves, the revision will come into force immediately.

TRAMWAYS FEDERATION.—At a Conference, on Friday, of representatives of Lancashire and Cheshire tramways undertakings, it was decided to form a Lancashire and Cheshire Tramways Federation, to be composed of two representatives and the manager of each concern. A resolution was passed declaring the advisability of establishing an Industrial Committee, representative of authorities and employes, on the lines of the Whitley Report.

Notwithstanding the decision of the Tramways Committee that cars shall run as usual on Christmas Day, the ballot of the employes shows an overwhelming majority in favour of a stoppage, 1,902 voting in favour and only 23 against.

TELEGRAPH AND TELEPHONE NOTES.

A Wireless Telegraph School for Ireland.—The Technical Education Committee of Dublin, under the guidance of Mr. W. J. Lyons, a Dublin expert in wireless work, has completed arrangements for opening a School of Wireless Telegraphy for the whole of Ireland. A generous free admission scholarship scheme is offered by the Marconi Co., which has given very strong encouragement and support to the Committee in this new development of its technical schools.—*Irish Times*.

Australia.—The Postmaster-General has stated that it is intended to install automatic telephone exchanges in Sydney and Malvern, Victoria. The Sydney exchange is estimated to cost about £90,000 and the Malvern exchange about £56,000.

At a lecture in Melbourne, Commander Creswell, of the Australian Navy, stated that wireless messages sent out from Germany were being daily intercepted by the wireless stations at Perth and Sydney.—*Melbourne Age*.

Long-Distance Wireless.—The United States Government has opened a radio-telegraph station at Hawaii, Honolulu, and messages have been exchanged over 5,000 miles. For some time Hawaii has been in touch with Yokohama, Japan. The United States outpost station will now be able to send messages to the Australian station at Sydney; but, owing to its comparatively low power, the latter cannot reply to Hawaii.

New Zealand.—The annual report of the Post and Telegraph Department states that improved methods of detecting wireless signals were introduced at Awarua, Wellington, and Auckland a few months ago, and apparatus for the other stations will shortly be brought into use. The results obtained at Awarua, where the apparatus has been extensively experimented with, have been particularly gratifying. Signals of readable strength have come in from American, Asiatic, and European stations. The use of this detecting apparatus with a particular combination of receiving circuits has demonstrated that daylight signals from stations using the ordinary wave-lengths can be rendered plainly audible, which by the ordinary methods and the use of the crystal detector could not be heard. Time signals have been transmitted from the Observatory clock, Wellington, to Tahiti, the distance covered being 2,215 nautical miles. The laying of an extra cable connecting the North and South Islands has been completed by the Eastern Extension Cable Co.

Russia.—An All-Russian Radio-Telegraphic Congress is to be inaugurated at Petrograd on December 9th.

Storm Damage.—On Saturday last the metropolis was swept by a hurricane, which continued for several hours with great violence. Similar stormy weather was experienced in most parts of the country. The gale caused very little interruption to telegraphic and telephonic communication within the metro-

polis, although lines in the country were damaged. In the Rotherham district a fierce gale of wind and rain attained a velocity of 60 miles an hour. Telegraph and telephone wires were broken in all directions, causing a dislocation of business. —*Daily Telegraph*.

CONTRACTS OPEN AND CLOSED

OPEN.

Ashton-under-Lyne.—December 5th. Engine slack for Electricity Committee. Borough Electrical Engineer, Wellington Road.

Australia.—PERTH.—December 5th and 12th. Postmaster General's Department. Telegraph and telephone instruments and parts, battery material and telephone switchboards, parts, &c. See "Official Notices," November 16th.

ADELAIDE. December 12th. P.M.G.'s Department. Telephone material. Schedules 478 to 482. See "Official Notices" November 23rd.

SYDNEY.—In the near future the Deputy Postmaster-General will be inviting tenders for certain telephone and switchboard parts. Some particulars can be consulted at the Department of Commercial Intelligence, 73, Basinghall Street, London, E.C. 2.

Carlisle.—December 4th. Electricity Department. "One 1500/2000-KW. turbo-alternator and one surface condensing plant. See "Official Notices," November 16th.

Leeds.—December 4th. Electricity Department. 6,000-KW. turbo-alternator and condensing plant. See "Official Notices" to-day.

London.—H.M. Office of Works. December 6th. Twelve months' supply of electric wire and cable; three months' supply of electric bell fittings. See "Official Notices" to-day.

Manchester.—December 12th. Three fan draught cooling towers at the Stuart Street station, for the Electricity Committee. See "Official Notices," November 16th.

Rosario.—February 23rd, 1918. Municipality. Establishment of telephone service within the municipal radius. Conditions on application.

CLOSED.

Bury (Lancs.)—B.G. Electric motor for hot water supply: Veritys, Ltd.

Glasgow.—Recommended tenders:—

Electricity Department.—Bruce Peebles & Co., Ltd., two 500-KW. rotary converters for consumers' premises, at £2,200 each, plus £45 for spares. British Thomson-Houston Co., Ltd., three 1,930-KW. rotary converters for the generating stations, at £4,768 each.

Tramways.—Cable. Liverpool Electric Cable Co., Ltd.; General Electric Cable Co., Ltd.

Trolley cord.—Joseph Cookson, Ltd.

Rotary converter.—British Westinghouse & Co., Ltd.

Galvanised steel wire.—Whitcross Co., Ltd.

Cleansing Department.—Electrical material.—Woodward & Co.

Grimsby.—Town Council. Accepted tender: Crompton and Co., Ltd., at £152, motor-generator and switchgear for charging electric vehicle batteries.

FORTHCOMING EVENTS.

Junior Institution of Engineers.—Friday, November 30th. At 8 p.m. At 31, Victoria Street, S.W. Paper on "Drawing Office in Relation to other Departments," by Mr. E. D. Roberts.

Institution of Municipal and County Engineers. Friday, November 30th. At 5 p.m. At Burlington House, Piccadilly, W. Discussion on the "Supply of Power or Fuel to Vehicles on Public Highways."

Institution of Mechanical Engineers.—Friday, November 30th. At 6 p.m. At the Institution of Civil Engineers, Great George Street, S.W. The Thomas Hawksley "Lecture on Heat Engines," by Capt. H. Riall Sankey, C.B., R.E.

Salford Technical and Engineering Association.—Saturday, December 1st. Visit Manchester Corporation Hydraulic Pumping Station, At 7 p.m. At the Royal Institute. Annual Meeting.

London Association of Foremen Engineers.—December 1st. At 7 p.m. At Cannon Street Hotel. Annual meeting.

Royal Institution of Great Britain.—Monday, December 3rd. At 5 p.m. At Albemarle Street, Piccadilly, W. 1. General monthly meeting.

Royal Society of Arts. Monday, December 3rd. At 4.30 p.m. At John Street, Adelphi, W.C. Cantor Lecture, by Prof. H. C. H. Carpenter, on "Progress in the Metallurgy of Copper." Lecture I.

Wednesday, December 5th. At 4.30 p.m. Inaugural Trueman Wood Lecture, by Sir Dugald Clerk, F.R.S.

Society of Engineers.—Monday, December 3rd. At 5 p.m. At the Geological Institute, Burlington House, Piccadilly, W. Lecture on "High-speed Railways after the War," by Mr. Chalmers Kearney. Tickets (free) from the Secretary, 17, Victoria Street, S.W. 1.

Institution of Civil Engineers.—Tuesday, December 4th. At 5.30 p.m. At Great George Street, S.W. Paper on "Recent Developments in By-Product Coking," by Mr. G. B. Walker.

Association of Supervising Electricians.—Tuesday, December 4th. At 7.15 p.m. At St. Bride's Institute. Paper on "Transformers."

Institution of Electrical Engineers.—Thursday, December 6th. At 6 p.m. At the Institution of Civil Engineers, Great George Street, S.W. Paper on "Electrical Cooking as applied to Large Kitchens," by Mr. W. A. Gillett.

(Birmingham Local Section).—Wednesday, December 5th. At 7 p.m. At the University, Edmund Street. Paper on "Gas Firing Boilers," by Mr. T. M. Hunter.

Greenock Electrical Society.—Thursday, December 6th. At 7.45 p.m. At 22, West Stewart Street. Paper on "Wireless Installation," by Mr. G. Reid.

Chemical Society.—Thursday, December 6th. At 8 p.m. At Burlington House, Piccadilly, W. Lecture on "The Relation between Chemical Constitution and Physiological Action," by Dr. F. L. Pyman.

NOTES.

Corrections.—Owing to an obvious slip in connection with the final proofs of our leading article last week, a slight confusion occurred on page 182; lines 18 to 50 in the first column should have been deleted. In line 55 for "as" read "at."

An Institution of Electricity Supply Engineers.—We have received a copy of the following letter, which explains itself:—

H. W. Healy, Esq.,

Battersea Borough Council Electricity Works,
Battersea.

INSTITUTION OF ELECTRICITY SUPPLY ENGINEERS.

Dear Sir.—The result of the meeting held at the Hammersmith electricity works, on November 5th, proved such interesting reading and potential of such far-reaching results that a meeting of the whole of the assistant technical officers of the Sunderland Corporation electricity department was convened yesterday to discuss the report published in the current Press.

Whilst admitting that the scheme is as yet in a state of flux, nevertheless the broad ideals aimed at in the prospective institution, together with the responsible character of the Provisional Committee elected to consider the constitution of the same, received the unanimous approval of our meeting, and the undersigned were delegated to forward you this letter in sympathetic support.

The reasons animating the electricity supply engineers in the metropolis exist in equal degree throughout the provinces, and we have, therefore, forwarded a copy of this letter to the technical Press, in the hope that all the provincial undertakings, both municipal and company, will follow our example and send along to you an expression of their sympathy with, and approval of, the movement, in time to be submitted at the general meeting to be held in London in due course.

The start made in London has been so auspicious that we look to the rest of the provinces to fall in line voluntarily and without delay, as the fundamental success of the prospective institution depends entirely on its membership being of a national character.

We hope in the near future to convene a general meeting on the North-East Coast of all the senior electricity supply engineers between the Tyne and Tees, with the object of furthering the movement in this part of the country, and trust this intention will be of assistance to the Provisional Committee.

S. R. WINDLE. J. W. TOWNLEY.

WILFRED YORKE. B. J. R. BUSHNELL.

Sunderland, November 27th, 1917.

National Insurance (Part II) (Munition Workers) Act, 1916.—The following is a further decision of the Umpire:—

2,393 X. Workmen engaged wholly or mainly in the manufacture of metal signs for advertising purposes.

Notice is given that the Umpire has received application for decision as to whether contributions are payable or not in respect of the following class of persons:—

502. Workmen engaged in making gas bags for motor-cars.

The Umpire proposes to give his decision on the above application on or after December 10th, 1917, and representations should be made before the 7th.

Colliery Signalling Patents.—A decision has just been given by the Chief Examiner of Patents in connection with a patent application of the Sterling Telephone and Electric Co., Ltd., and others, for signal cancelling apparatus (No. 105,659, dated May 31st, 1916), which had been opposed by the Automatic Telephone Manufacturing Co., Ltd., on the grounds of their prior British Patent No. 18,780, of 1914, and unfairness and inadequacy of description.

At the hearing on November 7th, Mr. Courtney Terrell appeared as counsel for the opponents, and Mr. H. W. K. Jennings, of Messrs. W. P. Thompson & Co., of London, as patent agent for the applicants. In opening the case, Mr. Jennings explained clearly the distinctive features and advantages of the Sterling system, and contended that the applicants' specification fairly defined the exact scope of their invention.

Mr. Terrell maintained that the applicants' invention was claimed in the opponents' Claim 5.

The Chief Examiner decided that neither of the relays described and claimed by the applicants had functions similar to the opponents' first relay; further, that applicants' invention did not fall within the opponents' Claim 5; and, finally, that the applicants' specification was perfectly fair, and gave sufficient notice to the public as to the prior art.

The opposition was accordingly dismissed, with costs.

Australian Electric Steel.—The first plant of the Australian Electric Steel, Ltd., is situated at Alexandria, Sydney, and is equipped with a 2-ton Electro-metals two-phase furnace, supplied from the 5,000-volt three-phase circuits of the City Council through Scott-connected transformers. This plant has been in operation about eight months, and its output is principally castings low in carbon, and special alloy steel castings for mining and electrical work; the charge is common steel scrap and pig-iron. The success already achieved has been such that the company has already commenced the erection of a similar plant in Western Australia. Mr. J. M. Deschamps is the managing director, and Mr. T. D. Robertson (M.M., Sheffield) the metallurgist to the company.—*Commonwealth Engineer*, Vol. V, No. 2.

Reconstruction and Trade Policy.—In Parliament, last week, Mr. George Terrell asked the Minister of Reconstruction whether, in connection with his work of reconstruction of British trade, he was proceeding on the basis that after the war British manufacturers would be protected by a tariff against foreign imports, or on the basis of free trade. In reply, Dr. Addison intimated that the question of the fiscal policy after the war was being considered by Lord Balfour's Committee on Commercial and Industrial Policy.

A Ministry of Health.—At a conference called by the Council of the Faculty of Insurance, on Saturday, Dr. Addison said the Insurance Act had demonstrated to the public that ill-health was very expensive. As Minister of Reconstruction it fell to his lot to do what he could to try to arrive at an arrangement for dealing with health matters which would be workable, comprehensive, and practical, and to bring into it, as far as possible by agreement, the various parties concerned in the preservation of the public health. At the Ministry of Munitions he set up a Committee to investigate health matters. It made some interesting discoveries. A set of women turning aluminium fuse tops were working 66 hours a week. Take their hourly output as 100. Then these same women worked a period of weeks of 54.8 hours. The hourly output was 131. They worked a period of weeks of 45.6 hours, and the output was 158. It paid that factory to employ these women only 45 hours a week. Similarly, there was a set of boys working 72 hours a week boring topcaps. Taking their output at 100 per hour, their hourly output, when they worked 51 hours a week, was 117, and when they worked 53 hours 119. A reduction of hours from 58 to 51 of men engaged on heavy work increased their hourly output from 100 to 139. One of the vital matters after the war was to increase the productive power of the nation, and investigations of that kind were of a singularly important and fundamental character. Above all things, accurate information was needed, and he was going to try to get it. The first thing to do was to get a central health authority, but he did not anticipate that anybody nowadays with the experience of war control would want everything to be done by a Department in Whitehall. They must look forward to a great measure of decentralisation. He had been charged to get into touch with the interested people and to formulate a plan.—*Morning Post*.

Electrometallic Effects Across Very Thin Insulating Sheets.—Monsieur Brany, in continuation of his important communication to the Paris Academy of Sciences, has studied the unipolar conductivity of certain couples—e.g., galena-platinum wire or galena-copper wire. These couples, under suitably regulated contact pressure, allow the current to pass in one direction but not in the other. A similar unipolar conductivity is observed with a sheet of mica interposed between two metallic disks of different substances, specially selected. It is not, however, only in the unipolar conductivity that the nature of the metals embodied in a mica condenser plays an important rôle. This feature is also evident in simple conductivity experiments, where certain associations of metals are found to be more advantageous for ensuring the conductivity of the mica. Two metallic surfaces placed opposite each other exercise a specific external influence across the intermediate medium by the action of a low E.M.F. at distances which are sufficiently great to be measured directly.

Science and the Civil Service.—The Committee on the Neglect of Science has issued a pamphlet dealing with the Report of the Committee appointed by H.M. Treasury to consider and report upon the scheme of examination for Class I of the Civil Service. The Civil Service Committee has recommended that there should be two examinations—one a qualifying examination to be taken by all candidates, and the other a competitive examination; but no subjects are made compulsory, so that no necessity is put upon the headmasters of the great Public Schools to give any more attention to science than has hitherto been the case.

The recommendations of the Committee stop short after securing "equal opportunity" for all subjects. With regard to the Natural Sciences, the Report expressly states that the Committee declines the responsibility of making education in them a necessity. The scheme gives the equal opportunity; "the schools and Universities must do the rest." The difficulty remains as before—namely, that the schools and Universities are, to a large extent, in the hands of teachers of the Classics. In the great Public Schools the headmasters are, without exception, "Classics," the Natural Sciences are treated with neglect, and their importance as an essential and dominant part of sound education is ignored.

The object of the Committee on the Neglect of Science was, and still remains, to obtain from the Civil Service Commissioners such a scheme of examination as would compel the managers of the great Public Schools to adopt a more intelligent scheme of education. The Commissioners are the only body in existence which can put pressure on the great schools and Universities. Very naturally

but not courageously or patriotically—the Civil Service Committee refuses this responsibility. "Permissive legislation" is the limit of its courage. So it has been in former times in regard to measures for securing the public health, elementary education, and even national defence. But eventually legislation in these matters has taken a compulsory form; and so it must, without further delay, in regard to education. It is simply absurd, says Sir E. Ray Lankester, to allow the great schools and the old Universities to administer great national funds so as to maintain the vested interests of a schoolmaster-class, ignorant of, and therefore hostile to, the most important national interests—the education of our best sons in the knowledge of Nature.

The "Guarantee of Work Scheme" of the E.C.A.—By the courtesy of Mr. H. Marryat, Editor of the *Electrical Contractor*, who has kindly sent us advance proofs of the forthcoming issue of that journal, we are enabled to announce that this important scheme has now been definitely adopted by the Electrical Contractors' Association, after overcoming strenuous opposition. The scheme is set out in the Articles of N.E.C.T.A., Ltd., a company formed by the Association for the express purpose of putting the scheme into practice without infringement of the Charter of Incorporation of the E.C.A.

Our contemporary says:—The Council, confirming its adoption of the scheme, made the date of its being given effect subject to the calling of special meetings of sections and branches opposing, at which members of the Council were to be given an opportunity of speaking on the subject. A series of such meetings has been held, and unanimous votes of approval were recorded in every instance, the unanimous acceptance of the scheme by the Northern Section meeting at Leeds on Saturday, November 3rd, being the final act required to justify the Council in proceeding immediately to put the scheme in operation.

The reason that so much discussion and delay has occurred in carrying out this admirable piece of constructive policy is that the proposal is unique in character, and, like the Daylight Saving Bill, its advantages are far from obvious at the first reading. The advantages to the individual member are indirect and ultimate, whereas many seeming disadvantages are ready to be picked from the surface. Considerable discussion and explanation has been necessary before members generally could be expected to see the Guarantee of Work Scheme in its broader aspect, not as a means of immediate profit to individuals, but as an effective lever to raise the status of the whole contracting trade.

In simple terms the scheme, which is set out in detail in the Articles of N.E.C.T.A., Ltd., provides that on and after a date which will be decided during the next few weeks, the Association as a whole will guarantee that the work of each of its members shall be in accordance with the standard requirements laid down in the Wiring Rules of the Institution of Electrical Engineers, and that the Association will back its guarantee with its purse. Certain exceptions and limiting conditions are imposed, and ample powers are taken for inspection both during erection and after completion of our members' work.

The adoption of the scheme means that henceforward no man who desires to do bad work can find a place within the ranks of our Association, that the E.C.A. stands definitely and finally for good work, and that those members of the I.M.E.A., who, after subscribing to the I.E.E. Rules, persistently encourage slip-socket tubing and other infringements of the rules, will find themselves being left behind in the path of progress.

[We congratulate the Association on this highly satisfactory achievement, the result of five years' strenuous labour on the part of the Council, which will immensely strengthen the Association and increase its prestige. —Eds. ELEC. REV.]

Gas-bag Motor-cars.—Owners of motor vehicles which the Petrol Committee has refused to license have eagerly seized upon the gas-bag as an alternative, and enormous numbers of cars are being converted to gas. As this work is employing men whose services are urgently required for essential war work, says the *Times*, it is highly probable that the use of gas in such cases will be prohibited.

A Manchurian Electric Locomotive for Mines.—H.M. Consul at Dairen (Mr. H. G. Parlett) has forwarded a copy of the specification of an electric locomotive which has recently been built at the South Manchuria Railway Co.'s works at Shakako, for the use of the Fushun mines. It was proposed to build seven other locomotives of a similar character by the middle of November. It is understood that this is the first attempt to build this kind of locomotive in Manchuria, supplies having hitherto been obtained from Germany or the United States of America. British firms interested may consult the specification at the Department of Commercial Intelligence in London.

Electrical Rain-Making in Australia.—At the final meeting of the Rain Precipitation Investigation Committee, held on October 3rd, the Committee placed on record the fact that no information whatever had been submitted for the consideration of the members which justified the claim that any advance had been made in Australia in the direction of causing, or increasing, rainfall. The Committee was appointed by the Premier towards the end of the year 1915 to investigate certain claims of Mr. Balsillie in connection with rain-making by electricity.—*Sydney Daily Telegraph*.

The Minister of Works and Railways has agreed to a practical trial of the Balsillie rain-stimulating device at Hopetoun, in the Mallee. At this centre there are complete rainfall data extending over many years, enabling a reliable comparison to be made. Experiments with the device are being continued at Wynbring, on the route of the Trans-Continental Railway.—*Melbourne Age*.

Steady Arcs for Bioscopes.—In order to retain the arc in focus, the negative carbon of a bioscope arc is often made of smaller section than the positive, and to maintain its conductance it is copper plated. The copper has a tendency to collect in molten beads on the tip of the carbon, which splutter when the arc touches them, causing undesirable flickering and projecting molten metal on the lens, to which it adheres firmly. The formation of these beads can be entirely prevented by a nickel coating over the copper sheath. This device has been patented by Mr. B. Perris, of Lakewood, Ohio, U.S.A. (U.S. Patent No. 1,241,710). *Electrical World*, Vol. LXX, No. 19.

Fatalities.—On November 20th, an inquest was held at Littleborough with reference to the death of Thos. Rayner (36), a machine cutter at the Grove Wiring Co.'s works. By a short-circuiting of the motor and a connecting wire to a fixture on the machine, the cutting machine at which Rayner was working on the previous Saturday became alive. His assistant, J. T. Taylor, said that deceased, who had gone to the lever, was clinging to the guard round the main driving strap, and looked as though he were in a fit or seizure. He was gripped to the guard, and his face was discoloured and contorted. Then he was suddenly twisted off, and fell on the floor. All the place round the motor seemed charged. Medical evidence showed that deceased had died from shock.

J. E. Russell, the electrician in charge at night, described the fitting quite recently of an electric fan to carry the dust off the machine in question. It was done under the direction of the chief electrician and himself. The machine was driven by steam. The 6-h.p. motor which drove the fan was a few yards away. The dust was carried up a 12-in. pipe. From the motor to the pipe ran a piece of wire a twentieth of an inch in thickness, and the pipe was metallically connected with the machine. The wire was used to steady or stay the pipe, and did not strike him as being dangerous, though they had seen that that was the means by which the machine became electrified. He never drew the attention of a new man to it. He had changed his opinion now. It was obvious from the condition of the cover over the motor leads that electricity had been passing into the cover. This leakage had made the whole motor frame alive, and the current then passed along the small stiffening wire to the fan pipe, and so made the whole metal part of the machine alive, and anyone touching the machine and standing on the concrete floor would have the full force of the shock. There was no earth wire on this motor, though there were on all the others. After the accident the wire was red hot. One of the terminals had jumped, and the electricity had escaped into the motor frame.

The Coroner said it was a grave mistake to connect the wire with the motor when it could quite as easily have been fixed to the wall, and it was a grave error that the motor had not been properly earthed, but he thought the jury would find there was no criminal neglect. A verdict of "Accidental death" was returned.

A Goods Clearing House for Railways.—Sir Albert Stanley, President of the Board of Trade, on November 24th, received an influential deputation urging the need for reform of the railway system, particularly in the collection and distribution of merchandise. Mr. A. W. Gattie explained the system proposed for the collection and distribution of goods, and asked the President to appoint a Committee of Inquiry vested with full powers to carry out a thorough investigation of the scheme. Sir Albert Stanley gave a lengthy and sympathetic hearing to the deputation.

Wages in Metropolitan Electricity Works.—The Town Clerk of Hammersmith has sent out a circular-letter stating that from time to time the question of rates of wages paid to different grades engaged in the Council's electricity undertaking has been brought before the appropriate Committee of his Council, sometimes upon an application of the men concerned, and at other times upon a representation by one or other of the Unions claiming to represent the different sections of men. His Committee has felt a certain amount of difficulty in dealing with such applications in a proper manner, owing to the uncertainty of the effect which any action which it might take might have upon the position of other generating stations. In the cases of applications brought forward by societies claiming to represent certain classes of men, the difficulty has been complicated by the uncertainty as to how far such societies are representative of the classes of men concerned. In these circumstances, the Committee expresses a general agreement with a proposal that, if possible, there should be a Federation of Electrical Supply Authorities in London and Greater London, whose particular function it would be to consider, from a federation point of view, the rates of salary and wages paid to persons engaged in the generation and distribution of electricity. Should such an organisation be formed, it would become a natural medium for the discussion of work and rates of pay amongst the persons affected, whether such discussion was with the sanction of the men direct or with some society recognised as representing the men. Other Councils are asked if they are prepared to assent to the suggestion, or if they think the matter is one which should be discussed at a meeting of representatives of electricity undertakings.

Hackney Borough Council has also sent out a circular to the effect that its Committee has had under consideration a communication from Sir George Askwith, dated September 17th, enclosing a memorandum as to a conference, which was held on September 6th, on the question of working conditions and rates of pay in the power stations of London. The Electricity Committee is of opinion that the several authorities owning electrical undertakings in the metropolis, before binding themselves to form a body to deal with working conditions and rates of pay, should meet in conference with a view to deciding whether the principle suggested in Sir George Askwith's communication would be acceptable, or otherwise. Councils are asked to appoint delegates to the last-mentioned conference.

Hackney Electricity Committee reports that the Wages Conference of Municipal Authorities in Greater London owning electricity undertakings has held its first meeting; many of the authorities have appointed delegates, and officers have been appointed in connection with the Conference. On the Executive Committee all members have voting power, but in the Conference the vote is to be by undertakings.

On the 6th inst. the Conference passed the following resolution:

tion:—"This Conference recommends the adoption of the award of 15s. increase on the pre-war wage to all employes affected by the awards of the Committee on Production and to the technical staff, to date from September 1st, and such 15s. to be inclusive of any increase granted since August, 1914, as war bonus or war wages."

The Committee recommends that the chairman and ex-chairman for the time being of the Electricity Committee, together with the borough electrical engineer, be appointed to act as delegates on behalf of the Borough Council at the Wages Conference, with authority to treat with employes' representatives as to the question of securing uniformity of wages and working conditions of men engaged in electricity undertakings.

Jacks for Tramcar Accidents.—At an inquest at Newcastle-on-Tyne, on the 26th inst., on a child who had been killed by a tramcar, it was stated that the child was under the car when it was pulled up after the accident, and being beyond the motor-case, could not be got at through the trapdoors inside. It was about half an hour before a breakdown gang got to the scene of the accident. Coroner Appleby said that was not the first accident of the kind, and people were under the impression that if jacks were carried on the cars, they would be sufficient to lift the vehicles. A tramcar inspector said that if jacks could be carried, it would be necessary to have men who understood the work to use them, or they might tilt the car over. Mr. E. Hatton, general manager of the tramways, said the question of using jacks was not new in the city, and had been discussed in other towns. He had had inquiries from other tramway systems as to the methods adopted in cases of accidents of that kind. What they did was to communicate with the nearest depot, and the men turned out with what jacks they had. The Haymarket depot also was informed, and the wagon, which was supplied with all kinds of appliances, and was always in readiness, was sent out to the scene of the accident. In that particular case, the Byker men turned out with 5-ton jacks, which lifted the car (which weighed 11 tons) some 12 in. That was not sufficient, and from the breakdown van they obtained larger jacks, which could not be carried on a tramcar. It was not a question of money that affected the fitting of jacks on cars, but the suitability of the machinery to do the work. He could not see at the present time any better method of dealing with those accidents, but if a more expeditious method could be devised it certainly would be adopted. In cases of accidents on steep inclines, the lifting had to be carried out by persons possessing engineering knowledge. The verdict was one of "Accidental death," and no blame was attached to the driver.

Electric-Light Switching.—From Messrs. A. P. Lundberg and Sons, 477-489, Liverpool Road, London, N. 7, we have received a copy of a new preliminary-grade examination paper on this subject. We are informed that anyone can obtain a copy on application, together with other particulars regarding these free home examinations. The paper itself includes a set of rules for the guidance of examinees, and the new set of 11 questions shows no falling-off in practical and interesting points. Up to June last, 637 examinees had gained the preliminary-grade certificate, not to mention those holding intermediate and advanced certificates.

Appointments Vacant.—Testing assistant (45s.) and shift engineer (40s. +), for the Islington B.C. electricity department; junior shift engineer (£156) for the Corporation of Leicester tramways and electricity department; engine attendant (60s. to 70s. +), temporary sub-station attendant (30s. to 40s. +) for the L.C.C. tramways department; assistant draughtsman for Edmundson's Electricity Corporation; meter superintendent (£160 +), engineer in charge (£175 +) for the Hammersmith B.C. electricity department. See our advertisement pages to-day.

New South Wales Labour Troubles.—The latest mail advices from Sydney indicate that the strike is over. The New South Wales Government is working 15 collieries, which should to-day be raising 7,000 tons per day; in the middle of September there was a reserve stock of 200,000 tons of coal. The majority of the mines are being worked at a fixed price per ton, the Government paying the cost of railway fares and the camp expenses of the loyal volunteers. Encamped at the Sydney Cricket Ground and Taronga Park are 6,000 country volunteers, who practically monopolise the wharf labour. A new Union of Waterside Workers has been formed, having as a basis a minimum weekly wage, instead of payment by the hour as at present. Up to the end of September, applications for new registration were received from eight newly-organised Unions by the N.S.W. Government.

Localising Metal in the Human Body.—Dr. F. H. Hackett and Mr. J. W. Greenwood, electrical engineer, both of Halifax, have invented and patented an instrument known as the "metalocophone," on the telephone principle, for the localisation of shrapnel or other metal in the human body. A searcher is moved over the patient's body, and on its approaching metal in the body a humming noise is heard by the operator in a receiver. An incision in the flesh is followed by the insertion of a probe, which, by the same method of sound, guides the operator to the position of the metal. It is further claimed that the appliance also indicates whether the metal is magnetic, in which case it can be extracted by an electromagnet. The instrument weighs 4 lb.

Stealing Tramcar Lamps.—During the past few days no fewer than a score of boys have been before the Liverpool Stipendiary charged with stealing electric glow lamps from the rear of tramcars. A birching has been the usual penalty inflicted.

Volunteer Notes.—COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).—Headquarters, Balderton Street, Oxford Street, W. 1.

Orders for the week, by Lieut.-Colonel C.B. Clay, V.D., commanding:—
Officer for the Week.—Second Lieut. H. G. Golding.
Next for Duty.—Second Lieut. P. Bowden.
Drills.—Week ending Saturday, December 8th, 1917:—
 Monday.—No. 3 Company, Left Half. Recruits, signalling, 6.30.
 Tuesday.—Physical drill and layonet exercise, 7.30.
 Wednesday.—No. 1 Company, 6.30.
 Thursday.—No. 2 Company, 6.30; signalling, ambulance, 6.30.
 Friday.—No. 3 Company, Right Half. Recruits, 6.30.
Muster.—Belvedere Road, Tuesday, Wednesday, and Thursday, 5.30 to 7.
 The Medical Officer will attend for examination of recruits, &c., on Thursday, at 6.30.

(By order) MACLEOD YEARSLEY, Capt. and Adjutant.

Institution and Lecture Notes.—Physical Society of London. At the meeting held on November 29th, the President, Prof. C.V. Boys, F.R.S., referred briefly to the great loss which the Society had sustained since the last meeting in the death of its treasurer, Mr. W. Duddell, F.R.S. A paper "On the Thermo-Electric Properties of Fused Metals," by Messrs. C. R. Darling and A. W. Grace, was read by the former. In a previous paper the authors described experiments with bismuth, the apparatus then used only being capable of furnishing readings up to 560° C. Methods have now been devised by which the metals examined may be heated in the tube of an electric furnace, and observations made up to the temperature limit of the furnace. The metals experimented with were lead, tin and antimony up to 1,000° C., and zinc and cadmium up to temperatures approaching the boiling point. No change in thermoelectric properties was noticed at fusion, except in the case of antimony, which, like bismuth, shows an abrupt bend in the E.M.F. temperature curve at the melting point, 632° C. This exceptional behaviour of antimony and bismuth is in keeping with the anomalous properties of these metals, both of which expand on solidification; and it is suggested that an allotropic change occurs at fusion in these metals. In the case of lead, which is used as the reference metal in thermoelectric diagrams, it is shown that extrapolation of lines in the diagram beyond 300° led to serious errors, and that although at low temperatures the E.M.F. temperature curves are approximate parabolas, the departure from this shape above 300° is so marked as to render thermoelectric diagrams of little value.

In the discussion, Mr. Whipple said that this work opened up certain possibilities of commercial importance, as it appeared that information could be obtained of the thermoelectric properties which a particular alloy would have while it was still in the molten state. It would thus be possible, by adding one or other of the constituents as required, to obtain an alloy with any prescribed thermoelectric properties. At present the alloy had to be allowed to cool, and a wire of it drawn and tested. If it were not right, it had to be melted up again and its constitution altered, which was a troublesome method. Northrup had suggested a tin-graphite thermometer for high temperatures up to about 1,700° C., on the same lines as the ordinary mercury-in-glass thermometers. The tin expanding along the stem of the thermometer moved an index wire, by which the temperature was indicated.

Institute of Metals.—The Hon. Sir Charles Parsons is to give the annual May Lecture before the Institute next spring, and will deal with the subject of the formation of diamonds. For over 30 years he has been experimenting upon the production of artificial diamonds, and an account of his researches cannot fail to be of the greatest interest. A ballot for the election of members of the Institute is due to take place on December 12th. Forms of application for membership can be obtained from Mr. G. Shaw Scott, M.Sc., Secretary and Editor, 35, Victoria Street, Westminster, S.W. 1. The present year has witnessed a remarkable growth in the Institute's membership from 660 to over 860.

Keighley Association of Engineers.—Lecturing last week on "Our Sources of Energy and Some Possibilities in Connection with their Fuller Utilisation," Prof. Watkinson, of Liverpool University, alluded to the danger of our present method of drawing upon our reserves of coal and oil. Sixty-five million tons of low-grade fuel, he said, was being wasted annually under present methods, but could be utilised by a proper scheme of electrical distribution, in which form, with a concentration of plants in the neighbourhood of coal fields, very great economy could be effected. By-products could be procured, and from the coal burnt at the present time we ought to be able to get 200 million tons of tar, from which could be got about 8 million tons of tar oil for engine uses and oil traction or shipping. If the coal, also, were properly gasified, benzol and ammonia, and sulphate of ammonia for manure, would be procured in great quantity. The Professor insisted that the distribution under such scheme would have to be taken in hand by the Government, and trunk lines of 70,000 to 100,000 volts should be laid down, these trunks being tapped by the municipalities, who would further distribute the energy. Under present conditions we could look for very little further fuel economy.

Chadwick Public Lectures, Leicester. The second of the Chadwick Lectures at Leicester Museum, on "Electricity and National Welfare," was given by Prof. H. T. Davidge on November 24th, the title being "Electricity and Increased Food Production." After dealing with the heat values of various foods and the connection between the calorific and mechanical work, the problem was approached of the necessity for increasing plant growth by electric action. The case of "Electroculture" was first taken, and various methods were explained. Statistics were given indicating that great increases might be possible in this way, but the lecturer indicated that further accurate quantitative research work was necessary before hard and fast rules could be formulated. Next was shown the importance of nitrogen in the growth of wheat,

and how necessary it was to give a large supply of this element in a form which the plant could assimilate. The fixation of atmospheric nitrogen was explained, and statistics were given showing the growth of the industry. The importance of cheap power was emphasised, and it was made clear that a load of the necessary kind was admirable to level up the "load factor" of large power stations near coal and water. Lastly, under a scheme of high-pressure electric-supply networks extending over large tracts of the country, it was shown that the farmer of the future could tap cheap power for all farm purposes, including haulage transport, and much was to be hoped for from such systems of supply.

A Reliable Machine.—The aeroplane used by the airman who journeyed from England and dropped bombs round Constantinople, last July, was a Handley Page, of British manufacture. The magneto also was British, made by members of the British Ignition Apparatus Association.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—On November 9th Mr. H. FARADAY PROCTOR celebrated his 25th year of service with the Bristol Corporation as engineer and general manager to the electricity department.

The Bispham (Blackpool) U.D.C. has increased the salary of the electrical engineer from £140 to £200, and that of the assistant electrical engineer from £130 to £180 per year.

The Fleetwood U.D.C. recently advertised for an assistant electrical engineer at £150 a year, rising to £175. Sixty-one applications were received. The appointment has not yet been made.

The salary of Mr. S. KIRKWOOD, assistant engineer at Shrewsbury electricity works, has been advanced by £25 per annum.

Mr. G. W. MALLINS, general manager of the Liverpool Corporation tramways, met with an accident the other day, owing to restricted lighting. He fell on the pavement and injured his knee, and it may be some time before he can resume his duties.

The London County Council Highways Committee recommends that Mr. W. CRAWFORD and Mr. E. T. HOLT, acting assistant permanent-way engineers, be appointed assistant permanent-way engineers in the tramways department at £325, rising by annual increments of £25 to £400 a year.

The Coventry City Council has advanced the salary of Mr. T. R. WHITEHEAD, the tramways engineer, from £600 to £700 per annum.

General.—Mr. J. F. SELLS, of the engineering staff of the National X-ray Reflector Co., has been appointed as consulting illuminating engineer for the new business departments of the Henry L. Doherty Co., central stations.

The St. Pancras Electricity Committee has appointed Com. G. F. PARSONS as its chairman, and Com. W. G. GREY as deputy-chairman.

The *Irish Builder* states that Mr. W. PLEASANCE, M.I.E.E., Belfast, has been appointed teacher of electrical engineering to the Technical Institute at Portadown.

Canada states that Sir HENRY DRAYTON, Chairman of the Board of Railway Commissioners, has been appointed Controller of Production and Distribution of Electrical Energy in the Province of Ontario.

Mr. C. H. WORDINGHAM, President of the Institution of Electrical Engineers, has accepted office as one of the vice-presidents of the British Electrical and Allied Manufacturers' Association (Incorporated).

The Islington Borough Council Electricity Committee has unanimously re-elected Ald. H. B. VOSELEY to the position of Chairman for the 13th year in succession, thus paying a tribute to the value of his services to the electrical undertaking. Com. E. T. LUXLOW, a local electrical man, was unanimously elected Vice-Chairman for the ensuing year. Both of these gentlemen are delegates to the Greater London bulk-supply conference.

The following constitute the Bristol Corporation Electrical Committee for 1917-18:—Ald. G. Pearson (chairman), A. E. Thomas (vice-chairman), Ald. C. P. Billing, I. M. Dunlop, C. T. Enwright, J. H. Gibbs, J. Littleton, J. Milton, E. J. Neale, A. A. Semington, W. G. Pope, C. R. Perrett, and E. H. Stock.

Roll of Honour.—Second-Lieutenant J. W. PARKER, M.C., West Yorks. Regiment, who was on the staff of the Leeds Branch of the General Electric Co., Ltd., died on November 13th as a result of gunshot wounds received in action.

Private J. SNOW, King's (Liverpool) Regiment, who has been killed in action, aged 23, was employed by Messrs. Dick, Kerr & Co., Ltd., of Preston.

Private J. DONOGHUE, killed in action, was employed by Messrs. Baxendale & Co., Ltd., electrical manufacturers, Manchester.

Private A. Fox, A.S.C., killed, was employed in the battery department of the B.I. & Helsby Cables, Ltd., Prescott.

The Military Cross has been awarded to Lieutenant N. Sizer, R.E. (Signallers), for conspicuous gallantry and devotion to duty on October 4th. He was also mentioned in dispatches last spring. Lieutenant Sizer was an electrical engineer at the Westinghouse Works, Manchester, and is an A.M.I.E.E.

Sapper P. HIRST, R.E. (Signal Section), who has been wounded, was in business as an electrician at Huddersfield.

The death from disease at Dar es Salaam, East Africa, is reported of Sergeant H. E. BISHOP, who joined the R.N.A.S. at the outbreak of war, whilst an electrical engineer with the Western Electric Co., at Woolwich.

Private C. B. JONES, Gloucestershire Regiment, who has fallen in action, was in the lamp shipping office of the B.T.H. Co., at Rugby.

Corporal A. S. TASKER, Essex Regiment, who was prior to the war engaged at the Chelmsford works of the Marconi Co., Ltd., has died of wounds received in action.

Corporal A. RICHARDS, who was on the staff at the Torquay Corporation electricity works, is reported killed in action after being missing since May last.

A commission in the Northumberland Fusiliers has been granted to Corporal F. GARSTON, East Lancashire Territorials, who enlisted whilst on the Corporation tramway staff at Blackburn. He gained the D.C.M. for conspicuous gallantry in Gallipoli.

Private R. W. DYKE, who enlisted from the staff at the Grantham electric light works, is reported missing.

Private W. S. PERKS, King's Shropshire L.I., Lewis Gun Section, killed in action after being twice wounded, was in the telegraph construction department of the Post Office.

Second-Lieutenant H. PROCTER, B.Sc., R.E., who was in civil life on the engineering staff of the B.T.H. Co. at Rugby, has died from accidental injuries, aged 30.

The death in action is reported of Private H. PUSEY, for nine years on the staff of the Tonbridge U.D.C. electricity works.

A bar to the Military Medal for restoring communications under particularly hazardous conditions has been awarded to Sergeant A. E. WRIGHT, R.F.A., who was an electrician at Forest Gate, E.

The Military Medal has been awarded to the parents of Lance-Sergeant W. POLLARD, Essex Regiment, recently killed in action, who enlisted from the staff of Messrs. Joslins, Ltd., electrical engineers, of Colchester.

Private H. GUTHRIE, who was formerly employed in the secretary's office of the Electric Supply Co. at Glasgow, has been killed in action.

Lieutenant H. W. MORGAN, attached R.E.C., who was on the office staff of the Liverpool Corporation tramways, was killed in action on November 8th.

Second-Lieutenant A. W. H. PURNELL, R.G.A., aged 21, is reported missing. He took a course of electrical engineering at the State University, Coethen, Hainault, Germany, and returned to the Empress Works, Loughborough, of which his father was a director. He enlisted in October, 1914.

Obituary.—DR. E. F. ROEBER.—From the pages of *Metallurgical and Chemical Engineering*, we learn that the editor of that excellent journal, Dr. E. F. Roeber, died on October 17th at the age of 50. Of Saxon birth, he was exceptionally well trained in science and engineering, and in 1899 he became assistant to Dr. Carl Hering, thus commencing his career as a leading authority on electrochemistry. In 1902 he was appointed editor of *Electrochemical Industry*, later renamed as above. He was an indefatigable worker, a great technical editor, an invaluable supporter (and one-time president) of the American Electrochemical Society, and a "patriotic, loyal American citizen without any reservation," who had left Germany as an hereditary opponent of "Prussianism."

MR. W. STORK.—We regret to record the death of Mr. Wm. Stork, who had been in the employ of Messrs. L. Frankenburg & Sons, Ltd., for several years.

MR. A. M. CHANCE.—We regret to record the death of Mr. Alexander M. Chance, of Messrs. Chance Bros. & Co., of Oldbury and Birmingham, aged 73 years. The deceased gentleman devoted himself assiduously to the interests of his firm's employes and the well-being of their families, many institutions being started by him for their benefit. Twenty-four years ago he read a paper before the Church Congress on the "Duties of Employers toward the Employed." He declined Parliamentary honours, but worked almost ceaselessly in connection with social and other local causes until his removal to Torquay, in the interests of his health, several years ago.

MR. J. C. MERRYWEATHER.—The death occurred on November 24th of Mr. J. C. Merryweather, head of Messrs. Merryweather & Sons, the well-known fire-engine and pumping machinery manufacturers. He was 77 years of age.

MR. A. J. BAKKER.—We regret to learn from the Sloan Electrical Co., Ltd., of the death, which occurred on 18th inst., of Mr. A. J. Bakker, of Messrs. Philips' Glowlamp-works, Ltd., of Eindhoven. Mr. Bakker was well known in this country and the Colonies, and his many friends will receive the news of his death with sorrow.

MR. W. K. PARTINGTON.—We regret to record the death of

Mr. W. K. Partington, a well known electric wiring contractor, which occurred at his residence at Tottenham on 22nd inst. The deceased gentleman served his apprenticeship in the L. & N.W.Ry. workshops at Crewe, and subsequently commenced business as an electrical contractor. He was connected with power and lighting work for over 30 years. We are informed that his business will be continued by Mrs. Partington.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

James Keith & Blackman Co., Ltd.—Satisfaction in full on November 16th, 1917, of second debentures dated January 6th, 1913, and January 7th, 1915, amounting £700.

Re-issue on November 15th, 1917, of £1,100 first debentures, part of a series already registered.

Alfred Danks, Ltd.—Particulars of £14,000 debentures created October 25th, 1917, filed pursuant to Section 94 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

Bastian Electric Co., Ltd.—Particulars of £2,000 debentures created September 3rd, and secured by trust deed dated November 12th, 1917, filed pursuant to Section 94 (3) of the Companies (Consolidation) Act, 1908. None of the debentures have been issued at present. Property charged: First, second, and third floors at 185, Warldout Street, W. (dearshold), and the company's other property, present and future, including uncalled capital. Trustees: R. H. Forman & R. G. Warner.

CITY NOTES.

Auckland Electric Tramways Co., Ltd.—At the annual meeting, held in London on November 20th, Mr. TEGETMEIER, who presided, referred to the substantial increase in receipts for the year, and the almost equal increase in working expenses.

The traffic receipts were better by £7,914 than in the previous year, and the passengers carried were nearly a million more. The adverse conditions had not varied much during the year. While they were a long way from showing the expansion of pre-war days, the increase of £15,000 in traffic receipts during the past two years was sufficient to make up for the increase in expenses. When, after Peace, the men of Auckland returned to industrial activity the development of traffic of the war period would make greater progress. In the meantime it was satisfactory that they were able to maintain the dividend at the same rate as for the past few years. Their difficulties with regard to labour and the supply of materials had been intensified. Owing to the coal miners' strike last April it was necessary to curtail the services, but in spite of that fact the car mileage run showed an increase for the year. Power and running expenses increased by £5,835, and repairs and maintenance by £1,674, while £19,391 was expended on renewals and permanent-way reconstruction work. The net profit was £746 better than for the preceding year. The reserves now stood at £263,518. This, considered in relation to their capital and debenture account, and bearing in mind the tenure and terms of purchase of the undertaking by the local authorities, meant that their position was a strong one. The expenses would largely increase during the current year, for they would have much heavier taxation, and the increased scale of wages on the present basis was only operative for part of last year; further, the rise in materials would continue. The traffic receipts showed some improvement, and they hoped that this improvement would continue, so that they might meet the increased expenses without materially reducing the profits.

Castner-Kellner Alkali Co., Ltd.—Net profit £263,322, plus £39,404 brought forward. There is to be placed to depreciation reserve £50,000, and a final dividend of 11 per cent. is to be paid, making 20 per cent. for the year, leaving £45,078 to be carried forward, part of which will be required for further excess profits duty.

Bogotá Telephone Co., Ltd.—In their statement to June 30th, 1917, the directors report continued demands for telephone service. They have been fortunate in being able to proceed with the installation of the new extensions in spite of the difficulty they are experiencing in the exportation of the new plant and apparatus required. The equipment at Bogotá has been efficiently maintained, and the service continues to give satisfaction.

R. Hornsby & Sons, Ltd.—Dividend at the rate of 6½ per cent. per annum, less income-tax, on the ordinary shares for the year.

Northampton Electric Light & Power Co., Ltd.—According to the financial Press subscriptions are being invited for 14,000 "B" shares of £1 each at par.

Power Gas Corporation, Ltd.—Dividend at the rate of 6 per cent. per annum, less income-tax, on the ordinary shares.

Ruston, Proctor & Co., Ltd.—Dividend of 5 per cent. per annum on the ordinary shares.

British Electric Traction Co., Ltd.—The directors have declared the dividend on the 6 per cent. cumulative participating preference stock for the half-year ended September 30th.

Electrical Securities Trust, Ltd.—The accounts for the year show a loss of £629.

Rawlings Bros., Ltd.—The profit for the year ended March, 1917, was £231.

STOCKS AND SHARES.

TUESDAY EVENING.

THE effect of General Byng's splendid victory last Wednesday continues to be the dominating factor in the markets, where cheerfulness and confidence have assisted to fortify prices in most parts. There are a few weak sections, rubber shares, for instance, having given way in consequence of the fall in the price of the material, but investment securities are strong in practically every section, and noticeable activity is again a feature amongst electric manufacturing shares. The campaign in favour of the War Bonds is, of course, diverting capital from Stock Exchange channels to some extent, but there is plenty of money still available for investment, and for speculative investment.

The market for steam railways stocks is steady, but the demands of the railwaymen insist upon the full amount originally asked for in the way of increased wages, and the possibility of trouble by reason of this development is the latest reason for withholding interest from railway stocks generally. Underground Electric Incomes are dull at 82 and the 1s. shares at 6s.

The foreign section is one of the firmest, with the exception of Mexicans, where stagnation continues, accompanied by weaker prices; the truth of the matter is, of course, that no one is buying any Mexican stock at the present time, and until the air clears again they are not likely to do so. Accordingly, the Utilities are depressed, Mexico Trams of both classes showing further falls. Brazilian Traction, however, are a much better market, on account of a fair recovery in the Rio exchange. Anglo-Argentine Tramways Debentures are less in request, the Fives dropping back to 60½, despite the good rate of interest, combined with reasonably good security, which they afford. British Columbia Electrics are also a better market, and the strength of the Indian group is well maintained.

The animation in electric manufacturing shares, as already noticed, is still a feature of the miscellaneous market. General Electric Ordinary have risen to 19½, and business has been marked this week at 19½ and 19½. The Preference are ½ better at 10½. In Electric Constructions there is not so much going on as there was a week ago. The price continues steady at 24s., and the 7 per cent. Cumulative Preference, on which there is a dividend due next month, can be bought at 20s., at which they do not look expensive. Cromptons remain about 13s., and the Preference at 15s. 6d. A very lively market has sprung up in the Ordinary shares of the Hydro-Electric Power & Metallurgical Co. A week or two ago the price stood at 4s.; it crept up gradually to 6s., and this week the shares have been changing hands up to nearly 10s. A Tasmanian undertaking, the company fell upon evil days, and dragged out a dull life until just lately. The most fantastic rumours are current with regard to the profits which the company is said to be making now, but while the price is freely talked to over £1, the cautious observer is inclined to think that the recent movement has been sufficiently rapid, at all events for the present. Victoria Falls Ordinary are firm at 18s. 3d. Edison 15s. paid are steady about 16s. 6d. The fully-paid shares held their rise at 26s. The report is due almost at once, and keen interest is taken in anticipation of what the document may show, it being thought that possibly the directors may take this opportunity of enlightening their fellow-shareholders in regard to rumours which have been current, and which have had the effect of causing the shares practically to double in price. British Insulated 4½ per cent. debenture has risen to 92½, and the 5 per cent. to 92.

Castner-Kellner fell ½ to 3 7/16, on the announcement of the dividend, making 20 per cent. for the year, as against 22 per cent. in the previous twelvemonth. This was a disappointment, and the report will probably explain its reason. It may have to do with the recent prohibition of the export of chemicals abroad, a factor which also is affecting rubber shares to some extent, inasmuch as it is feared that with chemicals forbidden and a large quantity is taken for the rubber estates—trees may suffer for lack of them. At the same time, it is thought that the prohibition may be relaxed in regard to rubber estates, but this for the moment is in the air.

One of the jobbers yesterday complained, with a twinkle in his eye, that he would soon be all money and no stock. In other words, the bulk of the supply which he has on his books was being taken from him, and this is the case with other sources of supply as well. Quotable changes are few, but the difficulty remains of obtaining stock. Globe Ordinary at 13½ are 7s. 6d. up, and Cuba Submarines gained the same amount at 9. The telephone market is also firm, with

Oriental another ½ to the good. Optimism has revived in the Marconi market, the parent shares rising to 3½ and Americans sharply spurring to 24s. 6d. on buying from the North of England; Canadians, Marines, and Marconi Preference also show advances. One of the Stock Exchange tips of the moment is to buy American Marconis, and not for a rise of a few shillings only. Most people who have had experience on them are not enamoured of what they call House tips, but occasionally these turn out to be right, and certainly there is a wide scope for prosperity in the case of the American Marconi concern.

The County of London Electric Supply Co. gives notice of its intention to apply to Parliament for leave to bring in a Bill for specified purposes, namely, to confer the power of paying interest out of capital in certain cases, to extend the time for the compulsory purchase of lands in Barking, and to make certain alterations in the Memorandum and Articles of Association. The price of the shares remains unchanged at 11 for the Ordinary and 10½ for the Preference. A few Westminsters came in, and the price eased off to 6½, but otherwise no alterations have occurred in the list. There is a little business doing in the principal shares, but, as we have so often stated on previous occasions, this is limited by the fact of there being so little floating supply to meet the demand.

Buoynancy has characterised the market in armament shares, though prices came back a little from the best. Iron and steel issues are booming, the demand for them in their local centres being surprisingly large, and overflowing into the London market. Shares connected with the base metals have been active, more particularly those of the Broken Hill group, while the record prices touched for tin have been instrumental in lifting quotations in markets associated with the metal.

SHOULD THE CHIEF CONCERN HIMSELF WITH DETAIL?

By "ROVER."

Most works have grown from small to big, and often the Chief has grown with them. Present at the inception, he has been cognisant of every detail of the little plant, and has unconsciously grasped every detail of growth. And now has arrived a stage when one small head seems unable to cope with all the particulars, and there is an increasing opinion that the Chief's job is to organise and to decide. Detail is to be dealt with by the subordinate.

The American technical Press, and the more powerful American fiction Press, have almost finished the debate with the decision that the Boss is Boss, and not chief engineer, nor chief electrician, nor chief clerk, nor chief anything but Chief. In big production the man who sets out to know everything is taking on a burden heavier than can be borne, and is inviting breakdown. In America, the man of detail has lost the affection of the crowd, and the hero to-day is the manager who has courage enough to ignore detail as being the proper province of underlings, who makes his decisions with lightning rapidity, who thinks in millions for a short time daily, and prepares himself for this arduous task by assiduous indulgence in golf and other sedate pastimes. He is necessarily not a young man, has personality, and is not technical or narrow.

Years ago a Chief would know all his consumers personally, whereas, to-day, he can hardly be expected to know even his own staff personally. Changing conditions, too, have seriously impaired the usefulness of the Committee system, adhered to by municipal authorities. This system is responsible for the premature ageing of many a Chief, through its insistence on the importance of detail. Members of a Committee have not all the Chief's broad point of view, and some are bound to have that yearning after trifles which was so useful during the earlier years of the undertaking.

The borough electrical engineer is not the only sufferer. Town clerks, surveyors, and accountants, all have his sincere sympathy. However, government by committee is a doomed *régime* unless it adapts itself to the new conditions.

It does not make for smooth working when the Chief descends to detail. This is in the charge of the heads of departments, and when the "old man" begins to worry himself as to why X's account is 5 per cent. higher than usual, or why there was a lamp out in High Street last night, or why there was only 26 in. vacuum on No. 3 turbo, then it is time that the said heads of departments had a new Chief, or the Chief had new assistants. It is an important part of a Chief's job to choose suitable and capable assistants, and if they prove inefficient the blame is his. Even under the Committee system, the Chief must dominate the Committee and choose his own men. A real Chief will do it, too.

One of the most useful functions of a chief clerk is to protect the great man from detail. Only the most important visitors must ever penetrate to the Holy of Holies. Unimportant visitors, trivial letters, and telephone calls, can be attended to by heads of departments, or by the chief clerk. The latter can probably dispose of these much better than the Chief. Further, all good Chiefs have a hankering after attending to detail and must be saved from themselves. They are as avid for work as a D.C. motor. A good chief clerk is at once a body-guard and a male nurse.

Looking back at my own experience of "Chiefs I have known," there are two that stand out as Chiefs in excelsis. Strangely enough, neither of them was an electrical engineer, although both of them were managers of central stations. One was originally a steam railway manager, who later on took charge of a chain of power plants in America, some hydro-electric, some steam-driven, and one hydraulic plant for supplying compressed air, the two ends of the chain being about 150 miles apart. Of technical detail he was ignorant, purposely ignorant, I believe, and yet maintained an admirable grasp of the production, development, and possibilities of each station. He brought the concern triumphantly through successive periods of amalgamation, rapid growth, and bad trade, mainly by organising ability and long-sightedness. He seemed to recognise no unit

smaller than the station, yet on those rare occasions when detail was forced upon him, he dealt with it in such a matter-of-fact and detached manner, and with such fairness and freedom from personal bias, that his rulings were never questioned. I think he looked upon these little interruptions as an enjoyable relaxation from his more strenuous duties, and probably tackled them all the better for this reason.

The other manager was a lawyer in London, who by some freak of fortune had come into possession of a tiny central station in the provinces. He never went to see the plant, but managed it from his London office. I don't believe he was engineer enough to appreciate the old-fashioned boast of "knowing every bolt and nut in the works," yet he, too, guided his little plant successfully through good and bad times. Naturally, he was more concerned with detail than the other manager just referred to, and his daily letters of advice were often shrewd, untechnical solutions of technical problems worked out in the calm atmosphere of a lawyer's office.

From these instances it would appear that the best Chief is born, not made, which is no new discovery. It appears, further, that the best locale for the best Chief is several miles away from the plant he is managing. From this point of view he is able to see the plant in its true perspective, and the fatal detail does not loom up, obscuring the clear vision of the establishment as a whole. It might be advisable, too, for the Electricity Committee to meet at this same retreat, though, even there, breadth of vision could not be guaranteed to all its members.

THE RÖNTGEN SOCIETY.

At the meeting of the Röntgen Society, on November 6th, the new president, Captain G. W. C. Kaye, M.A., D.Sc., delivered the annual address from the chair. He took for his subject "X-rays and the War," but did not limit his matter to that special range. After reviewing the medical applications of X-rays as, for instance, in the examination of questionable recruits, the investigation of wounds and injuries, the detection of embedded bullet and shell fragments and the nature and direction of bone fractures, the diagnosis of chest complaints, and the use of the rays to the army dentist, he pointed out that the value of X-rays did not end with radiography. The rays were achieving wonderful results, not only in the diagnosis, but in the repair of wounds. The radiologist's part in such work was to render scar tissues pliant, to deplete the scalp and skin surfaces concerned, to render the flaps more adaptable to their new position, and to stimulate generally the healing processes in both flaps and bone. For these purposes radiation treatment, either with X-rays or radium, was now being employed.

The electrotherapist, Captain Kaye continued, had also been prominent in war work. Quite one-half, if not more, of war injuries were gunshot wounds of the nerves with paralysis of the muscles. These cases were sent to the electrical departments, which had been established in large numbers in connection with the military hospitals, for electrical examination of the injured nerves and subsequent electrical treatment. The subject of the diagnosis and treatment of cases of paralysis by electrical methods, such as the application of continuous and interrupted currents and condenser discharges, was being studied on a scale never before possible, and invaluable additions to the knowledge of the pathology of therapeutic methods had been made. Many cases of war wounds, more particularly those of the uncomplicated but inert type which refused to heal, were treated electrically, and "trench feet" received benefit by electrical treatment, in some cases ionisation, and in others high frequency and diathermy.

Turning to the physical aspect of radiology, Capt. Kaye said that it was remarkable how slight had been the changes in design experienced by the target tube, but he would be a bold man, nevertheless, who would assert that the present design had approached finality or anything like it. All X-ray tubes were, in fact, extraordinarily inefficient things. The heat they generated was proof of that. Under favourable conditions, use was made of rather less than one part in one thousand of the energy imparted to the cathode rays in an X-ray bulb. It was the question of gas pressure, as well as the space and surface electrification depending on the disposition of the cathode, that was responsible for the fact that two X-ray bulbs, running under the same conditions of current and voltage, did not always emit beams of the same composition. The new Coolidge tube, in which the surface-bound gas was removed entirely by a process of exhaustion more complete and prolonged than had ever before been applied to an X-ray tube, was not entirely free from defect, and its rays were no more homogeneous than those from an ordinary bulb; but its elasticity, precision, ease of control, and freedom from inverse current made it an invaluable addition to the radiologist's equipment. The anticipation that the Coolidge tube would be the means whereby X-rays

would be obtainable which approximated to the hardest gamma rays from radium had not been realised. The radium rays in question had been found to correspond to X-rays generated by voltages between 600,000 and 2,000,000 figures to which no X-ray tube of present-day design could possibly stand up, even if the means were available to produce such voltages on a practical scale. Evidently there was a long way to go before the processes within the radium atom could be imitated.

Capt. Kaye concluded his address by urging the claims of State-aided research, not only applied, but also pure. Research in pure science was rarely appreciated by the general public or the manufacturer, for it could not be done to order. Much of what the research worker could do must be discontinuous and abortive, but he must not be hampered by utilitarian notions being continually rammed down his throat. If he did not solve the original problem, he would probably solve some other which had sprung from it, and one successful discovery might far outweigh all his failures. The speaker pointed out that the half-watt and point-light lamps, as well as high-potential rectifiers and the explanation of atmospheric electricity and of aurora, were the results of the work of a school—the "ionic" school—which 10 or 15 years ago was considered by many to be speculative and theoretical to a degree.

NEW LOCOMOTIVES FOR THE NEW YORK, NEW HAVEN AND HARTFORD RAILROAD.

THE WESTINGHOUSE ELECTRIC AND MANUFACTURING CO. is building some new passenger locomotives for the New York, New Haven and Hartford Railroad. These will weigh roughly 180 tons and have six driving axles each, instead of four as in earlier locomotives. The maximum capacity will be 50 per cent. greater than any other electric locomotive on this road: tractive effort,

FIG. 1.—NEW HAVEN ELECTRIC PASSENGER LOCOMOTIVE.

47,500 lb. Like other New Haven locomotives, series motors for either A.C. or D.C. will be fitted, the route being third-rail on the New York Central and Pennsylvania tracks, and 11,000-volt trolley on the New York connecting line and at other points.

Geared to each driving axle will be two single-phase series motors. The twelve motors will be divided into four groups, the motors of each group being connected permanently in series. Thus there will be a comparatively low voltage across each individual commutator and the cables in the main motor circuit need only be large enough to carry the current taken by a single motor.

While the new locomotives will be 50 per cent. larger than the present ones, yet on account of the larger hauling requirements

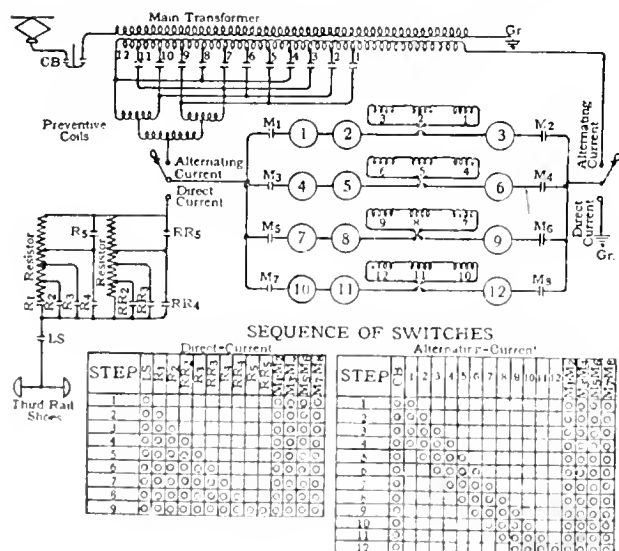

FIG. 2. CONTROL CIRCUITS FOR A.C. AND D.C. OPERATION.

which will eventually exist, it is expected that the trains will operate double headed. The control has, therefore, been developed for multiple unit operation with any of the geared type locomotives now in service on this road. The control circuit connections for both direct-current and alternating-current operation will be as shown in fig. 2. When operating on alternating current the speed control will be obtained by using different transformer taps, preventive coils being provided, so that when changing from one tap to another the transformer coils can be momentarily short circuited

without causing an excessive flow of current. On direct-current operation the usual resistors will be used for starting and for speed control. Temperature coils will be located in the armatures of each pair of motors. These coils will be connected as shown in fig. 3, so that one set can be made the fourth leg of the Wheatstone

FIG. 3.—TEMPERATURE COIL CONNECTIONS.

bridge. The resistances in the other legs of this bridge are constant and the voltmeter across the bridge is calibrated so that the temperature can be read directly. Thus armature temperatures can be watched and overheating detected.—*Elec. Railway Journal*, Vol. 50, No. 15.

PARLIAMENTARY.

THE *London Gazette* for November 23rd contains official notices concerning the following applications to Parliament and the B. of T. for powers relating to electrical schemes:—

London United Tramways, Ltd.—Various powers, including postponement of date of compulsory purchase of tramways and light railways, increase of fares, abandonment of parts of undertaking, provisions as to supply of energy by the Metropolitan District and London Electric Railway Companies, and as to supply of energy to Kingston Corporation, &c.

County of London Electric Supply Co., Ltd.—Power to pay interest out of capital, to extend time for purchase, &c., of lands at Barking for generating station, and provisions re residual products, by-products, &c.

Rotherham Corporation.—Transfer of electricity undertakings of Mexborough and Swinton Tramways Co. in Rawmarsh and Swinton; extension of area to include Greasborough, Rotherham rural district, and Wortley; acquisition of neighbouring electricity undertakings; supply in bulk; construction of wharf on the Don, and a dam across it; purchase of coke oven and crude gas and heat, &c.

Pontypool Gas and Water Co.—Many provisions, including acquisition of Pontypool Electric Light and Power Co., Ltd.

Gloucestershire Electric Power Co.—Acquisition of lands, construction of generating stations, manufacture of gas and residual products, extension of time under 1902 Act, and enlargement of powers, &c.

Bristol Corporation.—Extension of electric supply area.

South Suburban Gas Co.—Agreements and arrangements with local authorities, companies, &c., with reference to electrical undertakings, supply of energy in bulk, or for heat or power.

Aldershot Gas, Water, and District Lighting Co.—Extension of areas of supply for gas and electricity.

Braintree U.D.C.—Provisional Order for electricity supply.

Stocksbridge U.D.C.—Provisional Order for electricity supply.

Wortley.—Electric Distribution of Yorkshire, Ltd.—Provisional Order for Bradfield, Ecclesfield, and Tankersley.

Leeds.—U.D.C. Provisional Order for electric supply.

Halifax.—Corporation electric supply in Luddenden Foot and Mytholmroyd urban districts.

(To be continued.)

Water Power in Morocco.—In a recent number of *La Nature*, M. Laurent Rigotard discusses the question of utilising the hydraulic resources of Morocco in the economic development of the country. The country has considerable potential water powers which only await utilisation on a large scale. Up to the present, however, it is only in the neighbourhood of Fez that water power has been applied. The writer suggests the granting of concessions of waterfalls of 20,000 to 30,000 h.p. at least, supplying high-tension networks of, say, 50-cycle, three-phase current at 60,000 volts. Many people have objected that Morocco could not possibly utilise this amount of energy, but the writer mentions a steam station established at Casablanca which is already insufficient for port operations and the lighting of the town. He thinks that ten times this power could be easily absorbed for private lighting and power purposes, provided the supply were reasonably cheap. Further, any station prepared for taking five or six groups of turbo-alternators of 5,000 h.p. each could be started running with two groups only, the remainder being installed according to requirements. The writer is also of opinion that the railways could be electrified with advantage.

THE INSTITUTION OF ELECTRICAL ENGINEERS.

Abstract of the Inaugural Address delivered by
MR. C. H. WORDINGHAM, President, November 8th, 1917.
(Concluded from page 502.)

Perhaps the most potent influence in directing the movement changes into the proper channel, as well as in assisting us in our competition with other nations, is education. In the past a large section of the British public has been obsessed in the most extraordinary fashion with the idea of German superiority in science and engineering. I deny this superiority *in toto*; I believe that British scientific men have been in the van of progress from the dawn of science, and that British engineers and manufacturers have led the way, and have only been hampered by the unfair commercial methods of their rivals and by the mistakes that have been made by their own countrymen in regard to matters which cannot properly be touched upon in an address of this character.

A strong agitation has been promoted to elevate science to a pinnacle, and to make it the be-all and end-all of education and existence. Are we so very greatly impressed with the results upon the German nation of the cultivation of science to the exclusion of other human activities? No more powerful argument than this war could be adduced by the enemies of science in favour of those older methods of education which in some directions have no doubt been open to criticism. Let us while giving to science the high position that is its due, keep it in its proper place, and not imagine that it can be a substitute for those moral and religious principles which alone can afford adequate or worthy motives for human action or give courage to fight and persevere, and ultimately to conquer, in a righteous cause.

Engineering and scientific training are absolutely essential to an industrial nation, but it must never be forgotten that they provide but the tools which must be as perfect of their kind as they can be, and without which no work can be done, but it is the human, mental, and moral qualities of the nation which will decide the issue in the world competition.

When the war is over manufacturers will be faced with the need for reorganising for the production of articles of peaceful commerce. It is clear that there will be facilities for production greatly in excess of those existing before the war, and every effort will have to be made to find markets of sufficient magnitude to absorb the output necessary for a profitable return on the capital invested. The capture of the foreign trade required will be greatly facilitated by the retention of the home market in British hands, and it is to be hoped that this will be realised in the proper quarters, and that legislation will be on statesmanlike lines.

POWER SUPPLY.

One of the most pressing and important home problems is the provision of a cheap supply in adequate quantities in all parts of the country of electrical energy for motive power, for furnace work and electrochemical industries, and for factory and other lighting. The matter has fortunately received the attention of the Government, and committees with expert knowledge have been appointed to inquire into and advise on it. If we had to begin now, not only with our present knowledge and facilities, but also, and let me emphasise this, with the present demand and state of public knowledge and opinion of electrical appliances, we should put down a relatively small number of large stations in positions chosen for their facilities for economical generation, all working on an identical system, and suitably interconnected.

But we are not starting now, and those of us who have been engaged in the business of electric supply from the earliest days know full well how arduous has been the task, and how heavy the cost of gaining the knowledge that is now the common possession of the industry. Any scheme which is brought forward cannot, in common justice, ignore the claims of those who are now carrying on the business which they have built up by their capital, by their work, and by their skill. Due provision must be made for the gradual wiping off of the existing capital, and adequate compensation must be given to those displaced, whose lives have been devoted to what they had every right to expect would be a lifelong business.

The objects in view will best be attained by developing what is good in existing systems and eliminating what is bad, rather than by attempting to supersede all that has been done suddenly and abruptly.

There are a number of existing stations in which the generating units are large and well-nigh as efficient as any that can be devised at the present day, and which are well situated for economical working. Let these be linked up to adjacent stations, and let them be worked to their utmost, in some instances being extended, and let the smaller gradually be eliminated, the worst being shut down at once, and the others worked in such a way as to contribute what they can efficiently to the general supply until the cost of their plant is wiped out. It may quite possibly be more economical to work inefficient plant already in existence to provide stand-by supply than to purchase new and more efficient plant for the purpose. Side by side with this development let new stations

on ideal lines be erected to supplement the old, which in due course they will supplant.

We must again have co-operation and co-ordination of existing concerns. However powerfully supported any new scheme may be, it cannot be denied that the vested interests in existence are very strong, and it must render progress much more rapid and tend to secure much earlier realisation of ideal conditions if the opposition of such vested interests is disarmed and their assistance even obtained.

ECONOMY OF FUEL.

Closely connected with the problem of power supply is that of national economy of fuel. There is a tendency to confuse economy of fuel with cheap power supply, but the two are quite distinct, though closely connected. In regard to these matters, electrical engineers have been apt to arrogate to themselves too prominent a position. It is little short of ludicrous to ignore the great gas industry, either in respect of their consumption of coal or of the experience of their engineers and managers. While for motive power and lighting, and for certain kinds of furnace work, electrical operation is pre-eminent, and will almost certainly in the fullness of time be universal, there will still be an immense field for heating by gas. Apart from this, however, I hold most strongly that gas production will be an intermediary between the raw fuel and the live steam, and so be concerned in the generation of the whole of the electrical energy used. I have for many years advocated the close co-operation, if not the fusion, of gas and electric interests, and I believe an appreciation of the soundness of this view is gaining ground.

The whole of the coal raised should be treated as near the pit as practicable for the extraction of those substances usually referred to by the generic name of by-products, and for the production of a fuel, whether solid, liquid, or gaseous, or one or more combined, which can be conveniently used for the direct production of steam. At this point the electrical engineer should take the matter in hand, and produce his steam and conduct the other operations necessary to provide the electrical energy for transmission at high pressure to the distributing centres.

I do not think the proposal which has been made is sound to draw the dividing line later, and let the gas works supply the steam. Electrical engineers have made the production and utilisation of steam their own field, and they are pre-eminently expert in it, while gas engineers have not been called upon to consider this problem to any great extent, nor under the conditions imposed by a generating station. Moreover, I think there would be practical operating objections to this line of demarcation.

In the new circumstances, it is obvious that the sites of generating stations will be determined in future solely by the facilities for carrying on the operations named, and will be uninfluenced to any material extent by their proximity to centres of demand. The only way in which the interests of fuel economy and efficient distribution can be reconciled is by the use of extremely high pressures of transmission, and by other means for the reduction of the cost of mains; even so, it may well be that the cheapest, as distinguished from the most efficient, supply of a given quantity of energy at a given point may not be realised, although on the whole the most economical use of the fuel will have been made.

The problem of the production of heat in detail to supply a distributed demand for warming buildings and for cooking purposes will require careful study. The present crude methods are cheap, simple, and to a large extent convenient, but they are criminally inefficient.

Electric cooking will probably be very largely used on account of its intrinsic merits; with increased demand we may look forward to robustly designed simple appliances that can be handled without damage by the ordinary domestic servant, and that will be sold at prices comparable with those of the articles displaced. Electric heating of rooms will also have a large field in those cases in which convenience is an overwhelming consideration, such as in rooms used occasionally or for a few hours a day. I do not believe that electric heating will be employed for steady, all-day heating, or for boiling the large quantities of water required for domestic and trade purposes, because it will never be cheap or economical to do so. This heating will probably be done to a large extent in the smaller houses by gas or by some solid fuel produced in the gasification of coal. In large establishments, blocks of offices, factories, and all large buildings some form of central heating, in which the heat is produced by solid fuel of the kind I have indicated, or possibly by liquid fuel, will probably be introduced on the grounds of cheapness and economy, though certainly not of comfort or health.

Our practice in distribution is undergoing development in consequence of the increase in the amount of power to be conveyed. In all probability there will be a double system of high and low-pressure distribution, large consumers of power being connected to the high, and domestic and shop requirements being provided from the low.

The developments in store promise to be of the greatest interest, and will bring back the earlier days of electric supply when new problems, which had to be met one way or the other, were arising every day, and they will lift central-station work out of the dull routine into which it seemed likely to settle down.

ELECTRICAL ENGINEERS.

There is a tendency at the present time to regard manufacturing as synonymous with electrical engineering, and to disregard the other branches of the latter, more especially to belittle the consulting engineer, many going so far as to say that he will shortly disappear. I think it would be a distinct loss to the profession were the consulting engineer to be eliminated and his work taken over by the manufacturer. From the manufacturer's point of view, it is clearly advantageous to have someone who can state the purchaser's requirements in a definite manner in terms that can be understood without ambiguity, so that all tenders are on an equal footing, and who is able to appreciate the relative values of the offers firms make irrespective of the persuasive powers of their representatives. From the purchaser's standpoint, the consultant necessarily takes a broader view, and his advice is likely to be more reliable than that of any individual firm of manufacturers who, however honest in intention, must necessarily be biased in favour of their own methods of attacking a problem, and who will be tied largely to their own designs, which may not be uniformly the best. In my experience, also, the consultant is often able materially to assist manufacturers by putting before them the needs of users that they would never have thought of, and by defining precisely the conditions to be fulfilled in a manner that the user never could on account of his not possessing the necessary technical knowledge to enable him to do so.

I venture to think that all parties would benefit by a stricter etiquette than now exists. Manufacturers should support the consultant in the same way that the general practitioner does the Harley Street specialist, or the solicitor the King's Counsel, instead of providing advice gratis and ousting the consultant. On the other hand, the consultant (as all the leading men do) should confine himself strictly to occupying an advisory position without interest, however remote, in any manufacturing concern, and abstain from indulging in his own fads, a practice that has greatly irritated manufacturers and contributed largely to the present situation.

A reform greatly needed in connection with engineering concerns is the appointment of men of high technical qualifications, instead of clerks, to the position of manager or secretary. It is monstrous that engineers should undergo a lengthy and arduous training, and provide the skill, inventiveness, and high qualities necessary for the efficient management of men, to find themselves in receipt of rewards only a fraction of those bestowed on an individual whose attainments are purely clerical, and who has it in his power to mar their efforts, and to whom they must to a large extent be subservient. It is absurd to argue that the engineer often has no business capacity; if he has any real claim to be called an engineer he must possess commercial ability, for it is this very attribute which distinguishes him from the man of pure science; he has got to make his designs pay. There is no training so calculated to cultivate the intellect and to broaden a man's outlook as engineering, and an engineer will grasp business problems infinitely better than a clerk. An engineering undertaking should be managed by an engineer; engineers have the power to ensure this entirely in their own hands; they are absolutely indispensable, and if properly organised can secure their proper position in commercial undertakings.

It is a matter for surprise that engineers should count for so little in the public eye. They have let others occupy the prominent positions that are theirs by right, those positions which bring them most into contact with their non-engineering fellow-men, and have perhaps been apt to look with contempt on popular appreciation and on the shifts of notoriety seekers. Unquestionably the public has had brought home to it the resourcefulness and widespread power of the engineer, and a large number of people have acquired a smattering of engineering which, however small, must tend to increase respect for our profession. The time, therefore, seems ripe for a change.

We ought to start and maintain an organisation that shall ensure that the technically trained material in the country shall be applied with maximum effect immediately war breaks out, and avoid the lamentable waste that has occurred in the present war by disregarding the technical qualifications of many, and by giving others technical work for which their training has been unsuited. Not only should all individual engineers be classified according to a well thought-out scheme, but actual posts in a war organisation should be assigned to them. Similarly, all factories should be organised so that each would in war-time contribute a definite product in definite quantities when the war need arose.

A word as to engineering as a profession; it surely, rightly apprehended, is one of the most ennobling. It requires an active brain, making, as it does, a direct appeal to the intellect, and it brings a man into intimate contact with the laws and processes of Nature, and their everlasting truths, while constructive work is the nearest approach to creation possible to a created being.

I would particularly impress on the young engineer the need for thoroughness in all he does—"Whatsoever thy hand findeth to do, do it with thy might" is a maxim applying with peculiar force to engineering. Strive after perfection, and do not regard the smallest job as unworthy of your best efforts. Let love of your work for the work's sake be your

dominant motive, and do not aim lower than perfection, even though absolute perfection may be unobtainable; believe me, the more material benefits will be added to you.

On Thursday next the Institution of Electrical Engineers will meet to discuss the metric system, not from the point of view of its merits in comparison with our existing systems, or want of system, but with regard to the difficulties which may be experienced in putting it in operation in the British Empire. Its advantages have been fully demonstrated, not only in the theatre, but also in the workshop, and the Institution, through its Council, has definitely recommended the Board of Trade to hasten its introduction as a compulsory measure; now it is proposed to consider its disadvantages and the best means to overcome them, and we commend the wisdom of this course.

Not even the most zealous advocates of the metric system will pretend for one moment that there are no difficulties to be faced or problems to be solved in carrying out so important and far-reaching a reform; undoubtedly there are some very serious obstacles to its adoption—but none which cannot be negotiated successfully. We take the opportunity to suggest that the question should be approached not with a mandatory attitude of mind, but with the spirit of conciliation, co-operation, and good fellowship, and that every endeavour be made to find satisfactory means of removing or mitigating the objections that will inevitably be raised in various quarters. The public welfare is the consideration which energises us who advocate the compulsory adoption of the metric system, and we most earnestly desire that no man shall suffer in any way from the effects of the change. But equally we trust that even those who firmly believe that it would adversely affect their own interests, will take the broad view and endeavour impartially to judge whether the nation as a whole would benefit by it, and if so, that they also will consider how best their own difficulties can be tackled and minimised, instead of utilising them as obstacles to thrust in the way of the proposed change of system.

The matter is of such great importance to our commercial and industrial future that we hope the speakers in the discussion will not be confined mainly to London residents, but will include many provincial works managers and others who are directly interested in the subject, whether for or against the change: the metrists do not wish to turn a blind eye or a deaf ear to objections—they wish to have the real objections tabled before them, and to join in friendly discussion regarding them. By "real" objections we mean not theoretical or sentimental considerations but actual practical points such as the question of standards, the conversion of weighing machines and instruments such as gas meters, the supply of merchant rods and bars to metric measures, &c. We know that practical experience on such questions has already been gained, for many of our engineering workshops have for a long time used metric weights and measures more or less extensively—and, incidentally, we may add that they have overcome any difficulties arising from internal sources.

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE:—4, LUDGATE HILL, LONDON, E.C. 4.

Telegraphic Address: "AGEEKAY, LONDON." Code, A B C.

Telephone Nos.: City 997; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, £1 1s. 6d.; Canada, £1 8s. 10d. (\$5.80). To all other countries, £1 10s.

ELECTRICAL & ALLIED TRADES DIRECTORY

(THE RED BOOK),

1917 EDITION.

H. ALABASTER, GATEHOUSE & KEMPE,
4, Ludgate Hill, London, E.C. 4.

We look forward to a highly interesting and useful discussion, free from digressions involving the "Belgic yard," attempts to modify our existing units, or other obvious futilities, and we should be glad to see a committee appointed for the purpose of collecting and tabulating particulars of all *bona-fide* difficulties with a view to devising ways and means for overcoming them at the minimum of expense and inconvenience.

The question now is not so much *whether* we shall adopt the metric system, as *how* and *when* we shall adopt it; and whether we shall give a lead to the United States in this important matter, or wait—and see ourselves compelled to follow in its footsteps. Against the cost of establishing the system must be set the cost of going on as we are—not only now, but in the strenuous days that are coming—heavily handicapped in our relations with foreign customers and with foreign manufacturers, and in our internal organisation to a degree second only to the former.

It is to be hoped that works managers and others who have had actual experience of the use of the metric system in their workshops, and in their export trade, will come forward and give the results of their experience; for there is no test to compare with the practical test, and certainly no argument so convincing as the irrefutable "I have tried it myself, and *know* that it is good." In this connection we have found it interesting to turn over the replies received to our circular inquiry of September, 1915, when a verdict in favour of the metric system was returned by the handsome majority of four to one; of the many firms that were using the metric system in their shops, a large proportion were enthusiastic advocates of its general adoption, and not one reported any special difficulty in applying it. Further, of those who dissented from its compulsory introduction, not one stated that he had tried it unsuccessfully. We are inclined to believe, as the result of this and other evidence, that the difficulties which bulk so large in the distance are found to melt away when the matter is grappled with at close quarters. In all our reading of the arguments of anti-metric writers, we do not recollect a single instance of difficulty in teaching the workmen to use metric units—they are so simple that anyone who can read an English scale can use a metric scale with greater ease.

One of the commonest mistakes in dealing with this subject is the assumption, quite groundless, that English units cannot be converted into metric without the use of several places of decimals. We went to considerable trouble in 1915 to show beyond cavil that, as the millimetre is a much smaller unit than the inch, drawings figured to the nearest millimetre could not be more than 20 mils in error; if figured to the tenth of a millimetre, the error was less than 2 mils, which is about the average error of measurement met with in the workshop; and if figured to the hundredth of a millimetre, the error (less than 2/10 mil) could only be distinguished by refined methods of measurement such as are rarely employed in the workshop. Jigs and gauges need no alteration whatever. Moreover, it is seldom possible to arrange for more than a very few of the dimensions of a metal part to be simple figures in inch measurements, and there is, therefore, no reason to cavil at a corresponding inability in the case of the metric system (though, owing to the inch containing 25 mm., integral mm. dimensions should occur about 25 times as frequently).

Many other arguments were advanced by our correspondents and by ourselves in our long series of articles on this subject, which will be found in our issues of October 15th to November 26th, 1915, and in that of March 23rd, 1917, together with evidence derived from actual workshop experience in various countries.

We recently read in our American namesake that

as a result of war orders, factories all over the United States were working to metric measurements, and thousands of workmen were becoming familiar with the centimetre and the gramme. The validity of the argument that the adoption of the metric system involved serious difficulties in the adaptation of mechanical appliances to a different scale had been quite destroyed by the comparative ease with which adjustments were made to suit the new conditions, and our contemporary urged that "right now" the metric system should be made the national as well as the international language of commerce and industry. We think so, too.

Water Power in Sweden.

THE Year-book for 1916 of the Swedish Chamber of Commerce for the United Kingdom contains an interesting article on the Svenska Vattenkraftforeningen, or Swedish Water-Power Association, the aims of which are to promote the national economic utilisation of the water-power resources of Sweden, and especially to attain a precise knowledge of the country's resources in available water power, to ascertain the best means of turning such resources to account from a technical and economic point of view, to promote and assist schemes for the conservation and regulation of lakes and rivers, and, generally, to apply the experience gained both in Sweden and abroad in the solution of such questions.

The utilisation of the abundant water power of Sweden has from year to year become of greater importance as a lever in the extension of its industry and development. Until, however, the Association was formed, towards the end of 1909, there was no uniformity in the methods adopted for dealing with the problem. One great drawback experienced was the over-rating of the water power as a direct source of income and subject for taxation, while another was a movement towards limiting the rights of strandowners to the disposal of the water, under cover of which the water-power utilisation industry had up to then been developed.

Since its establishment, the Association has had numerous opportunities for activity, among the matters dealt with having been the following: Proposals to the Riksdag, or Swedish Parliament, for the administration of certain waterfalls belonging to the State; for a law regarding waterfall rights; for ensuring the fulfilment of contracts for the delivery of electric power; for the introduction of concession laws relating to waterfalls and power stations; and, finally, the framing of a new water-right law.

To increase the knowledge of the water power in Sweden, the Association has compiled comprehensive statistics, and has issued special survey maps based thereon. It has also arranged water-power exhibitions, where the Swedish water-power technicalities and the progress of the Swedish water-power industry have been illustrated by numerous collections of drawings, photographs, statistical tables, &c. In recent years, the Association, which now comprises 260 private members, 100 commercial undertakings, 12 societies and other corporations, and six foreign societies and corresponding members, has specially endeavoured to prepare for an increased consumption of water power, with the view of lessening Sweden's dependence on fuel from abroad. By means of its information department, the Association publishes, as occasion arises, a series of pamphlets, about 80 having up to the present been issued. Lectures are also given and papers read before technical societies, chambers of commerce, &c., in the country with the view of disseminating information regarding water power and its utilisation.

MODERN ARC LAMPS AND INCANDESCENT LAMPS.

EVER since the "half-watt," gas-filled tungsten filament lamp was first placed on the market, it has been a subject of discussion to what extent the filament lamp could economically replace the arc lamp. Many writers have asserted that one lamp or the other would ultimately attain to virtual supremacy, but we have maintained consistently that there is, and will always be, a field of application for both types. This view is supported by a comparative study due to Heyck* (chief engineer to Körting & Mathiesen). The author's attitude appears to be impartial, and he gives many data hitherto available only in scattered form, if at all.

Special types of arc lamp, such as those used for projection, reproduction or copying processes, "daylight" lamps, and searchlight arcs, are in a practically unassailable position. On the other hand, arc lamps burning plain carbons and small enclosed arc lamps are practically obsolete for general lighting purposes. The types of arc lamp concerning the prospects of which, in competition with high-power filament lamps, it is most difficult to reach a decision, are open lamps burning impregnated carbons mounted side by side, and enclosed lamps burning impregnated carbons mounted one above the other. Considerations which have practically established the supremacy of half-watt lamps over the smaller and less efficient types of arc lamp are: The lower first cost of the filament lamp; the simpler installation and maintenance of the latter; the steady "white" light given by the filament lamp and the fact that the latter can be used singly (not in series connection) even where a comparatively small lighting unit is required and the supply voltage is high. Also a filament lamp of higher or lower candle-power can be substituted easily for another; this practice may easily be abused, but it is often very convenient. Some forms of arc lamp give a better approximation to white light than the tungsten lamp, but none can claim equal steadiness of lighting, and the difference in colour is not often a determinative factor.

The arc lamp burning plain carbons costs more than the tungsten filament lamp both in direct and indirect working costs. The cost of carbons has to be set against the cost of bulb replacements, and the efficiency of the half-watt lamp compares favourably with that of the ordinary plain carbon arc, or that of the long-hour enclosed arc. When used in a suitable fitting the "half-watt" lamp consumes 0.55 to 0.9 watt per c.p.† This may be compared with 0.68 to 1.0 watt per c.p. for D.C. plain carbon arc lamps of the open type used two in series on 110-volt supply; or with 0.57 to 0.73 watt per c.p. for similar lamps used three in series on 110-volt supply. Enclosed arcs with plain carbons consume 0.8 to 1.1 watt per c.p. if used singly on 110 volts; and from 0.7 to 0.8 watt per c.p. if used three in series on 220 volts.

Plain carbon arc lamps can only be considered for indoor lighting purposes at the present day (the flame arc holding the field for external arc lighting) and in indoor illumination the power expenditure per foot-candle per square foot of floor area is a more important factor than the watts per candle-power. On the basis of watts per foot-candle per square foot, the half-watt lamp compares very favourably with the plain carbon arc, whether for direct, semi-direct or indirect lighting. For purposes of comparison, the data in Table I are useful, these being averages for a room 33 x 20 ft., with white ceiling, white frieze and grey walls. The arc lamps are supposed to be provided with opal globes, and the data for half-watt lamps assume a 300-watt lamp with an opal globe for direct lighting and "Kandem" fittings for semi-direct and indirect lighting:—

TABLE I. AVERAGE WATTS PER CANDLE-FOOT PER SQUARE FOOT OF FLOOR.

Type of lamp.	Watts per candle foot per square foot (or per candle metre per square metre).		
	Direct lighting.	Semi-direct lighting.	Indirect lighting.
Plain carbon arc: open type.			
D.C.: two in series on 110 v....	0.17	0.23	0.18*
D.C.: three in series on 110 v....	0.11	0.16	0.25
A.C.: connections not stated...	0.25	0.27	0.36
Plain carbon arc: enclosed type.			
D.C.: singly on 110 v....	0.20	0.30	
D.C.: three in series on 220 v....	0.11	0.23	
Half-watt lamp (300 watts) ...	0.12†	0.11	0.11

* Burning with positive carbon beneath; only practicable with two lamps in series and not with enclosed arcs. † Opal globe.

The data in Table I indicate, on the basis which is of primary importance in lighting interiors, a surprising economy in the gas-filled tungsten filament lamp, particularly in semi-direct lighting. The fact that *semi-direct lighting is cheaper than direct lighting* (or, for practical purposes, equally cheap) where half-watt lamps are used and

FIG. 1. FIG. 2. FIG. 3. FIG. 4.

the ceiling is white, is due to the fact that this type of lamp emits practically equal quantities of light upwards and downwards. Fig. 1 shows a typical candle-power curve for a bare 500-watt half-watt lamp of 695 m.s.c.p.: 660 m.b.-s.c.p. (upper); and 730 m.b.-s.c.p. (lower). The cap of the lamp offers a certain obstruction to up-going light. The remainder of the latter, when the lamp is used in an opal globe for direct lighting, is reflected downwards by a shade with an efficiency of reflection of 50 to 60 per cent. Generally, light so reflected has still to pass through the opal globe, and is thereby weakened another 15 to 25 per cent., so that only 40 to 50 per cent. of the light sent out by the lamp above the horizontal is available for downwards illumination. On the other hand, light going upwards from a semi-direct fitting is reflected downwards by a white ceiling with practically the same loss as is occasioned by the enamelled shade of a direct lighting fitting, but after reflection from the ceiling, light is subject to no globe loss, hence semi-direct lighting (using globe lamps) is as efficient as, or even a little more efficient, than direct lighting. The lower efficiency of indirect lighting is due to light originally sent downwards having to submit to double reflection (from the fitting and from the ceiling) before it proceeds to the working plane. It will be seen, however, from Table I, that indirect lighting is only about 20 per cent. dearer than direct lighting and 30 per cent. dearer than semi-direct lighting; it is *not* twice as dear as direct lighting.* Figs. 2—4 show typical polar curves of candle-power for direct, semi-direct, and indirect lighting units using half-watt lamps.

Semi-direct lighting has become very popular during the past few years, and obviously not without sound justification, in respect of high efficiency. Lest it should be objected that everything depends on the ceiling being cleaner than it can be kept in practice, it may be noted that

* Table I assumes equal illumination in each case, but it is generally necessary to provide higher mean illumination with indirect lighting than is needed when there is a high percentage of direct illumination. This necessity makes indirect lighting relatively more costly than indicated by Table I.—[Eps.].

* Zeitschrift des Vereines Deutscher Ingenieure.
† Here and hereafter reference is to mean lower hemispherical British candle-power, unless otherwise stated.

the figures in Table 1 are based on tests made beneath a ceiling which had not been whitewashed for five years. Electric lamps themselves do not soil the ceiling, and in living rooms, offices, and workshops, where no very dirty work is performed, it is sufficient to whitewash ceilings every two years in order to maintain the efficiency of semi-direct or indirect lighting. It is much more important that the lamp bulb and reflecting surfaces of the fitting be kept clean: due to the brisk local circulation of air maintained by the heat of the lamp, dust accumulates fairly rapidly on these parts, and to prevent its becoming "burnt on," and causing great loss of light, the lamp and fittings should be cleaned regularly (generally at intervals not exceeding one month).

A point which is not unimportant in interior work is that glow lamp fittings can be varied to a far greater extent than are lamps, in order to harmonise with architecture and decorations.

(To be continued.)

THE EDUCATION AND TRAINING OF ENGINEERS.

By "RADIX."

(Continued from page 508.)

The attempts of Labour to coerce payment on the highest possible scale by taking advantage of the necessities of Capital, and the efforts of Capital to grind as much as possible out of Labour without regard to the fact that the labourer is a human being, have resulted in measures being adopted by both sides which "kill the goose that lays the golden eggs." The canker of individualism has eaten into our whole social system.

A skilful dialectician may, no doubt, be able to make out a case for individualism, but in the long run the man who seeks to grind his own axe only, ends either by cutting himself badly, or by falling a victim to the natural feelings of rancour aroused in those who have suffered by his inconsiderate egotism.

Is it not the fact that nowadays the majority of us are more concerned with our legal than with our moral position? Is it not general experience that if a man is honest, it is—more often than not—because he is too great a fool to be anything else? Do we not find that the number of business men who "understand legal liability and limited liability, but know nothing of moral liability," is increasing? Is not everyone familiar with the aphorism "truth is sometimes met with in this world, even in an affidavit"? And does not one's personal experience of affidavits show that there is solid foundation in fact for this seemingly cynical utterance?

Trade Unions have introduced rules and regulations which tend to create in the minds of members (and particularly young members) the habit of thinking only of their rights and privileges, and ignoring the fact that duties and responsibilities are necessary concomitants of rights and privileges—in other words, to destroy instead of to preserve the "nice equilibrium between the subjective and the objective faculties." That a journeyman mechanic should receive the same rate of pay whether he be a highly skilled man with 20 years' experience or whether he be an apprentice just out of his time is a manifest absurdity, and tends to kill all desire to excel. On the other hand, the principle adopted by some employers to "overload the willing horse and say nothing" is equally pernicious. In either case the mechanic is deprived of any stimulus to take pride in his work, or to improve in his art. The standard of skill is lowered, and the factor of conscientiousness dwindles towards zero. This reacts

upon the productivity of the nation, and constitutes a serious handicap in national progress.

The word "bargain" has come to mean an exchange in which one party obtains an undue advantage. In the original sense of the word, the essence of a bargain was that each party rendered to the other a just equivalent. Were this principle more rigidly observed it is safe to say that nine-tenths of the sources of dispute between Capital and Labour would disappear.

Trace any human action back to its source and we finally come to an act of volition. In fact, we have no experience of any cause but Will.*

Leaving on one side any metaphysical speculations as to the origin or function of Will, we are face to face with the indisputable fact that in the ultimate analysis the action of a man placed in supreme authority is controlled, humanly speaking, by nothing but his Will. Is it not the fact that, so far as human beings generally are concerned, "goodness" or "badness" is a function of ability to resist temptation? Do not the numerous cases of misappropriation of trust funds by men who enjoyed the highest reputations for honesty and integrity bear this out? What is there to impel a man to do right simply because it is right, except the possession of an invincible moral sense? And is the inculcation of the imperative necessity of observing the moral law accomplished by the training of the rational faculty alone, be it in the direction of scientific research or of mechanical skill? We surely do not need any more convincing object-lesson in the futility of any attempt to base the moral law upon reason only, than is found in the inverted moral sense of the German Empire of to-day, as exhibited in the utterances of their leaders of thought and in their methods in warfare.†

During the discussion at the meeting, Mr. Berri-man made a point of the great advantage that would accrue from the cultivation of relations of friendship between masters and men; Prof. Dalby said something to the same effect; Mr. Longridge caused a gasp of amazement by the use of the word "religious" in his speech; Sir John Wolfe Barry insisted upon the necessity of raising the moral tone; Mr. Hadow said that "we needed not only skilled men, but good men."

All very true, but this will not be accomplished if reform in the education and training of engineers is confined to means for raising the standard of skill and for imparting a knowledge of theory. The attainment of a high degree of mechanical skill will not impel a mechanic to give a fair day's work for a fair day's pay, nor will the possession of an engineering degree impel an employer to pay a fair day's wage for a fair day's work. Education (or

* "It seems absurd one white man sitting in the house of the King of hundreds of thousands of subjects and dictating, and not only that, but being attended to and obeyed. And this is the power the white man has, what it is I can't say, but whatever it may be, it is that power, and not all the black troops we may raise, that enables us to stay in the country. It is a very curious thing to think over, but here we hold this vast country (and it is the same, of course, all the world over) simply by Will power or whatever it may be termed; by nothing else, for the natives could rise up and drive every white man into the sea to-morrow if they wished." —(Extract from a letter written at Ilorin, Nigeria, by David Wymford Carnegie.)

† In this connection, the words of Cardinal Manning, written about 40 years ago, are worth recalling:—"A fatal extinction of supernatural light, the aberration of false philosophy, the inflation of false science, the pride of unbelief, and a contemptuous scorn of those who believe, are preparing Germany for an overthrow or for suicide."

The event has shown these words to have been prophetic. In the September issue of the "Nineteenth Century and After," Mr. Ellis Barker, a well-known writer on Germany and the Germans, concludes an essay, entitled "How Education has Degraded the German Character," with these words:—"Education, far from enlightening the German nation, has blinded, debased, and dehumanised it."

what passes for such to-day) and morality are not correlatives. "The belief in the moralising effects of intellectual culture, flatly contradicted by facts," says Herbert Spencer, "is absurd *a priori* . . . One who should by lessons in Latin hope to give a knowledge of geometry would be thought fit for an asylum; and yet he would be scarcely more irrational than are those who by discipline of the intellectual faculties expect to produce better feelings." (Study of Sociology, Chap. VIII, p. 363.)

It may be said that all this is not the business of the Committee it is proposed to appoint. Possibly not—directly. But it has got to be somebody's business because just as "the modern world has recently learned that it is useless to try to educate a child that is not fed," so it will prove useless to try and turn out "good men as well as skilled men" unless the men possess the potentiality of goodness as well as of skill. You cannot make a silk purse out of a sow's ear.

The evils from which humanity is suffering to-day are largely traceable to the persistent neglect, throughout generations, of the training and development of Will and character in the young. At present the moral training of our children, our young men, and young women, gives some of us rather less concern than the selection of our daily food.

(To be continued).

PYROMETERS AND PYROMETRY.

THE Faraday Society opened their session on November 7th, meeting in the rooms of the Royal Society of Arts, when a large gathering contributed to the success of the general discussion on "Pyrometers and Pyrometry," which filled—and more than filled—the evening's programme. Owing to the regretted absence of the President, Sir Robert Hadfield, to whose initiative the discussion was due, the chair was filled, appropriately enough, by Sir RICHARD GLAZE BROOK, C.B., F.R.S., Past-President, the Director of the National Physical Laboratory, where so much valuable work on heat and its measurement has been carried out almost since its foundation. This early work was referred to by the Director in the interesting contribution to the discussion with which he opened the proceedings. In those early days the old Kew thermometer represented the national means of measuring temperature, and it was due to Sir Andrew Noble that Dr. Harker was able to begin the investigation of the relation between the air thermometer and Callendar's platinum resistance thermometer. It was not until 1913 that the standardisation of higher temperatures was attempted, and this aspect of the subject was dealt with by Dr. EZER GRIFFITHS and Mr. F. H. SCHOFIELD. It had been arranged to hold a conference at Berlin in September, 1914, to introduce an international scale of high temperature, up to and possibly beyond 1,300 deg. C., but under the circumstances an agreement between the Washington Bureau of Standards and the National Physical Laboratory was all that had been reached. Sir Richard gave some striking illustrations of the importance of exact high temperature measurements to modern industry. It was found, for example, that in a particular heat treatment process 40 or 50 per cent. of the steel articles had to be rejected, because the temperature of quenching had only been judged by the skill of an experienced workman instead of measured by a pyrometer.

Pyrometer Standardisation.—The paper by Griffiths and Schofield already referred to gave an account of methods at present in use at the National Physical Laboratory. The standard scale of temperature is thermodynamic, but in practice the problem of standardisation resolves itself into an empirical calibration of the pyrometer against a gas thermometer, but the comparison not being always a direct one takes place through the following stages:—

1. Comparison of gas thermometer with a thermoelement.
2. This thermoelement is employed to determine the freezing points of a number of pure metals.
3. The freezing-point determinations are used by the observer who wishes to calibrate a pyrometer for the standardisation of his thermoelement, who then compares the pyrometer and thermoelement under suitable conditions.

In practice the constant-volume hydrogen thermometer is used to realise the scale between 0 deg. C. and 100 deg. C., and calibrated against this, but extending over the range between the freezing point of mercury (38.88 deg. C.) and the boiling point of sulphur (444.5 deg. C.), the platinum resist-

ance thermometer is employed. The paper proceeds to give the best determinations now available of the fixed points on the thermometer scale up to the melting point of copper (1,083 deg. C.). Above this temperature few investigations have been made with the gas thermometer, but Day and Sosman, using a rhodium-alloy bulb, have arrived at 1,549 deg. C. as the melting point of palladium, and by extrapolation 1,755 deg. C. as that of platinum. Up to 1,550 deg. Day and Sosman's "fixed points" are usually accepted as standards, but above that temperature the scale should be extended on the basis of the radiation laws.

Mr. JOHN RHODIN, in the discussion, raised the interesting point as to whether it would not be better to base the whole of our thermometric scale on the laws of radiation, which have a sound theoretical basis. Messrs. Griffiths and Schofield went on to describe the apparatus employed for calibrating the thermometric pyrometer by means of the accepted "fixed points," and they discussed in some detail the sources of error to be looked for and avoided. Finally the calibration of total radiation and optical pyrometers was dealt with, the electric furnaces used for the purpose, an example of which was exhibited at the meeting, also being briefly described.

Recent Developments in Pyrometric Apparatus.—Of the group of papers describing recent forms of pyrometers and of apparatus for obtaining high temperatures, the most interesting were contributed from America. That sent by Dr. E. F. NORTHRUP was particularly illuminating and suggestive. After pointing out the objections to existing types of electric furnaces, particularly those used for fusing chemically-pure products requiring very high temperatures, he laid down the condition that in the ideal furnace the heat should actually be produced *within* the crucible. This requires an electric induction furnace, but for various reasons which are set forth

FIG. 1.—TIN PYROMETER.

FIG. 2.—ROGERS PYROMETER.

it must be a furnace obtained without the use of iron. Such a furnace, of 20-kw. capacity, Dr. Northrup has succeeded in constructing by employing high-frequency currents (up to 25,000 cycles per second at 7,000 volts) in an induction coil of some 50 turns to induce very large currents in the crucible—walls or contents—which it surrounds. The primary currents are oscillatory, and produced from the discharge through condensers of a two-phase, 60-cycle, 220-volt supply. The apparatus seems complex; in reality it is very simple, and in peace times—as pointed out by Mr. E. H. RAYNER—is an ordinary marketable wireless outfit of somewhat high power. The thermal efficiency of the 20-kw. furnace is as high as 60 per cent.; it will melt 45 lb. of brass in 35 minutes, and the vacuum type will bring a 14-cm. diameter graphite furnace filled with tin or glass to a temperature well over 1,600 deg. C. in 40 or 50 minutes. Dr. Northrup was in hopes of attaining 2,000 deg. C., and the building of furnaces of large units was in contemplation. The furnace, which is made by the Ajax Metal Co., of Philadelphia, was most favourably received by those competent to judge, and the type was considered to have a future before it. Certainly a furnace in which metals like tungsten and its alloys can be melted *in vacuo*, free from carbon, is one which metallurgists keenly desire.

Dr. Northrup's latest appliances for measuring high temperatures were no less interesting. Up to 1,300 deg. C., temperatures in any kind of atmosphere can be accurately measured by means of well-constructed platinum-rhodium thermocouples, but the potentiometer on which the E.M.F. is

measured must be of a robust, portable type. Such an instrument, used in connection with a direct deflection millivoltmeter (that can be calibrated to degrees), and known as the "Northrup Pyrovoltmeter," was described in the paper. It being a deflection instrument, its accuracy and permanency depend upon the permanence of a permanent magnet rather than upon that of a standard cell, and as the voltmeter is introduced into the circuit after balance has been obtained in substitution for a copper coil of equal resistance, its temperature coefficient introduces no errors. We believe that in this country Dr. Rosenhain has also designed a workshop type of potentiometer.

A somewhat similar type of potentiometer was described in a paper communicated by Mr. RICHARD P. BROWN, of Philadelphia. In this a direct reading on a high-resistance millivoltmeter from the thermocouple is measured by comparison with an equal voltage from a dry-cell circuit. The temperature coefficient of the meter is likewise eliminated by furnishing a copper resistor in the meter equivalent to the copper or aluminium of the coil. The high resistance of the voltmeter, up to 1,000 ohms, is secured by reducing the weight of the moving element to a minimum. It is made of an aluminium alloy wire 0.003 in. dia. enamelled for insulation.

Thermocouples and High-temperature Thermometers.—Mr. Brown tells us that in the States nitrogen thermometers, taking the form of a copper bulb actuating through capillary tubing an expansive spring, are considered the most satisfactory instruments to use up to 425 deg. C. Mr. J. C. RHODIN drew attention in this connection to the Wiborgh pyrometer, which was successfully used for controlling the temperature of an air blast-furnace up to 800 deg. C. This was a gas thermometer in which a known quantity of air under a known pressure was pressed into the bulb. For temperatures up to 1,100 deg. C. a base-metal thermocouple, usually compounded of 90 per cent. nickel and 10 per cent. chromium, and 98 per cent. nickel and 2 per cent. aluminium, is generally employed in America. For temperatures up to about 1,300 deg. C. platinum and rhodium thermocouples are in vogue in America as well as in this country, but they are unsatisfactory. Dr. Northrup tells us, in a reducing atmosphere above about 145 deg. C. A thermocouple of tungsten-molybdenum though giving a small E.M.F., can be used to measure extreme temperatures if protected from hot gases.

For temperatures up to nearly 1,700 deg. C., Dr. Northrup recommends the use of molten tin (boiling point 2,270 deg. C.) as the pyrometric substance, and he describes a form of molten-tin thermometer with a bulb and stem of graphite, in which the height of the column is determined by electrical contact. A cross-sectional view is shown in the accompanying figure (p. 533). Dr. Northrup urges investigations into the possibilities of molten tin for extending the fundamental temperature scale above the limits of the gas thermometer.

Base-metal thermocouples were also discussed by Mr. C. R. DARLING and Mr. G. E. M. STONE. Mr. Darling and Mr. A. W. Grace have shown that in general the E.M.F. of a couple is not affected by the fusion of one or both of its elements, and if, therefore, provision be made for either element to fuse without breaking the circuit, the employment of such couples is feasible up to 1,500 deg. C. Mr. Stone's paper, which was of considerable practical interest, dealt with remediable causes of unreliability encountered in thermoelectric pyrometry, especially in base-metal systems. A very common source of trouble could be traced to the low terminal resistances of instruments.

In work where high accuracy is desired, the temperature of the cold junction needs careful watching, and Mr. R. S. WHITTLE advocated burying this some 10 ft. or more beneath the floor, protecting it by a metal sheath filled with bitumen or powdered magnesia. Such buried thermocouples are being successfully used in works practice, and, as Mr. Whittle has one great difficulty in using thermocouples at high temperatures is the protection of the couple from direct contact with the molten metal of the furnace, under measurement, Dr. H. ROGERS boldly cut this Gordian knot by letting the tips of the elements—not, otherwise, united—actually dip into the molten metal (fig. 2). Only a very short immersion is necessary for a steady reading, so there should not be unduly rapid deterioration of the expensive wires composing the elements. The method deserves a good trial. Incidentally, we may refer here to a rough workshop method, Mr. S. N. BRAYSHAW uses for standardising pyrometers, in which he melts a 60/40 copper-iron alloy in a crucible of wonderful stability, in a deep graphite crucible in an atmosphere of coal gas, covering the molten alloy with charcoal. This gives a fixed point of 1,112 deg. C. which happens to be the α/β transformation point of iron-based 1.1 per cent. carbon, and 0.5 per cent. tungsten commercial steel.

Automatic Control Pyrometry.—Several speakers touched on this important subject, and Mr. C. E. ROSSIE expressed a widely-held view, which manufacturers should take note of, that the automatic control of a furnace by means of a pyrometer, although presenting many difficulties, was a practical proposition with a future before it. Mr. S. A. MAX, of Melton, Hayfields, Ltd., exhibited an automatic control instrument for operation on electric furnaces. In this a nickel-chromium alloy thermocouple actuates a high-resistance millivoltmeter. A small motor or clock depresses the instrument pointer every 10 seconds, and thus brings together two con-

tacts which, working through relays, actuate the switch controlling the furnace current. A valve of a gas or oil furnace can be similarly controlled, and the principle may be applied to signalling pyrometers showing red, white, or green lights according as the temperature is too low, within limits, or too high.

(To be concluded.)

THE NITROGEN PROBLEM.

THE war has forcibly brought home the vast service that science can render to trade and industry. In almost every branch of business the chemist and scientist can reduce costs, increase profits, and open up new fields for the merchant to conquer. Research incidental to the conduct of the war has shown that this applies particularly to those industries dependent on nitrogen compounds. Forced by circumstances to face the problems connected with the provision of ammonia and of nitric acid by the newer synthetic processes, we are well on the way, thanks to the valuable work of the Nitrogen Products Committee of the Munitions Inventions Department, to solutions that promise permanent benefit to the agriculture and commerce of Great Britain, apart from the immediate assistance rendered towards the successful prosecution of the war.

Nitrogen compounds are essential for explosives, and in the form of fertilisers for agriculture. The world's consumption for agricultural purposes almost doubles every 10 years; in 1913 it was no less than 2½ million tons of Chile nitrate, and about 1½ million tons of sulphate of ammonia. As long ago as 1898 Sir William Crookes predicted a shortage in the world's wheat supply, and urged the vital importance of finding other sources of nitrogenous fertilisers in view of the fact that the natural deposits of Chile nitrate were limited in quantity. Sir William himself experimented in obtaining nitrogen from the air, in which it exists in unlimited quantities. Other countries appreciated the possibilities thus indicated, and set to work on the problem of nitrogen fixation. Norway, being at an advantage with cheap water power, adopted the arc process, which produces nitric acid direct from atmospheric nitrogen and oxygen, but only by an enormous consumption of power. Germany, on the other hand, concentrated, in the main, on bringing to a commercial success a process worked by Prof. Haber for producing ammonia by the union of hydrogen and atmospheric nitrogen at extremely high pressures and at an elevated temperature. We, however, with whom the idea of nitrogen fixation originated, did nothing, the ammonia recovered at gasworks and coke ovens being practically the only form of combined nitrogen produced in this country.

When the war began, the Central Powers, by extending their established nitrogen fixation processes, and by developing others, such as the cyanamide process for the production of nitrolin or ammonia, and the oxidation process for converting ammonia into nitric acid, became self-sustaining. Although the command of the seas enabled us to import from Chile all the nitrate of soda we needed for munitions and agriculture, and so escape the consequence of our scientific neglect, the beginning of the submarine campaign in February, 1916, forced us to review the position.

In June, the Nitrogen Products Committee was set up under the chairmanship of the Comptroller of the Munitions Inventions Department of the Ministry. Before the Committee lay the difficult task not only of discovering the working details of some of the more important processes which are carefully guarded by the foreign firms who are working them, but of making the processes commercially practicable. Because of the pre-eminent position held by the Haber process in Germany, where the economic conditions as regards coal supplies and the comparative absence of water power are similar to those here, and because it was plain that the research would be especially difficult owing to our limited knowledge of the process, attention was first directed to the problem of the production of synthetic ammonia. The Committee then turned its energies to bringing to a commercial stage the ammonia oxidation process for producing nitric acid from gasworks and other forms of ammonia, a process which had not hitherto been practised in England, although worked to some extent on the Continent.

The fruitfulness of the Committee's inquiries led to the issue of an interim report in February, 1917, and on this the Minister (Mr. Addison) decided to take action, among other things upon the ammonia oxidation process. The Explosives Department has since taken over the task of establishing the process on a commercial basis. Manufacturers interested in ammonia oxidation met the Comptroller and the research staff, with the practical outcome that in several of our largest chemical works the process is being introduced to take the place of the nitric pots used in the making of sulphuric acid by the Chamber method. Seeing that before British chemists concentrated their attention on this problem the annual consumption of Chile nitrate for the purpose in question was 1,500,000 tons, the saving of 1,000,000 tons by the adoption of the ammonia oxidation process may become very material. The investigation of the Haber process has involved the

solution of several difficult chemical engineering problems, as was to be anticipated in operations necessitating the compression and manipulation of gases at extremely high pressures. The whole of the conditions governing the process have been thoroughly studied, with the result that a method of working has been devised whereby the output of ammonia per unit of plant has been increased to a figure which, as far as is known, has never been approached, even in Germany, the home of the process. A semi-technical Haber unit is now in operation, and is providing data concerning the few further details to be elucidated prior to the erection of a full-sized unit. As an outcome of this synthetic ammonia research work, a process has been discovered for the preparation on a large scale of the purest hydrogen, and the promise displayed in small-scale work is now being put to the test by semi-commercial trials.

Although the Committee has concentrated particularly on processes valuable as war measures, the possibilities of nitrogen fixation in relation to agricultural and commercial requirements after the war have not been lost sight of. The manufacture of cyanamide or nitrolim, a valuable fertiliser, has been investigated by a deputation which proceeded abroad for the purpose. It is not unlikely that the industry may be established in this country to meet the demand for fertiliser that is anticipated as a result of the Board of Agriculture's new policy, which will bring several million additional acres into cultivation.

To establish certain nitrogen fixation processes on a sound basis cheaper electric power will be imperative. An inquiry has been made as to the possibility of cheapening the production of electric power from coal by the use of methods permitting of the recovery of ammonia, fuel oils, and other by-products hitherto wasted when raw coal has been directly used. Schemes for the utilisation of various undeveloped water powers in this country for electric power production have also been examined. The survey of a particular drainage area has recently been completed, and has revealed a potential source of 40,000 electrical horse-power in an important industrial area. Finally, the Nitrogen Products Committee has investigated the probable requirements of this country for nitrogen compounds, and has gone carefully into the probable costs of manufacture by the various synthetic and non-synthetic methods in the light of experience in allied industries.

Moreover, in order to review the nitrogen problem as it affects the Empire, the Committee has got into direct communication with official representatives of Australia, Canada, New Zealand, South Africa, Egypt, and India. It is in touch, too, with Allied countries; France, Italy, and Russia have representatives acting in liaison with the Inventions Department on the nitrogen problem.

The final report of the Committee, which it is hoped will not be long delayed, will form an impressive record of scientific industry and resource, bearing testimony to the truth that Great Britain, once she is roused, is equal to any emergency.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

British Methods in Foreign Trade.

A letter from India recently appeared under the above heading in some of the electrical papers from "Trumpeter," and I crave leave to give a small example of how things should not be done.

In September, 1916, when on the point of returning to India, I personally gave an order to a very well-known London firm for an electric toaster, paying the cost there and then—some 22s., I think. I was, of course, fully prepared for delay, as none of these were in stock at the moment. Dispatch was advised a few months ago, and the toaster arrived in September, 1917. I used it at breakfast for exactly six days before it burnt out, the pressure being correct (220 volts) within a small margin. But the point is that it *would not make toast*. The elements are placed at the two sides with a wide vertical strip in between, so that no ingenuity could prevail on the bread to toast down the middle. The engineer of the Simla supply, whose electric fires and water heaters are ahead of most types I have met, re-wired the device for me in a sensible manner, and now it makes good toast.

J. W. Meares.

Simla, October 13th, 1917.

The E.T.U. or the A.E.S.E.?

I am desired by the members of the Marylebone Branch of the National Amalgamated Union of Enginemen, Firemen, and Electrical Workers to call the attention of "Progress" to the fact that there are about 11 or 12 Unions catering for

the employees of the generating stations. Up to the present moment Mr. Meakin is the only trade union agent known to us who took the initiative in trying to get a base rate for London and suburbs in the power stations. Something like two years have passed since inquiries were made in a certain direction on the part of the N.A.E.U. which ultimately led to the matter being placed before Sir Geo. Askwith. The official figures submitted were so startlingly diverse with respect to the wages of the generating and distributing staffs of 10 leading power stations that the Marylebone Branch decided to commission Mr. Meakin to make inquiries all round. He started straight away, and the task is not yet completed. We would like to ask why another union is to be formed only to go over the same ground as we have traversed? To put an end to this piecemeal method of working, it has been suggested by an official of another trade union that a round-table conference of all the secretaries of the trade unions interested should be arranged. I make the suggestion as it was given out, and perhaps some of your readers would like to offer opinions through your columns.

J. Vincent,

Branch Secretary.

The National Amalgamated Union of Enginemen, Firemen, Mechanics, Motormen and Electrical Workers.

London, N.W., December 3rd, 1917.

I read with great interest the letter from "Progress," but before starting a new trade union would it not be just as well for some of the older ones to declare their policy? In common with many others, I have been asked to join the E.T.U., but I am in doubt on one vital point, viz., shall I ever be asked to come out on strike to support wiremen who may be asking for a rise in wages?

Puzzled Engineer.

The Status of Draughtsmen.

Among the mass of correspondence dealing with industrial questions, the claims of draughtsmen have not received that attention which is undoubtedly their due. Possibly this is owing to the draughtsman's unfortunate habit of brooding over his grievances, rather than openly ventilating them; and it is this peculiarity which has unquestionably led to the passive acceptance of his present relatively low status.

Now, it is quite obvious to everyone that the successful prosecution of the war depends upon the speedy turning out of ships, aircraft, guns, together with a variety of electrical and mechanical devices; but what perhaps is not so generally recognised is the fact that without the draughtsman's skill and ingenuity none of these things could possibly materialise.

In other words, the draughtsman's work is the keystone to the whole of the shipbuilding, engineering, and electrical industries.

The patriotic example shown by draughtsmen in consistently sticking to their work during the national upheaval, when other trades have so easily obtained their objects by other and more drastic methods, has met with little response on the part of the powers that be; but this is only in keeping with the attitude hitherto adopted by those in authority of deliberately refusing to recognise openly the draughtsman's true importance in the industrial world.

As, therefore, it is obviously futile to place reliance in human sympathy and sense of fairness, draughtsmen must look to themselves, and by combined and concerted effort see that the causes which have created this feeling of suspicion and unrest are finally and positively removed.

Might I point out to your readers that the Draughtsmen's Association has already done magnificent pioneer work in this direction, and only the loyal support of all draughtsmen is needed to enable its aims to be successfully achieved.

J. D. Murray.

President, Merseyside Branch of the Association of Engineering and Shipbuilding Draughtsmen.

Birkenhead, November 30th, 1917.

[We are fully aware of the high value of draughtsmen's work, and of the low esteem in which, for some inexplicable reason, it is held by the engineering world outside their ranks; and we cordially sympathise with them.—Eds. Elec. Rev.]

Concert.—The Association of Engineering and Shipbuilding Draughtsmen (London Branch) are holding their first Bohemian Concert to-morrow (Saturday) at 7 p.m., at the "Caledonian Salon," Holborn Restaurant. The following are the artists:—Miss Diana Hughes, soprano; Mrs. E. M. Pearson, mezzo soprano; Miss Winifred G. Winter, songs at the piano; Mr. E. H. Walker, tenor; Mr. Reginald Yates, baritone; Mr. W. Hanson Crossland, tenor; Mr. Fred. Emerton, entertainer; Mr. Albert L. Walter, solo pianoforte; Mr. F. Ollerenshaw, tenor.

WAR ITEMS.

Building Work to be Further Restricted.—At present no building work costing more than £500 may be proceeded with without special permission from the Government. The *Times* states that the regulation is to be carried further. The new Rule will prohibit "any form of constructional or decorative work, with few exceptions, without express permission." The object is to prevent unnecessary work being undertaken while there is a pressing need for men accustomed to such labour for urgent war purposes.

The Coventry Strike.—The strike of 50,000 workers at Coventry, which ended early in the week, represented, says the *Daily Telegraph*, on an eight-hours day basis, the loss beyond recall of 3,200,000 hours of labour on aeroplane production.

Industrial Reconstruction.—Under the auspices of the Employers' Parliamentary Council a national conference will be held at the Central Hall, Westminster, on Wednesday, December 12th, to discuss and determine a united policy in regard to the proposals of the Government with respect to reconstruction and to industry and trade after the war. A resolution will be submitted welcoming the recommendations of the Whitley report, but submitting that to successfully give effect to the proposals it would be essential that agreements between organisations of employers and employed should be legally enforceable; that all combinations of Capital and Labour should be subject to the ordinary law of the land; and that the provisions of the Trade Disputes Act which gave immunity in this respect should be repealed.

A Government Labour Committee.—The War Cabinet has appointed a Government Labour Committee, consisting of the following members:—Rt. Hon. G. N. Barnes, M.P. (Chairman), Sir Auckland Geddes, K.C.B., M.P. (Vice-Chairman), Sir George Askwith, K.C.B., K.C., Mr. Guy Calthrop, Sir Lynden Macassey, K.B.E., Mr. I. H. Mitchell, and Mr. U. Wolff.

The Committee will deal with questions of wages (including the interpretation of the Orders relating to the increase of 12½ per cent. recently granted to plain time-workers in certain industries) and to co-ordinate the settlement of labour questions affecting Government Departments. The committee may confer with a consultative committee consisting of representatives of the principal Government Departments concerned with industrial questions. The functions of the Government Labour Committee will not supersede those of the arbitration tribunals set up under the Munitions of War Acts by the Ministry of Labour.

Exemption Applications.—At Southwark, Messrs. W. P. Catterson & Sons, manufacturers of gas and electric lamps, of Newington Causeway, were requested to show cause why certificates of conditional exemption should not be withdrawn granted to their buyer, 41, in grade 3; a head counter-man, 40, fit for labour abroad (B2); a salesman, 36, in grade 3; and another salesman, 38, fit for sedentary work at home. The firm now employed 15 other men, all over military age, and nine women in the office, who had taken the places of men who had joined up. The bulk of their work was for Government Departments. The counter-man had been with the firm 19 years, and was now doing the work of three men. Ald. Hewitt: Will you tell us the number of articles you deal in? Mr. Catterson replied that their catalogue contained over 6,000 articles. Coun. Weaver: It does not appear as if the business would be ruined if we took the counter-man. Coun. King: What is to prevent you having a lady in your showroom? Mr. Catterson said that Government contractors called at the showrooms to see if they could obtain substitutes for various articles, and it was essential that there should be a man there with an intimate knowledge of the goods. They had 45 men before the war, but now had only 22. The National Service Representative said the firm was lucky to have three men in low medical categories. These were granted six months' exemption each, and the appeal for the counter-man was dismissed, the National Service Representative undertaking not to call him up for three months.

A Glasgow Corporation tramway motorman, 39 years of age, appealed to the Lanarkshire Military Appeal Tribunal against the withdrawal of his exemption. He had been 21 years in the Army, was mobilised on the outbreak of war, and served in Gallipoli and Egypt. He appealed on the ground that he was in a certified occupation. He had been in the Corporation tramways service since 1901. The Sheriff and appellant was in a certified occupation, and exemption was granted.

The Midale Tribunal put back nine tramway employees, all A, B1 or C1 men, to February 28th. Mr. G. Webster, the tramways manager, said there was a shortage of drivers, and the employees had often to work seven days a week and very long hours. Four cars had to be taken off the service in order that the men could appear before the Tribunal.

At the Shoeburyness Tribunal, Mr. Lewis Davis, of Curtain Road, E.C., who covered up electrical fittings, appealed on business grounds for G. W. Hardy, aged 39 years, classed A, for a final offer, for the fourth time. Mr. Davis said that as an electrical work they were engaged on. They made the double wire and wiring. There were about 120 yards

engaged, and he did not know what would happen if this man had to go. It was highly technical work. His wages were 49s. a week. He felt convinced that many of the girls would be thrown out of work if he had to go. The Tribunal discussed the small wages paid to the man. Hardy said there were about 200 machines running, and he looked after the motors. The Tribunal decided to grant four months, and the Town Clerk said it was the opinion of the Tribunal that this man could not be claimed as indispensable when he was paid so little.

At Windsor, Mr. H. Fowler, electrician, appealed for F. G. Isgrove (18, B1), his apprentice. Mr. Fowler is in the R.N.A.S., and Mrs. Fowler stated that if Isgrove was taken there would be no skilled person to carry on the business. There was another apprentice, aged 16; both worked together, but the younger lad could not manage the work alone. Five, including her husband, had enlisted from the business, which was the only one of its kind in Windsor. A month's respite was granted to see if anyone could be obtained to replace Isgrove.

At Stratford-on-Avon, there was a Military review of the case of A. Baldwin (40, B1), electrician to Mr. J. Fielden, Little Kington. The Military were willing that the man should remain until a capable substitute was found, and Mr. Fielden stated that the man was in charge of his electric light plant, which provided light for the hospital. The Military suggestion was agreed to.

Elland Tribunal has refused an appeal by J. Sykes, electrician, but he is not to be called before the end of January.

Surrey Appeal Court has granted three months' exemption to E. Lown (31), who is in charge of the electric plant at the Farcombe Paper Mills.

East Kent Appeal Court has granted exemption until May 26th to Mr. C. Campbell (41), managing secretary to the Whitstable Electric Co., Ltd.

At Southend-on-Sea, exemption until February 1st was granted to C. C. McBride (18), electrician's apprentice, of Westchill, to enable him to obtain a commission. He had already been in the Army.

Leyton Tribunal has granted six months' exemption to W. H. Ruddock (31, C3), electrical mechanic at the Alliance Kinema.

At Southwark, the National Service Representative drew attention to the cases of men granted certificates under the Protected Trades Schedule, pointing out that these men, many of them young and passed for general service or garrison duty abroad or at home, were not called upon when granted their certificates to join the V.T.C. or the Special Police. There was a feeling in the borough, as well as throughout London, by men granted exemption by tribunals who were compelled to join these forces as a condition of their exemption, that the men in munition works should also be compelled to do something of national importance. He thought that these men in munition works were capable of becoming efficient members of the defensive forces. The Tribunal decided to communicate with the department responsible for granting the certificates, urging that it should be a condition that the men securing them should join either the V.T.C., the Special Police, or the Red Cross.

LEGAL.

GAS LIGHT AND COKE CO. v. HACKNEY BOROUGH COUNCIL.

In the Court of Appeal, before Lords Justices Swinfen Eady, Warrington, and Scrutton, on Thursday, November 29th, the case of the Attorney-General, at the relation of the Gas Light and Coke Co., Ltd., v. the Metropolitan Borough of Hackney was heard, upon the appeal of the Gas Light and Coke Co. from the judgment of Mr. Justice Astbury in the Chancery Division.

MR. COLEFAX, K.C., in support of the appeal, said Mr. Justice Astbury had dismissed the action with costs, and shortly stated the point had reference to the charges for electricity that were made by the Borough of Hackney—whether or not in their charge for power they infringed the provisions of Sections 19 and 20 of the Electric Lighting Act. The plaintiffs' submission was that Mr. Justice Astbury had not given effect to the judgment of the Court of Appeal in the Long Eaton case, and, further, that he had unduly made distinctions between that case and the present one. In the Long Eaton case the facts were that persons using power for running their machines, if they took all their light from the company, got it at a cheaper rate, while, on the other hand, if they only took it for one purpose, they did not get it at the cheaper rate. The Borough of Hackney had given to the power user a reduced charge in respect of lighting up to the extent of 20 per cent. of the energy user's other charge, thereby giving the user a benefit over one who only took electrical energy for light. The charges were divided under two heads—one for light and one for power, with alternatives for lighting; and the circular of which his clients complained in the present proceedings went on to say that consumers paying under this scale (that was for power) were allowed to use 20 per cent. of the energy supplied, for lighting. Plaintiffs admitted that a power user in respect of electrical energy for power had a better load factor and a better diversity factor than a light user under ordinary circumstances; but the power user when he used

light worsened the position at the central power station, and in fact, *quid* the user of light, he was no better for the power station—if so good—than the ordinary user of light and the non-power user of light. His broad point was that the Borough of Hackney, having regard to the Long Eaton case, was not entitled to give to a power user a preferential charge in respect of light. It was an inducement to the power user to cheapen the cost of his power by taking light without any corresponding benefit to the station. In the Court below, evidence was given that the charges of the Borough Council of Hackney for power resulted in a loss; but as the learned Judge was of opinion that the evidence was irrelevant, he would not go into that part of the case. He contended that the present case was on all fours with the Long Eaton case.

On Friday MR. WALTER, on behalf of the respondents, in support of the judgment of the Court below, said the appellants' case was based on a misconception as to the true effect of Secs. 19 and 20 of the Act. What they had sought to do was to read the Act as though the sections were not framed to prevent different charges to different consumers but between a different consumption. Electric supply undertakings supplied one thing, and that was electricity. The only interest they had was in the use of the energy supply, in so far as that use affected their cost of supply. An electric light undertaking had to be on a scale to meet the maximum demand which at any time might be imposed on the plant. That was of fundamental importance in considering the question of cost. Capital charges went on whether they generated little or much electricity. The ordinary lighting was only for about two hours a day, taking the year through. Therefore all electric light undertakings endeavoured, as far as they could, to extend the useful work of their station. What the Court was asked to say was that the customer who used the plant for but two of the 24 hours could not be charged differently to the man who used the plant for 11 hours. That was really what the appellants were asking. All the authorities were absolutely in favour of the respondents. If they had to make separate charges to consumers who used both power and light, they would have to have separate meters and separate wiring, which would probably cost thousands of pounds. The Act of Parliament had nothing to do with power, nothing to do with light, and nothing to do with charges. They had power to distinguish between the classes of consumption and the classes of consumers. There was no such distinction known as a differentiation between power and light for the purposes of the Act. No evidence had been given at the trial that there was any undue preference. The prices were based on the fact that if they got a customer of a certain kind the prices charged by the station would be remunerative. There was no suggestion in the evidence that the rates were not perfectly fair. The only thing that was suggested was that the respondents were not entitled to charge the consumers on that basis.

The further hearing was adjourned until Monday.

RE TAYLOR & CO. (HATTON GARDEN), LTD.

IN the Chancery Division, on Friday, Mr. Justice Astbury granted an injunction restraining Taylor & Co. (Hatton Garden), Ltd., and Miss Julia Taylor and Ernest W. Tester, the signatories and shareholders of the company, from using the name Taylor & Co. (Hatton Garden), Ltd.

MR. F. RUSSELL, K.C., who appeared for the plaintiff, Moritz Bergl, an Associate Member of the Institution of Electrical Engineers, said he had a considerable experience in the mica trade, and in 1912 he came in touch with the defendant, Miss Taylor, who was the sole owner of the business in Hatton Garden of Taylor and Co. They entered into a partnership, which eventually was dissolved, and the partnership assets were to be sold. In the meantime, the defendants had registered the name of the defendant company, and the plaintiff only discovered this from an announcement in the ELECTRICAL REVIEW. He (counsel) submitted that no one knowing that a company with this name had been formed would bid at the sale for the partnership goodwill, and the sale would be prejudiced by the name being allowed to remain on the register.

MR. RAM, for the defendants, said Miss Taylor had not intended to do anything wrong; she hoped that no one from the outside would attend the sale, and that she would secure the business. She intended to do nothing with the company until the sale was completed.

His LORDSHIP said the case for the defendants was hopeless, although he was not satisfied that the lady intended to do wrong. The injunction must go with costs. Both parties then agreed to the appointment of a Receiver of the partnership business.

TRAMCAR FATALITY CLAIM.

AT Leeds Assizes, last week, Miranda Dickinson, widow of a Huddersfield Corporation tramcar driver, claimed £500 damages against the Great Northern Railway Co. in respect of the death of her husband, Lewis Dickinson, who died as the result of injuries received in a collision between his car and a railway lorry. There was conflicting evidence as to the lorry's lights. The jury found for the plaintiff, the lorry having crossed the tramlines either diagonally or broadside on, and the lights being, therefore, not fully effective. The parties being agreed as to £500 damages, the jury were asked to apportion the amount, and awarded £250 to the widow, £100 to a boy child aged 12, and £150 to an infant child.

GOODLAND v. EDISON ACCUMULATORS, LTD.

IN the King's Bench Division, on Monday, Mr. and Mrs. Goodland, of Maida Vale, were awarded £695 damages against the Edison Accumulators, Ltd. The female plaintiff received serious injuries, alleged to have been due to the negligent driving of a motor lorry by the defendants' servant on April 30th. The lorry, it was stated, turned on to the footpath, knocked over a motor-cycle and side-car, and then knocked down Mrs. Goodland.

MR. THORN DRURY, K.C., for the defendants, admitted that Mrs. Goodland met with a nasty accident, but said she had made an extraordinarily good recovery. The only question was the amount of the damages.

MR. RIGBY SWIFT, K.C., for the plaintiffs, asked the jury to give compensation to the husband for the medical and other expenses he had been put to, and, far more important, to give compensation to Mrs. Goodland for the pain and suffering she had undergone in consequence of the accident.

Medical evidence was called on both sides, and MR. JUSTICE COLERIDGE having summed up, the jury awarded £95 to the husband and £600 to the wife, and judgment was entered accordingly.

MR. DRURY considered the damages excessive.

His LORDSHIP: Then you must go to the Court of Appeal.

HENDON ELECTRIC SUPPLY CO. v. BANKS.

JUSTICES A. T. LAWRENCE and Shearman, sitting as a Divisional Court, heard the appeal of the Hendon Electric Supply Co. from a decision of the County Court Judge at Barnet in the action of the company against Walter Banks, of the Hampstead Garden Suburb.

SIR E. POLLOCK, K.C., M.P., and Mr. Ball were for appellants, and Mr. Emery for respondent.

SIR E. POLLOCK stated that appellants brought an action in the County Court to recover a sum of £3 6s. 5d. in respect of electricity supplied to the defendant. The County Court Judge held that the plaintiffs were not entitled to recover, holding that the Electric Lighting Order applying to this case laid it down that the ascertainment of the amount was first to be made by an electric inspector within the meaning of the Act, and that, as that had not been done, the plaintiffs were disentitled to proceed with their claim. He, therefore, gave judgment for the defendant. The matter was of importance to the appellants, and, therefore, an appeal had been allowed by the County Court Judge. If the latter's decision stood, it fettered to a large extent the powers of the company to recover against the consumers of their electricity. In June of last year a new meter was fixed upon defendant's premises. When the meter was fixed, they forgot to take out the locking screw, the result of which was that the meter did not register. At the end of the quarter in September not much remark was made of the fact that no electricity was registered as having been consumed; but when the December quarter came, and no electricity was registered as having been consumed, the company were surprised, and on February 22nd they sent an inspector, who found that the meter was not working, and he pulled out the locking screw. Then the question arose as to how to ascertain the amount of electricity which had been consumed. The company claimed in accordance with the Act and the contract on the basis of the consumption in the corresponding quarter in the previous year.

MR. EMERY, for respondent, said there were several meters in the house, and the one in question controlled a heating apparatus which, defendant said, was not used during the periods in question, for he was using coal fires for heating.

SIR E. POLLOCK said a letter had been written since the trial at Barnet, in which it was agreed that the County Court Judge held that electricity had been used through this meter in the periods in question.

MR. EMERY dissented from that, and said the County Court Judge made no finding of fact at the trial. Upon the question of law he gave judgment for the defendant, without costs.

JUSTICE SHEARMAN: It is a point of law we are here to decide, is it not?

SIR E. POLLOCK: Yes. The defendant by contract in writing dated March 20th, 1915, agreed to take a supply of electricity upon certain conditions, under which defendant agreed to the supply being ascertained by the meters provided by the company; and, in the event of any difference as to the correctness of the meter, the dispute was to be settled in the manner provided by the Electric Lighting Acts. One of the clauses of these Acts provided for the appointment of an inspector to ascertain the amount of electricity which would have been consumed if the meter had been working, but no inspector had been appointed in this district for that purpose.

JUSTICE SHEARMAN: If an inspector were appointed, you would have to pay his salary, and that would probably be larger than the amount you would receive under his awards.

SIR E. POLLOCK pointed out that if an inspector were appointed, the consumer would have to pay the costs if he had acted unreasonably in raising a dispute before him. And in the ordinary case the inspector would have no power to give judgment; all he could say was whether the meter was right, and then the company would have to sue the consumer in the County Court.

After hearing Sir E. Pollock argue the legal point in the case, their Lordships gave judgment without calling upon Mr. Emery for respondent.

JUSTICE LAWRENCE, in his judgment, said that Clause 57 in the Schedule of the Electric Lighting Act of 1899 provided that where a difference arose between the consumer and the undertakers as

to whether any meter was not in proper order for correctly registering the value of the supply, that difference should be determined, upon the application of either party, by an electric inspector appointed by the local authority or by the Board of Trade, and that inspector should order by which of the parties the costs in the proceedings before him should be paid, and the decision of the inspector should be final, binding all the parties. A determination by the inspector was demanded by the consumer in this case, and unfortunately no electric inspector had at that time been appointed. He did not see that that entitled the County Court Judge to assess the amount of electricity consumed. He was bound to say, as he did, that the Act of Parliament had itself provided for the mode of determining such a dispute, and until it was so determined, no cause of action arose. He did not see why it could not still be determined, and then a cause of action would arise; but that point had not been argued, and therefore he did not judicially decide it.

JUSTICE SHEARMAN: I am of the same opinion, for the same reason.

The appeal, therefore, was dismissed, with costs.

BUSINESS NOTES.

The Tungsten Lamp Association.—An announcement issued by the secretary, Mr. A. Lazenby, states that as from December 1st this association has removed its offices to 46, Queen Victoria Street, London, E.C. 4. The telegraphic address and telephone number are unaltered.

Ferranti Contracts.—**MESSRS. FERRANTI, LTD.,** have received the following contracts:—

Manchester Corporation.—Annual contracts for meters and for current transformers, also a contract for three 500-k.v.a. three-phase transformers.

Kilmarnock Corporation.—One 100-k.v.a. three-phase transformer.

Birmingham Corporation.—One 100-k.v.a. three-phase transformer.

Darlington Corporation.—One 400-k.v.a. three-phase transformer.

Hal Williams & Co. (for Clayton & Shuttleworth, Ltd.).—One 375-k.v.a. three-phase transformer.

German Company for Ship Installations.—The Schiff's Installation Akt. Gesell. has been founded at Bremen (with a capital of £68,500) with the special object of manufacturing and installing apparatus for the electrical equipment of ships. The founders of the company are:—The Lloyd Dynamo Werke (Bremen), Backethal Draht u. Kabelwerke Akt. Ges. (Hanover), C. Lorenz Akt. Ges. (Berlin), Deutsche Nationalbank (Bremen), and Kommerz u. Disconto Bank (Berlin).

Dissolution.—**ELECTRICAL MEDICAL MANUFACTURING Co.,** 161, Gower Street, London.—Messrs. A. Lloyd & R. J. Wickham have dissolved partnership. Mr. Lloyd will attend to debts and continue the business.

Book Notices.—The November issue of the Tramways and Light Railways Association *Journal* contains the full report, by Col. Pringle, of the Board of Trade, on the Dover tramway accident.

"Practical Electricity." By T. Croft. London: Hill Publishing Co. 8s. 4d. net.

Catalogues.—**MESSRS. EDGAR, ALLEN & Co., LTD.,** of Imperial Steel Works, Sheffield, have issued a brochure entitled "The Making of a Tramway Point." The earlier pages contain many half-tone photographic reproductions illustrating the various stages of manufacture of a tramway point. The latter half of the book contains a reprint of a paper by Mr. F. Bland on "1883 to 1913, or Thirty Years of Tramway Practice."

LIGHTING AND POWER NOTES.

Barrow-in-Furness.—**PRICE INCREASE.**—In view of the increasing cost of coal, the T.C. has agreed to a general increase of 20 per cent. in the flat rate and demand system charges. Prepayment meters:—Flat rate, 20 to 25 per cent. increase; on the demand system the fixed weekly charges will be increased by 2d. to 3d. per week. The tender of Messrs. Siemens for sub-station switchgear, at £403, was approved, as also a proposal of the electrical engineer to ask for Government authority to order an additional turbo-alternator, and obtain tenders for same.

Blackburn.—**PRICE INCREASE.**—The Electricity Committee has decided to advance the price of electricity by 10 per cent., making 25 per cent. since the war started.

Braintree.—**PROV. ORDER.**—The Crittall Manufacturing Co. Ltd., has applied for a prov. order for electric supply within the area of the F.D.C.

Calder Valley (Yorkshire).—**WAGES BOARD.**—It is expected that a municipal wages board for the various towns and townships of the Calder Valley will shortly be established, covering Halifax, Brighouse, Elland, Todmorden, Sowerby Bridge, Hebden Bridge, Ludendenfoot and Mytholmroyd.

Cleckheaton.—A breakdown to the generating plant has necessitated an appeal to the public to restrict the use of electricity during the evening.

Colne.—The Electricity Committee has appointed a Sub-Committee to consider the question of an advance in the price of electric current, in view of the advance in the cost of coal.

Darwen.—**WAGES.**—The Corporation has declined an application for an advance of £1 per week in the wages of employes at the electricity works, put forward by the Union of Enginemen.

Deal and Walmer.—**PROV. ORDER.**—The B. of T. has prolonged the prov. order of the electricity company for a year.

Derby.—**EXTENSIONS.**—An important scheme for the development of the electricity undertaking, involving a total outlay of over £50,000, has now been decided upon. This includes the erection of a coal elevator, for which the tender of Messrs. G. Fletcher & Co., at £880, has been accepted; additions to the three-phase distributing mains, at a cost of £9,000, and additional plant at the power station costing £40,500. The latter is made up as follows:—Two new boilers, economisers, extension of elevator, and new chimney, £15,000; one 1,000-kw. turbo-alternator, £24,000; piping and brickwork for two boilers, turbine bed, and switch-gear, £1,500. Also an electric jib crane is to be purchased from Messrs. E. Morley & Sons, at £350.

Dewsbury.—**RESTRICTED LIGHTING.**—The outcome of the elaborate scheme for controlling lighting, proposed by the Chamber of Trade, has been an intimation from the Home Secretary that, after careful consideration of the scheme, he has decided that he cannot amend the existing order.

Dukinfield.—**FIRE.**—Last week a fire occurred at the sub-station of the Joint Tramways and Electricity Board; the damage is estimated at about £200, and is covered by insurance. In order to effect repairs, the current had to be cut off, and was not fully restored until next day, with a serious result upon electrically-driven mills and business premises in Dukinfield and Hyde, whilst tramway traffic between Alma Bridge and Hyde was stopped for a time.

Fort William.—At a meeting of ratepayers it was agreed to petition against the water-power scheme of the British Aluminium Co., Kinlochleven.

Guiseley.—**PROV. ORDER.**—The Electrical Distribution of Yorkshire, Ltd., has given notice of its intention to apply for a prov. order to supply electricity within the townships of Guiseley and Menston. At the request of the D.C.'s concerned, a clause is to be inserted giving the local authorities the option of purchasing the undertaking at the end of a given period.

Hebden Bridge.—**PRICE INCREASE.**—The U.D.C. has decided in Committee to advance the electric lighting charges by 8½ per cent., and power charges by 20 per cent., from January 1st.

High Wycombe.—**STREET LIGHTING.**—The T.C. has agreed to enter into a new contract for public lighting with the local electricity company for seven years as from January 1st, 1916, the date of the existing dispute, subject to the company accepting £100 for the standing charge payment for 1916 instead of £600, as demanded. If this is accepted by the company, the present action now pending in the Courts will be stayed, each party paying its own costs. The terms of the contract are:—Fixed standing charge, £100 a year; 13 300-watt lamps, £4 each; 110 100-watt lamps (all night), £2 10s. each; 62 100-watt lamps (half night) £1 10s. each.

Hull.—**PRICE INCREASE.**—The Electricity Committee has decided to increase electricity charges on January 1st by ½d. per unit on the flat rate, making 18½ per cent. increase on pre-war rates, and by a further increase of 17½ per cent. on all other units, making 32½ per cent. on pre-war rates.

Keighley.—The Electricity Committee has prepared for submission to the Council a report on the question of increasing the capacity of the boiler-house plant at the generating station, and recommends a fan installation, at an estimated cost of £1,500.

Leeds.—**RESTRICTED LIGHTING.**—The Chamber of Trade's efforts—supported by all the shopkeepers' organisations of the West Riding—to persuade the Home Office to fix definite times, covering a period of a fortnight or a month, for reduced shop lighting during the winter, instead of the daily movable times governed by the sunset, has ended in a decision of the Home Office that, after consultation with the military authorities, it cannot sanction any alteration of the present system.

Leicester.—**PLANT EXTENSION.**—The T.C. has decided to apply to the B. of T. for a prov. order authorising the acquisition of land and the construction of a new generating station. The initial instalment of the scheme comprises machinery of 6,000-kw. capacity, and this, together with buildings and land, will involve an expenditure in the aggregate of £285,000, made up as follows:—Water-tube boiler plant, £36,000; turbines, £18,000; alternators and switchgear, £10,500; surface condensers, £7,500; water piping, circulating pumps, screens, &c., £10,500; buildings, coal and ash handling plant, and foundations, £54,000; contingencies, £13,500; other constructional works and land, £135,000. Alderman Flint, the chairman of the Tramways and Electricity Committee, said this was only an approximate estimate of the cost

of the first instalment of the scheme for the purposes of the Board of Trade, and would be subject to revision when a detailed scheme was brought before the Council for adoption. It was estimated, however, that the undertaking would not cost the ratepayers anything.

London.—The South London Electricity Supply Corporation has decided to increase the charges for power by 11 per cent.

Lancaster.—PRICE INCREASE.—It has been decided to increase the price of electricity by 25 per cent.; the increase takes effect in January.

Nottingham.—WAGES.—The Committee on Production has given its award on the recent arbitration with regard to the wages demand of Corporation (gas, tramways, electricity, health, &c.) employes, by the National Union of General Workers and the National Union of Tramway and Vehicle Workers. The advances granted by the award represent about £20,000 a year.

Southport.—PRICE INCREASE.—The Finance Committee of the T.C. recommends an increase of 5 per cent. in the charge for electricity.

Stoke-on-Trent.—PRICE INCREASE.—At the last meeting of the B.C. a recommendation of the Electricity Committee was approved in favour of a further advance of $6\frac{3}{4}$ per cent., making 40 per cent. in all, upon all supply and other charges payable to the Electricity Supply Department, to be charged upon the gross total of each account from and after the next meter readings in December. Ald. Leese, the chairman, pointed out that the increased price would just save the Committee from a loss if there were no further increase next year in the cost of production. They were now paying £11,000 a year more for coal and £3,000 in war bonuses to workmen.

Sunderland.—The Electricity Committee has refused a request of the County of Durham E.P. Distribution Co. for consent to the latter supplying energy to the Egis shipyard at Pallion (in the Corporation area of supply). The Committee decided not to entertain a proposal for interchange of energy between the Corporation and Newcastle-upon-Tyne Electric Supply Co. It was further announced, in view of statements to the contrary, that the Corporation undertaking was satisfactorily meeting all demands, and was prepared to negotiate for the supply of additional energy if required.

West Ham.—PRICE INCREASE.—The Electricity Committee recommends the following prices for electricity:—Lighting, 6d. per unit; factory, 3d.; maximum demand rate cancelled. Household tariff, £10 and 1d. per unit. Power and heat, 1 $\frac{3}{4}$ d. per unit. Heating (domestic), 10s. to 6s. 8d. and 1d. per unit. Arc lamps, 3 $\frac{1}{2}$ d.—3d. per unit. Discounts over £15, 2 $\frac{1}{2}$ per cent.; over £45, 5 per cent. Minimum charge for service, £1 per annum, or special charge if necessary.

TRAMWAY AND RAILWAY NOTES.

Accrington.—Pending a final settlement on the matter, it has been decided by the Electricity and Tramways Committee to charge the Haslingden Corporation 5d. per car-mile during the present year for the tramway service provided to the latter authority.

Grimsby.—Steps are being taken to improve the tramway service, the tramway manager having attended a meeting of the Committee, and made certain proposals with this end in view. The Committee has also considered the expiration of the Council's agreement with the company in 1921, and a Sub-Committee was to be appointed to deal with this matter.

Halifax.—RAILLESS TRACTION.—The Tramways Committee proposes to purchase two railless cars from the Dundee Corporation, at a cost of £625 each.

The Tramways Committee has agreed to the request of the Amalgamated Association of Tramway and Vehicle Workers that Christmas Day be an entire holiday for the whole staff.

Hull.—A report on the question of repairs and renewals of the electrical power plant, presented to the Tramways Committee, states that unless considerable risk is incurred by the Committee, the provision of additional power should not be long delayed. A spare armature ought to be purchased at a cost of £1,310, but sanction had been refused. The provision of a third generating set, which was a preferable course, would involve an expenditure of between £10,000 and £15,000. The report is to be fully considered at a special meeting of the Tramways Committee, when also the question of obtaining power from the electricity department will be debated.

Keighley.—INCREASED FARES.—The Tramways Committee recommends an increase in fares on trolley vehicles, to take effect from December 8th.

Lancashire.—CHRISTMAS DAY SERVICES.—The Rochdale Corporation tramway employes have decided to refuse to work on Christmas Day; their application for a holiday on that day had

been previously declined by the Tramways Committee. The men's decision is subject to confirmation by the Lancashire District Council of their Association. The men were informed at their meeting that a score of undertakings were closing down for a day's holiday this Christmas. Colne T.C. has declined to grant the request for a holiday, as also have Bolton and Burnley. In the last-named town the Christmas Day passengers during the past five years have averaged about 50,000.

The Oldham T.C. has decided to suspend its service on Christmas Day; the Salford tramway employes have decided by vote not to work on that day.

Newcastle-upon-Tyne.—The Corporation Tramways Committee has agreed to grant the men's request, and close the service down on Christmas Day.

Wigan.—Owing to the recent flooding of the River Douglas, the Wallgate depot was inundated, and the services of the fire brigade were requisitioned to pump out the water.

TELEGRAPH AND TELEPHONE NOTES.

France and the United States.—A wireless station is to be erected shortly by the Government on the west coast of France, to carry on continuous communication by day and night with the United States. It will emit continuous waves of at least 15,000 m. wave-length, and will be guaranteed to transmit 10,000 useful words per day on any day in the year. It will also be able to transmit and receive continuously at the minimum speed 4,000 words an hour, transmission and reception being carried on simultaneously and independently.—*Annales des Postes, Télégraphes, et Téléphones.*

South America.—The Central and South American Telegraph Co. has received a message from its agent at Rio de Janeiro, to the effect that the Brazilian Government has finally signed the contract for the extension of its all-American cables *via* Colon to Brazil, by cable from Buenos Ayres to Santos, and another cable from Buenos Ayres to Rio de Janeiro. These extensions will be carried out as soon as war conditions will permit.—*T. and T. Age.*

Telephonic Relays.—In *Annales des Postes, Télégraphes et Téléphones* an account is given of recent tests of telephonic relays between Paris and Marseilles, over a circuit of 3·5-mm. copper wire. The apparatus—a vacuum amplifier—was installed in the office at Lyons, and its use brought up the speaking efficiency of the circuit to equality with that of the two other Paris-Marseilles circuits, which consist of 5-mm. copper wire. The copper in the former weighs about half as much as in each of the latter circuits, and the difference (150 tons), at £160 a ton, would be worth £24,000.—*Journal Télégraphique.*

Wireless Schools.—Two thousand wireless operators are needed by the Government, and the Marconi Co. is arranging with the Portsmouth Education Authority to open classes.—*Daily Chronicle.*

CONTRACTS OPEN AND CLOSED.

OPEN.

Argentina.—February 23rd, 1918. Rosario Municipality. Establishment of telephone service within the municipal radius. Conditions on application.

Bolton.—January 15th. Electricity Committee. One 7,500-kw. turbo-alternator with condensing plant. See "Official Notices" to-day.

Great and Little Usworth.—Work in connection with electric lamps belonging to the Parish Council. Mr. J. Elliott, clerk to the Council, Fern House, New Washington, Co. Durham

Manchester.—December 12th. Three fan draught cooling towers at the Stuart Street station, for the Electricity Committee. See "Official Notices," November 16th.

CLOSED.

Derby.—T.C. Coal elevator for the electricity works: P. Fletcher & Co., £880. Electric jib crane: E. Morley & Sons, £350. Electric omnibus and chassis: Edison Accumulators, Ltd., £1,923.

Faversham.—T.C. About 300 tons of coal for the electricity works: Francis Davis, 4s. per cwt.

London.—STEPNEY.—Electricity Committee. Accepted tenders: Messrs. E. Foster & Co., 2,000 tons West Cannock nutty slack, at 22s. 10d. a ton; 3,000 tons 1st stock D.S. nuts, 23s. 2d. a ton; 5,200 tons Walsall Wood Beans, 21s. 1d. a ton; 3,000 tons Hawkin's Cannock nutty slack, at 23s. 4d. a ton.

Salford.—The E.C. recommends the acceptance of the tender of Messrs. W. T. Glover & Co., Ltd., for paper-insulated lead-covered cable, required in connection with the supply of electricity to the premises of Messrs. P. R. Jackson & Co., Ltd., in Hampson Street, Salford, for £570.

Sutton.—U.D.C. Ten-line intercommunication telephone instruments: Messrs. Stuart & Moore, Ltd., £67.

Weymouth.—The T.C. has agreed to sell to Messrs. Banks, Warner & Co., a 150-kw. Diesel engine, at the electricity works, for £1,300, and to purchase from Loughborough a 350-kw. steam set for £956. This is on account of the prohibitive price of fuel oil.

FORTHCOMING EVENTS.

Junior Institution of Engineers.—Friday, December 7th. At 8 p.m. At 39, Victoria Street, S.W. Paper on "Maintenance of Engineering Plant," by Mr. J. G. Moon.

Chief Technical Assistants' Association.—Saturday, December 8th. At 3 o'clock. At the Tavistock Hotel. Paper on "Motor Converters & Motor Generators," by Mr. Baron.

North of England Institute of Mining and Mechanical Engineers.—Saturday, December 8th. At 2 o'clock. At the Wood Memorial Hall, Newcastle-on-Tyne. General meeting.

Birmingham and District Electric Club.—Saturday, December 8th. At 7 p.m. At the Swan Hotel, New Street. Annual meeting.

Association of Engineering and Shipbuilding Draughtsmen (London Branch).—First Bohemian Concert. Saturday, December 8th. At 7 p.m. At the Caledonian Salon, Holborn Restaurant.

Royal Society of Arts. John Street, Adelphi, W.C. Monday, December 10th. At 4.30 p.m. Cantor Lecture, "Progress in the Metallurgy of Copper." (Lecture II) by Prof. H. C. H. Carpenter, F.R.S.

Wednesday, December 12th. At 4.30 p.m. Paper on "Technical Training for Disabled Soldiers and Sailors," by Lord Charnwood.

Thursday, December 14th. At 4.15 p.m. Paper on "The Trade of India with Russia, France and Italy," by Mr. D. T. Chadwick.

Association of Supervising Electricians.—Tuesday, December 11th. At 7.15 p.m. At St. Bride's Institute, E.C. Paper on "Some Notes on Transformers," by Mr. A. J. Cridge.

Faraday Society.—Wednesday, December 12th. At Burlington House, Piccadilly, W. At 7.50 p.m. Annual general meeting.

Association of Engineers-in-Charge.—Wednesday, December 12th. At 8 p.m. At St. Bride's Institute, E.C. Paper on "Some Phases of Modern Industrialism," by Mr. A. W. Wyatt.

Institution of Electrical Engineers.—Thursday, December 13th. At 6 p.m. At the Institution of Civil Engineers, Great George Street, S.W. Discussion on "The Metric System," with introductory papers by Mr. L. B. Atkinson and Mr. A. J. Stahls.

(Manchester Local Section).—Tuesday, December 11th. At 7 p.m. At the Engineers' Club. Paper on "Electrical Cooking as applied to Large Kitchens," by Mr. W. A. Gillott.

(Scottish Local Section).—Tuesday, December 11th. At 7.30 p.m. At 207, Bath Street, Glasgow. Paper on "Gas Firing Boilers," by Mr. T. M. Hunter.

(Students Section).—Tuesday, December 11th. At King's College, Strand, W.C. At 7 p.m. Discussion on "Recent Applications of Electricity."

Institution of Mechanical Engineers.—Friday, December 14th. At 6 p.m. At the Institution of Civil Engineers, Great George Street, S.W. Paper on "The Use of Soap Films in Solving Torsion Problems," by Mr. A. A. Griffith and Mr. G. I. Taylor.

Electro-Harmonic Society.—Friday, December 14th. At 8 p.m. At the Holborn Restaurant (Venetian Chamber). Smoking Concert.

Greenock Electrical Society.—Saturday, December 15th. Visit to Glasgow Central Station.

Association of Mining Electrical Engineers (West of Scotland Branch).—Saturday, December 15th. At 3 p.m. Visit to Messrs. Mavor and Coulson's Works, Glasgow. Concert at Trades House Restaurant, 89, Glassford Street.

Society of Engineers.—Monday, December 17th. At 5 p.m. At the rooms of the Geological Society, Burlington House, Piccadilly, W. Lecture by Mr. Chalmers Kearney on "High-speed Railways after the War" (postponed from December 3rd).

NOTES.

The Filiform Crystal and its Use in the Glow Lamp.

Before a recent meeting of the German Illuminating Engineering Society, reported in the *E.T.Z.* of October 28th, 1917, F. Schröter gave some particulars of the process adopted by Julius Pintsch & Co., for producing a continuous tungsten crystal which is used in place of the ordinary drawn wire for glow lamps. As is well known to investigators, metals when worked mechanically undergo certain structural alterations, the crystal grains forming the structure being displaced in certain directions. The change is accelerated by the application of heat. The return to the stable condition, when the normal crystalline structure again predominates, is known as recrystallisation.

In the case of the glow lamp we have a typical example of the "fatigue" of a metal with high temperature. A drawn tungsten wire, which in the initial cold state has a structure made up of parallel fibres and therefore possesses great elasticity, shows, when submitted to a microscopical examination after burning at a temperature of 2,300° C., the reformation of the irregularly distributed individual crystals. At the temperature of the half-watt lamp, viz., 2,700° C., recrystallisation is visible after a few minutes. When recrystallisation is complete the most valuable properties (extensibility and flexibility) which the drawing process has imparted to the tungsten wire, disappear.

The object of the new Pintsch process is to obtain glow lamps which shall have anti-vibration filaments both in the cold and hot state. Filaments were first produced by the squirted (not drawn)

process, with the addition of about 2 per cent. of thorium oxide. In certain places on the filament the wires were much more flexible than pure tungsten wire; but at irregular intervals they were brittle even when errors of manufacture were avoided. The first deciding factor in the modified process was the fact that individual crystals occur red, these crystals going to make up the filament. The problem has been solved by taking a wire, containing thorium oxide, and obtained by the squirted process, and heating as short a length as possible at 2,400° C., quickly raising this temperature to 2,600° C., and moving the wire through the heating apparatus at a velocity somewhat lower than the velocity of propagation of the crystallisation process.

Fresh sections of the wire are continually being exposed to the high temperature region, and the process is continued until the entire length of the filament is overgrown by the crystal. This "forming" process is carried out in a hydrogen atmosphere owing to the tendency of tungsten to oxidise. The wire, as it leaves the forming apparatus, is incorporated into the lamp without further treatment.

The main feature of the process is that the structure of the tungsten filament is that of one continuous crystal instead of being composed of a number of single crystals unequally distributed.

Practical tests that have been made show the superiority of the filiform tungsten crystal for the purposes for which it is intended, owing to the stability of its structure at high temperature and its mechanical properties. Its tensile strength, viz., 164 kilogrammes per square millimetre, is higher than that of steel wire, although less than that of drawn tungsten wire. The crystal filament is so malleable that it can be wound round the smallest mandrel, and it maintains this property even after burning for an extended period. Owing to the small percentage of thorium oxide included, the radiant properties of the crystal filament are pretty much the same as those for pure tungsten wire.

A Substitute for the Leclanché Cell.—In a communication in the September—October number of the *Bulletin de la Société d'Encouragement pour l'Industrie Nationale*, Prof. Féry describes a new type of wet primary cell that he has elaborated. The Leclanché cell, depolarised by manganese dioxide (which used to be obtained from Germany) is the most common type at the present day. Prof. Féry conceived the idea of doing without manganese dioxide and depolarising the cell with the oxygen of the air. Hitherto attempts in this direction had not met with much success owing to the zinc electrode being vertical in position, giving rise to certain disadvantages, viz.:—

1. The zinc easily oxidised—absorbs oxygen as it dissolves, which is liberated on the surface of the liquid, so that the carbon immersed in the deoxidised liquid is polarised when the circuit is closed.

2. The surface action of the aerated liquid on the zinc tends to corrode the electrode where it is immersed in the liquid.

3. The oxy-salts of zinc thus formed in the mass have a tendency to cause "creeping" of the salts.

4. The crystals of oxychloride of zinc and ammonia due to this reaction, attack the zinc and the carbon and decrease the active surface of the electrodes.

5. This continuous action of the oxygen dissolved in the liquid on the zinc electrode causes a local attack which tends to increase out of all proportion to the theoretical consumption.

To overcome these defects, and use the air as the depolariser, the author has given the zinc electrode the form of a horizontal plate placed at the bottom of the cell. The carbon electrode is vertical, being separated from the zinc by a thin sheet of felt or an ebonite cross piece.

Local action in a cell of this type is practically eliminated, and the quantity of zinc dissolved is 1.24 grammes per ampere-hour. The voltage on open circuit is 1.18.

Certain continuous tests have been made on cells of this type and the results are given in a table accompanying the original paper.

In comparative tests carried out by one of the French railway companies on four of the new cells and four Leclanché cells, after eight months of continuous operation on a resistance of 700 ohms, the manganese (Leclanché type) cells had used up two zinc rods each weighing 150 gm., while the new cells had only used one zinc sheet weighing 120 gm. A cell of the new type capable of yielding 90 ampere-hours weighs only 21 kg. (about 46 lb.). It is possible to obtain this output of 90 ampere-hours with 100 gm. of sal-ammoniac, the concentration of the solution being 12 per cent.

A brief account of this cell, with a drawing, was given in our issue of August 10th, 1917, p. 129.

German Economy in Lubrication.—It is now some time since a German committee appointed to consider the matter issued a report making numerous recommendations with a view to eliminating waste in lubrication. In recognition of the fact that it is seldom possible to get individual workpeople to add to their other duties, a live interest in and effective application of the principles of economy in lubrication, a number of German works now make one person definitely responsible for the sufficient yet economical lubrication of a certain number of machines. It is this person's duty to lubricate the machines once or more in each 21 hours as may be necessary; and he or she is trained to use as little oil as effectively as possible. The "lubricator" has also to collect oily waste and oil collected in drip pans, &c. Each machine operator is given a small emergency supply of oil and is held strictly accountable for this. It is said that these measures resulted in 40 per cent. reduction in the oil consumption of a certain works where it was thought that the consumption had already been reduced to a minimum.

National Service for Small Engineering Works.—A Conference, convened by the Aeronautical Institute, of smaller engineering firms not fully engaged on war work, and capable of undertaking work in connection with aircraft production, took place on November 29th, with Mr. A. J. Liversedge in the chair. The Conference was attended by several hundred representatives from all over the country. The Institute proposes to help the small manufacturer by instituting one or more centres where samples of any parts can be seen in different stages of manufacture; by providing newcomers with full information and technical assistance concerning the making of any parts they may undertake to do; and by putting at their disposal jigs, &c., that have in practice proved successful and accurate. The small manufacturer can produce parts at a low cost only if he be given standing repetition work for two or three parts suitable to his plant and labour; and this repetition work can be obtained only if all the smaller firms interested act together as one big concern, and each individual firm produces in quantities its quota; therefore, one or more centres should be established at which the Government could deliver in bulk, for re-distribution among the members of the proposed body by a Committee of the body itself, and one or more centres should be established to which all finished articles would be sent for inspection in bulk by Government inspectors. A resolution was carried approving of the proposals of the Institute, and appointing a Committee to carry them into effect.

Volunteer Notes.—COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).—Headquarters, Balderton Street, Oxford Street, W. 1.

Orders for the week, by Lieut.-Colonel C.B. Clay, V.D., commanding:—
Officer for the Week.—Second Lieut. P. Bowden.
Drills.—Week ending Sunday, December 16th, 1917:—
 Monday.—No. 3 Company, Left Half. Recruits, signalling, 6.30.
 Tuesday.—Physical drill and bayonet training, 7.30.
 Wednesday.—No. 1 Company, 6.30.
 Thursday.—No. 2 Company, 6; signalling, ambulance, 6.30.
 Friday.—No. 3 Company, Right Half. Recruits, 6.30.
 Sunday.—Commandant's parade for instruction in camp arrangements at Esher. Parade, Waterloo Station, opposite No. 10 Platform, 8.30 a.m. Uniform.
Musketry.—Belvedere Road, Tuesday, Wednesday, and Thursday, 6 to 8.
Note.—The Medical Officer will attend for examination of recruits, &c., on Thursday, at 6.30.

(By order) MACLEOD YEARSLEY, Capt. and Adjutant.

Municipal Tramways Association and B. of T. Tramways Committee.—Several municipalities, both north and south of the Tweed, are very much concerned in regard to the powers of the new National Tramways Committee, which has been appointed by the Board of Trade to consider the needs of the various municipal and company tramway undertakings throughout the country, and, if necessary, to close down the less essential concerns. At the meeting of the Executive Council of the Municipal Tramways Association, which was called to consider the question, Mr. Dalrymple, of Glasgow, moved the following amendment, which was seconded by Alderman Flint, of Leicester, who is president of the Association:—"That this Council take no further action on the letter received from the Board of Trade on the question of the expert Committee in respect of materials and labour on tramways, but that the whole question of policy and personnel be referred to a general meeting of the Association to be called forthwith." The motion to proceed with the appointment of the representatives on the National Committee was, however, carried. Steps are being taken to put before the President of the Board of Trade the desirability of having a member on the Committee who will represent the tramway undertakings in Scotland.

The British Fire Prevention Committee.—The British Fire Prevention Committee was formed in 1897, and has now completed the twentieth year of its activities. The Committee's testing station, where the experiments and tests are carried out, and which is such an important part of its work is at North Bank Lodge, Regent's Park. The offices of the Committee are at No. 8, Waterloo Place. Generally speaking, the Committee's work has comprised extensive research work, including many tests; the initiation of questions of legislation, bye-laws, regulations, &c., with the necessary presentation of data and "evidence," and the issue of extensive literature on the subject of fire prevention and extinction, known as the Committee's "Red Books" and "Journals"; the preparation of a number of notices and circulars of a precautionary character, the collection and exchange of technical information and its dissemination from the Committee's inquiry office; the organisation of conferences and technical exhibitions, and, finally, a general propaganda through the Press and elsewhere in the interests of fire prevention.

The most competent authorities in the United States, France, and Russia have been liberal in their praise, whilst authorities in enemy countries, in pre-war days, adopted the Committee's data, and the conclusions drawn from its investigations. In the pre-war period, although the Committee's research work was carried on voluntarily and with limited funds, it was far superior to anything that obtained in Germany or Austria regardless of State aid.

It has not been the ambition of the Committee to court public notice; it has taken as its model the policy of some of the best-managed Government Departments, which is to work unostentatiously for the benefit of the public generally. It has found that by quiet and steady work useful results are more effectively obtained than by the clamour of public meetings and other ostentatious methods. The Government of the day has invariably supported the Committee's endeavours, and every Government Department has rendered the Committee such assistance to achieve its object in the public interest as was in its power.

The Committee has kept largely to facts, and avoided the expres-

sion of opinion on subjects of a controversial character, whilst the presentation of facts, as a rule, sufficed to show the reason for the Committee's endeavours.

Lastly, the work within the Committee has been of an harmonious character throughout, and this collaboration has led to the closest friendship between many individual workers. The organisation of the work allows for decentralisation and the allotment of tasks to those specifically conversant with the technical issues involved, and the amount of sustained technical effort and care given by the Committee's workers engaged upon individual problems has been remarkable; in fact, the Committee's reputation for thoroughness and exactitude has been largely based on their generous and painstaking work and voluntary service.

The past 20 years of the Committee's work have demonstrated that, regardless of the opposition of vested and other interests, considerable progress has been achieved, and that the results have been valuable to the citizen and to the State, both from the humanitarian and the economic point of view. We congratulate the Committee on its admirable record of public service, and trust that in the more enlightened future that, we hope, lies before us, its efforts will be still more fully appreciated and effectively aided by the people of this country and their Government.

Graphite in Madagascar.—In an article by Mr. John W. Shelley, of the Madagascar Service des Mines, which appeared in the *Mining Magazine*, some interesting particulars relating to the growing graphite industry in Madagascar were given. The deposits extend for a distance of 400 miles, and so far only the outcrops have been worked. The bulk of the graphite is in the form of thin flakes from $\frac{1}{4}$ in. diameter down to fine dust, the amorphous variety being rare: as dug out the ore contains 60 per cent. graphite, but only a third of this is recovered by present methods of dressing. Of this 60 per cent., containing 90-96 per cent. carbon, is suitable for crucibles and furnace linings, while the remainder (fine dust) is used for other purposes. Some deposits contain a large mixture of mica and iron, and await the development of a satisfactory separation process. The deposits are worked by native labour employing their own crude methods of hand washing, &c., and Mr. Shelley suggests that the staff, that is at present producing 25 tons of marketable graphite could with labour-saving devices secure 250 tons. The working cost at the mine averages £9 a ton, and with inland transport, shipping, taxes, &c., added, the total cost amounts to £17-£19 per ton c.i.f. London, under normal conditions.

In 1913 about 120,000 tons of graphite of all kinds represented the world's production. Ceylon produced 40,000 tons and Madagascar 8,000 tons, though the 1915 production of the latter was estimated at 12,000 tons. The graphite exports of Madagascar have risen to the latter figure from 19 tons in 1909. The production is exported to Europe, and used: 60 per cent. for crucible retorts, 15 per cent. for furnace and converter linings, 10 per cent. for paint, 10 per cent. for lubricant, and 5 per cent. for foundry moulding.

Mr. Shelley draws attention to the great possibilities awaiting the development of the graphite industry in Madagascar.

War Taxation on Electrical Energy in Russia.—The Minister of Trade and Industry has drawn up his conclusions on the proposed tax on electrical energy, and states that the project of the Ministry of Finance which has not been hitherto given effect to, comes into prominence again owing to the necessity of seeking new sources of revenue for the Government.

In the opinion of the Minister quoted there ought to be a distinction between the assessment of electrical energy used for lighting and heating, and of that for motive power. That the tax on lighting current should fall entirely on the one obtaining the corresponding advantages is, in his opinion, perfectly fair; but it is quite different with the electric current used for motive power. The encouragement to change over from the more ancient to the more modern methods of production and consumption of motive power is one of the first calls on the economic policy of the Government. The assessment of electrical energy used for as motive power is now quite inadmissible, and can only be applied on condition of the assessment of all kinds of power current generally. In conformity with these considerations the Board of Electrico-Technical Business has prepared a new project of taxation for electrical energy. All electrical current used for lighting and also used for other purposes, if obtained from lighting current mains, unless measured by special meter, is subject to taxation. Electric current used for lighting entertainment establishments, cinematographs, cafés, restaurants, clubs, and all kinds of illuminated advertisements, are to be separated into a special category and subjected to a maximum tariff. Electrical current used for Government establishments, Treasury premises, and concerns for lighting the rolling stock of private railways, and private marine and river ships will not be subject to taxation. The object of the new project is first of all to tax the consumption of electrical energy and not its production. Therefore the tax is to be paid to the Treasury by the owners of electric stations on account of the consumers. The owners of stations in settling their accounts with their subscribers may include the amount of the tax falling on them according to the quantity of useful energy delivered, whilst compensation is permitted also in cases where the payment taken for current along with the amount calculated for the tax, exceeds the selling rate fixed for electrical energy by the local town or county Governments. As the tax on electrical energy is a temporary measure, it will be suppressed when the present serious financial crisis is past. The tax may be at so much per cent. on the selling price of current, or per arc or incandescent lamp.

Institution and Lecture Notes.—Institution of Civil Engineers.—A paper was read, on December 4th, on "Recent Developments in By-Product Coking," by Mr. G. B. Walker. The author described the principal features of half a dozen of the most successful types of oven in use in this country and the recovery plants associated with them, and compared the relative value of the surplus gases used in producing steam (utilised through turbines) and in internal-combustion engines, to the advantage of the latter.

Association of Mining Electrical Engineers.—In the course of his presidential address to the East of Scotland Branch of the Association, Mr. Richard Kirkby, general mining manager of the Wemyss Collieries, stated that the total h.p. of electric plant in use in the coal mines of Great Britain in the year 1913 was 628,097. In 1914 the total h.p. had increased to 713,782, a gain of fully 13½ per cent. Owing to the war the figures for 1915-16 had not been published. In 1914 hauling used 28½ per cent. of the total plant h.p. of electricity, pumping 27 per cent., and coal-cutting 5½ per cent. He did not favour driving every machine in or about a mine by electricity; there was no doubt that thousands of horses and ponies could be replaced by small electrically-driven rope haulages, and the field for electrically-driven coal cutters was still open for competition by makers who had done very well during the last few years in the way of improving their machines.

Diesel Engine Users' Association.—At the November meeting of the Association, the President (Mr. Geoffrey Porter) reported that the Standing Committee on Insurance Against Breakdown were drafting by-laws to regulate its procedure and to deal with differences that might arise between the underwriters and policyholders in the interpretation of the Standard Policy, &c. The recent order of the Ministry of Munitions regulating supplies of tar oil for use as fuel in Diesel engines was considered and discussed. Comment was made on the condition in the schedule that acceptance of the producers' weights and measurements in selling tar oil should be compulsory on the purchaser. It was reported that the Controller of the Mineral Oil Production Department of the Ministry of Munitions was arranging for trials of mixtures of pitch and creosote to be carried out, with a view to their adoption for use as fuel for Diesel engines. The hope was expressed by the meeting that actual users of Diesel engines under normal working conditions would be given an opportunity of thoroughly testing any such fuel and reporting thereon, before any final decision was arrived at by the Controller as to its suitability. Mr. George W. F. Horner read some notes on "The Lubrication of Air Compressors." A communication from Mr. J. Veitch Wilson on the subject of "Lubrication of Air Compressors and Diesel Engines" was also read. An interesting discussion followed, and will be reported at a later date.

Institute of Marine Engineers (Inc.).—In the course of a paper on "Aids to Prevent a Ship from Sinking," read on November 13th, Mr. C. V. A. Eley advocated the provision of ample pumping capacity to clear out the water as fast as it entered a damaged compartment. This could be effected by providing sufficiently large suction pipes from the bilge to the centrifugal circulating pumps, and by fitting the electric lighting engines with centrifugal pumps. In his own system, he used direct pumping plant with central means of indicating the position and extent of the damage and of controlling the pumps. The discussion was adjourned to December 11th.

Chadwick Public Lectures, Leicester.—The third of the Chadwick Lectures on "Electricity and National Welfare" was given at the Museum, Leicester, by Prof. H. T. Davidge, on Saturday, December 1st, the special subject dealt with being "Electricity and the Hygiene of the Body." The lecturer stated that we were much in the dark as to the action of electricity upon the body, but certain purely physical and chemical results caused by the passage of a current through living beings were well established. He then dealt with electric shock, the use of X-rays for examination and curative treatment, the principles and uses of ionic medication, the brush discharge, and electric baths, and applications of electricity and magnetism to the removal of foreign bodies from wounds, and finally an elementary treatment of the properties and uses of radium for medical purposes was given.

Royal Society.—At the meeting, on Friday last, Sir Joseph J. Thomson was elected president. The treasurer and other officers were elected in accordance with the list published in our issue of November 9th.

President Wilson's Speech.—In the course of his speech delivered to the U.S. Congress, on Tuesday, President Wilson, in referring to necessary new legislative and other war measures, said:—"It is imperatively necessary that the consideration of the full use of the water power of the country, and also the consideration of the systematic, and yet economical, development of such of the natural resources of the country as are still under the control of the Federal Government, should be immediately resumed, and affirmatively and constructively dealt with at the earliest possible moment. The present need of such legislation is daily becoming more obvious. The legislation proposed at the last session with regard to regulated combinations among our exporters, in order to provide for our foreign trade a more effective organisation and method of co-operation, ought by all means to be completed at this session."

Mine Electricians' Exemptions.—Under arrangement with the Miners' Federations, all certificates of exemption issued on grounds of employment to electricians of military age employed at coal mines who entered the coal mining industry after August 14th, 1911, and were of military age at that date, have been withdrawn.

"Natural Steam" Electric Generating Plant in Italy.—In the volcanic areas of the Province of Tuscany (Italy) there are numerous hot springs from which immense columns of steam issue. In the current (September) number of *La Science et la Vie*, the electrical engineer of the company (Società Boraefera di Lardarello) which has been formed with a view to the practical utilisation of this natural steam, discusses the methods adopted for this purpose. Boreholes are made at suitably selected places in order to collect the steam, and are lined with cast-iron. The steam cannot be used direct for power raising owing to the presence of incondensable gases. Use is made of a series of evaporators, consisting of nests of tubes in a special vessel. The subterranean steam is led into this vessel, and heats the water contained in the tubes. The pressure of the natural steam is about 40 lb./sq. in., and of the steam in the tubes about 30 lb. The steam turbine, constructed for a pressure of about 24 lb./sq. in., runs at 3,000 R.P.M.; it is coupled to a three-phase, 250-kw. alternator, working at 50 cycles and 4,000 volts. The current is stepped up to 16,000 volts, and is fed to an aluminium transmission line feeding an area of about 25 miles. It supplies energy to the town of Volterra and to various factories in the vicinity. For factory purposes the pressure is stepped down to 220 volts. This plant started working in 1913, and is giving entire satisfaction.

This first installation led the promoter to consider the construction of a higher-powered plant, which was brought into use in 1916. The war naturally caused difficulties in obtaining delivery of the necessary plant, which increases to 7,500 kw. the capacity of the new station. A French firm was given the task of designing the evaporators for producing the pure steam for working the turbines. They may best be compared to a multi-tubular boiler, in which the flame surrounds the tubes. The new station comprises 16 evaporators, to be soon supplemented by six others, each capable of generating 6,000 kg. (13,500 lb.) of pure steam per hour, at an effective pressure of about 8 lb./sq. in. The natural steam arrives at a pressure of 14.7 lb./sq. in., and condenses in the chamber surrounding the tubes. It is impossible to eliminate the sulphur dioxide mixed with the steam from the "soffioni" (as the natural steam jets are called), so that the tubes in the boiler have had to be made of aluminium to prevent incrustation.

Finally the pure steam produced in the evaporators is led into the turbines after having been superheated by a further supply of natural steam.

Three turbo-generator groups have been installed, each of which has an effective output of 2,500 kw. The turbines are of the reaction type, and work at an effective pressure of 0.25 atm. (3.6 lb./sq. in.) at 3,000 R.P.M., and each consumes about 30,000 kg. (66,000 lb.) of steam per hour.

The turbine condensers are of the surface type. Pumps of 350 h.p. for each machine circulate the water for cooling the condenser tubes: they deliver 1,200 cb. metres (42,378 cb. ft.) per hour.

The turbines are coupled to three-phase, 3,000-kw., alternators, supplying current at 4,000 volts, 50 cycles. The pressure is raised to 36,000 volts for distribution.

The transformer house contains four three-phase transformers, each of 2,850 k.v.a., and two others of 4,000 k.v.a. will shortly be installed. The pressure can easily be stepped up to 40,000 volts.

The company mentioned above owns other "soffioni" (hot springs), which contain a less proportion of corrosive gases, and experiments will be made with a view to utilising the natural steam direct, thus obtaining greater efficiency.

Trade Matters Before Parliament.—In the House of Commons, on Monday, Sir Albert Stanley, President of the Board of Trade, moved the second reading of the Non-Ferrous Metal Industry Bill. The rejection of the Bill was moved and seconded. In reply to discussion, Dr. Addison showed that the Bill involved questions of national safety and the increased development of essential raw materials. He showed how for 18 months the Ministry of Munitions were trying to escape from the toils of the German monopoly. Without such powers as the Bill would give it would be practically impossible to form any competing organisation. The discussion stood adjourned.

The Import and Export Control Bill, which proposes the exercise of its powers for three years after the war, is understood to be meeting with strong objections from commercial interests in the House, and the Government may reduce the period to one year.

The *Daily Chronicle* Parliamentary Correspondent states that the final report of Lord Balfour of Burleigh's Committee on Trade Policy will be published in the course of a few days. It is understood that its principal recommendation will be the imposition of a general tariff on all imports, with the exception of food commodities. "The import duty proposed is 10 per cent. *ad val.*" This would be reduced by negotiation to those countries who gave British goods reciprocal treatment. Presumably imports from the Dominions and India would be admitted free."

Holt v. A.E.G. Electric Co., Ltd.—On Tuesday, in the Chancery Division, Mr. Arthur Holt, formerly London manager of the A.E.G. Electric Co., Ltd., claimed for a liquidated sum representing salary up to the end of November 30th, 1918, the date when he calculated the war would end. Plaintiff, who is with the Forces at the Front, claimed damages by reason of the fact that the contract for his services had been determined since the company had been ordered to be wound up by the Board of Trade. It was stated for the Board of Trade that they thought that directions should be given to the Controller to make a payment in settlement of the claim, but a decision was asked for on the point as to whether the action would lie against the company. Mr. Justice Younger said he would give a written judgment.

The I.M.E.A. and Station Engineers.—A circular letter has been sent out by the hon. secretary, Incorporated Municipal Electrical Association, drawing attention to (a) the position of electrical undertakers as regards the difficulty of retaining the services of their technical assistants; (b) the tendency in the past to underpay engineering assistants; and (c) recommending, as a first step, that the bonus awarded by the Committee on Production should be paid (where this has not already been paid) to all members of the staff, and suggesting that the general question of remuneration of the technical staff should receive the earliest possible attention.

Gas Traction Committee.—It is officially announced that the Government has appointed a Committee to consider and report on matters arising from the substitution of gas for petrol, &c., as a source of power, especially in motor vehicles. We note that Mr. Shrapnell Smith, who occupies the position, amongst others, of vice-chairman of the Electric Vehicle Committee of Great Britain, is to act as secretary for the time being.

P.O. Tube Railway.—The Board of Trade has extended by one year the time for the completion of the P.O. (London) Railway authorised by the Act of 1913.

Meter Accuracy on Arc Furnace Loads.—In electric arc furnaces used in making high-grade steel, the current wave shape is at times greatly distorted. A member of the Committee on Meters of the Technical and Hydro-Electric Section of the National Electric Light Association reports that the accuracy of an induction meter on this service was questioned because the magnetic and electrical characteristics of iron vary somewhat with the shape of the current wave. On account of the rapidly fluctuating load, indicating instruments could not be used; dynamometer type watt-hour meters without any iron in their magnetic circuits were specially compensated for inductive loads and used as standards, and the readings of the induction type watt-hour meter compared therewith. The meters were installed on the secondaries of current and voltage transformers. A large number of tests were taken under various conditions of furnace operation, and the dynamometer and induction type meters agreed to within 1 per cent. The instrument transformers were tested by the Electrical Testing Laboratories under artificially distorted wave forms, and were found to be accurate. The laboratory wave forms were not quite as irregular as the actual furnace current waves, but were severely distorted, and as they produced no appreciable effect on the transformer accuracy it was assumed that the effect of the slightly greater irregularity in the furnace wave would be negligible. It was concluded that under the conditions existing in this installation the accuracy of registration of the customer's meter was well within commercial limits, and was not seriously affected by the irregular wave form.

It is important to note that in the furnace electrode circuits considerable direct current was present, due probably to rectification in the arc, and consequently the current wave shape was unsymmetrical with respect to the zero line. The general shape of the wave was such as would be produced by superposing direct current on alternating current, and it was found that current transformers had large errors on this type of wave. If, therefore, the customer's meter had been placed in the secondary circuit of the supply transformers, instead of in the primary, serious errors in registration would probably have resulted. Pending further investigation, it is therefore recommended by this Committee that if arc furnace loads are metered on the secondary side of the supply transformers, the accuracy of the metering should be investigated. If metered on the primary side of the supply transformers errors will be avoided, as the direct current in the electrode circuits cannot reappear on the primary side, hence the primary current wave is symmetrical with respect to the zero line. Summing up the results, it appears that no serious error is produced by an irregular current wave form; but if the wave is unsymmetrical with respect to the zero line, considerable error may occur.—*Metallurgical and Chemical Engineering.*

Russian Electricity Supply.—RIGHT TO VARY AGREEMENTS.—The dearness of materials and labour, says a semi-official journal, has made it necessary to increase the price of finished products in Russia, even in cases under Government control. This applies particularly to electrical concerns that are bound by concession agreements with the towns. The normal solution of this would appear to lie in a review of the concession agreements. Experience, however, has shown that agreements cannot always be arrived at between towns and concessionaires, and in the cases of losing concerns such have been looked upon as in a condition facilitating the earliest possible transfer of such concerns to the control of the towns on an advantageous basis to the latter. On the other hand, the contractors have not always shown an inclination to review their agreements on the basis of safeguarding the interests of the towns. The fear of a disaster to the electrical industry, which threatened to leave the towns and industry without electric light and power, prompted the Ministry of Trade and Industry to inquire into the matter and to seek means for the protection of the electrical industry. The Ministry of Trade and Industry found a ready support in the Ministry of Foreign Affairs, which, being interested in the fate of foreign capital, particularly Belgian, invested in the electrical industry, brought the question to the notice of the Provisional Government. As the result of a conference a project was prepared for varying the agreements as to the delivery of current by the public electricity stations. This project embraces the following conditions:—

All stations for public use are permitted to raise the tariffs for

energy inscribed in the concession agreements, as well as tariffs according to separate agreements within the limits of the maximum fixed by decree. An explanatory notification of the increase is to be delivered to the respective towns; but if an agreement is not reached in a month the new tariff announced is to come automatically into force from the date of the delivery of the declaration; whilst the town will only have the right until the expiration of six weeks from the date of the delivery of the notification to oppose such increase at the Ministry of Trade and Industry, which, after deliberation, will decide the question finally.

If the increase in the tariffs should raise the net profits over 9 per cent., the surplus is to be divided between the Government (90 per cent.) and the town (10 per cent.), whilst the superintendence rests with the Ministry of Finance, which may inspect and revise the books and business methods of the interested concerns. The decree is to remain in force until December 31st 1918.

The project referred to will no doubt decide the question in a radical form. If it comes into existence the electrical industry will be completely freed from the possibility of any efforts of the towns to influence their activity in any way. This would be attained at too high a price; namely, by the complete destruction of the rights and contempt of the interests of the towns. Such a solution goes far further than the object immediately aimed at by the decree.

An Institution of Electrical Station Engineers.—On Wednesday evening a meeting was held at St. Bride's Institute to discuss the reconstitution of the A.E.S.E. on the new basis formulated at the Hammersmith meeting. Mr. H. W. Healy, president of the London Committee of the A.E.S.E. and hon. secretary of the Provisional Committee, occupied the chair, and opened the proceedings with an explanatory statement regarding the purpose of the reconstitution and the object of holding the meeting.

Mr. W. A. Jones, hon. secretary of the A.E.S.E., then read a report on progress to date, and Mr. G. C. Law, of Barnes, delivered an admirable address on the functions of the electricity supply engineer, the ideals at which he should aim, and the status to which he was justly entitled. The chairman then threw the matter open for discussion, and answered a number of questions which were put to him by members of the audience. There was a very large attendance, numbering perhaps 120, and some useful suggestions were put forward. Much interest was shown in the question of qualifications for membership, and it was urged that the Association should secure the support of the senior men before enrolling the juniors, instead of adopting the reverse procedure, as at present.

The Electro-Harmonic Society.—The next smoking concert will be held at the Holborn Restaurant, in the Venetian Chamber, on Friday, December 14th, commencing at 8 p.m. Mr. H. Scholey will preside. Artists: Mr. Philip Ritte, tenor; Mr. George Baker, baritone; Mr. Oily Oakley, banjo soloist; Mr. Arthur Melrose, comedian; Mr. Reginald Wishart, illusionist; Mr. Warwick Pryce, musical sketches at the piano; Mr. Bernard Flanders, A.R.A.M., solo pianoforte and accompanist.

Wages in Metropolitan Electricity Works.—The Marylebone Electricity Committee, reporting to the Council with regard to the recent conference of electrical supply companies and corporations, called to discuss the various awards which have been made from time to time by the Ministry of Labour, and which related to electricity supply employees, after quoting the resolution passed at the Conference (printed on page 521 of our last issue), states that the resolution has not yet become operative, and that the question has been referred to Sir George Askwith, with the view that he should issue an award on such lines in order that employees at all electrical power stations should be treated in a similar manner. A further meeting of the Conference is to be held.

Appointments Vacant.—Chief assistant electrical engineer, for Birmingham Corporation (£750); junior shift engineer for the Borough of Barnsley Electricity Department. See our advertisement pages to day.

Educational.—BIRMINGHAM.—Owing to the great increase in numbers of students in the Electrical Engineering Department of the Birmingham Technical School, and particularly in connection with the wireless telegraphy classes, the City Council has obtained additional temporary school accommodation at Ludgate Hill.

LEEDS.—The Secretary for Education in Leeds invites applications for the position of teachers of electricity, electrical engineering, and electric wiring work in connection with the Leeds Technical School. Applications to the Principal of the Technical School, Cookridge Street, Leeds.

Woman Electrician Wanted.—A woman electrician is urgently wanted to take charge of the lighting installation in a country house, with dynamo and accumulators. A man operates the steam engine which drives the dynamo. A knowledge of wiring, &c., is required. Wages, 35s. to 37s. a week, with lodgings. We believe this is the first instance in which a female attendant has been inquired for.

Inquiry.—A correspondent seeks information regarding engines running on sewer gas; also apparatus or processes which could be worked in conjunction with a producer gas-engine electricity works generating direct current, such as plant for briquetting anthracite dust, converting clinker into paving slabs, electric welding, &c.

REVIEWS.

Spons' Electrical Pocket Book. By W. H. MOLESWORTH. London: E. & F. N. Spon, Ltd. Price 6s. net.

There are many pocket-books for engineers in existence, but up to the present we do not remember having seen one so useful for electrical engineers as the one now before us. To a large degree the test for such works lies in the numerous occasions for reference that are always cropping up, but before reference can be made, it is necessary for one carefully to peruse the pages of the book under consideration. This procedure would appear necessary for all technical works, but in the case of a "pocket-book," the reader's glance, if any, is usually most casual, so that the actual utility of such a book is then limited through the ignorance of its owner.

In "Spons'" much of the matter will be found to be of more than passing interest, for there are many pithy articles to be found within its pages. A comprehensive index certainly assists one's search, but at the same time individual study is recommended for those who purchase this volume or similar ones.

The book opens with tables of weights and measures, with full details for metric conversion, and other useful tables, too numerous to mention, follow. The Italian graphic symbols are worthy of study and adoption by those who believe in progress, and their inclusion should do much to assist in their international propagation. The careful explanation of terms and fundamental principles will assist the student, while the tables relating to the heating of wires, &c., will meet with the needs of even an expert. Resistances and conductors are fully dealt with and exhaustive data given. Contractors and wiremen are catered for, inasmuch as there is a great deal of information which should be of use to them. Board of Trade and Home Office Regulations are fully given, and later on other standard regulations and rules are reprinted, including those of the I.E.E. The collection of such items under one cover makes the book an extremely handy work of reference. Transmission is handled in a masterly manner, as also is testing. Magnetism and electromagnetism are set forth in an understandable way, so that even a beginner could appreciate the text and diagrams relative to electrical machinery, regarding which many valuable data are set out, the particular section finishing up with the British Standardisation Rules.

Details relative to alternating current next appear, theoretical and practical considerations relating to the principles involved being given, as in the previous sections. Applications of electricity to lifts, machine tools, and electric vehicles are next treated, much of practical use being given concerning accumulators; regarding electric furnaces and electro-chemistry the information appears to be somewhat meagre, but no doubt the next edition of the work will show changes in this respect. The pages devoted to illumination could be improved without much difficulty, since it would appear that matter has been added without due respect to terms previously quoted. The "trade" is also in evidence in this section.

Practically the whole of the remainder of the book is devoted to electric traction, and we are inclined to think that much contained therein might have been cut out with advantage, as the space represents about 30 per cent. of the whole. It is true that electric traction is likely to be of the utmost importance, but there are signs that other branches are developing at an even greater rate, and we should therefore like to see such a book as this rather more general than at present. To those connected with electric railways and tramways "Spons'" will appeal most, but at the same time it is a volume which may be appreciated and utilised by all whose work demands even the slightest knowledge of electricity.

The editor is to be congratulated upon the systematic manner in which it is arranged; the diagrams are very good, and errors are rare.

Hydro-Electric Power. By LAMAR LYNDON. Vol. II. Electrical Equipment and Transmission. London: Hill Publishing Co. Price 15s. net.

In this volume generators, transformers, and switchboards are discussed in considerable detail, and a great deal of information is given on the subject of transmission lines.

The operating speed of a water-wheel is determined within a limited range by the head of water and the power. The periodicity is also limited by the wheel speed, thus at the Keokuk plant 25 periods was chosen for the 10,000-h.p. units because the low head of water gave a very low speed, namely, 57.7 R.P.M.

On the other hand, for a moderate or high head fall a higher periodicity than 25 cycles per second is desirable, because the latter would cause the generators to have a small number of poles, and the rotor to be of small diameter and great length.

Maximum rating of generators is defined as the maximum continuous load which they will deliver with a temperature rise of 50 per cent., no allowance being made for overload capacity. It is stated that up to about 13,000 volts, generators may be directly connected to the line, and that the capacity

of a generator wound for that voltage will be 30 or 40 per cent. lower than if wound for 2,300 volts, because of the extra space taken up by insulation.

In discussing the methods of driving exciters, it is pointed out that if driven by a small auxiliary water-wheel, as the size is small, the wheel is usually inefficient. By driving the exciter with a synchronous motor, the motor may be used to improve power factor. If this is done it is necessary to have, at least one other exciter driven in another way, so as to start up the plant. In some cases storage batteries are installed for use in an emergency, in case of breakdown of one or more exciters.

Transformers.—When a transformer has water cooling coils the amount of water required is dependent on the losses of the transformer, and it is usual to allow $\frac{1}{2}$ gal. per minute per kw. loss. When a transformer is air-cooled it is usual to allow about 150 cu. ft. of air per minute per kw. loss. One kw. will raise the temperature of 1,630 cu. ft. of air at atmospheric pressure 1 deg. C. per minute.

Condenser type terminals of transformers are built up of alternate layers of insulation and of thin metal. The metal layers form equipotential surfaces which distribute the potential between the terminal and the ground in direct proportion to the insulation strength of the material used, provided, of course, that the thicknesses of layers of insulation and the lengths of the layers are correctly proportioned. Each layer of insulation, with its metal layers, acts as a condenser, and thus the completed terminal consists of a number of condensers in series distributing the potential in proportion to their relative capacities.

If single-phase transformers are used, it is possible to connect in circuit two such transformers instead of three; in case one breaks down, the two will carry 58 per cent. of the load (not 67 per cent.) with the same heating as before the breakdown. The two will not parallel successfully with a three-unit bank, because the regulation is worse, and the voltage drop on one of the phases is slightly greater than on the other two.

The delta star connection is widely used for raising generator voltage to line voltage, and it is usual to ground the neutral on the high-tension either directly or by a resistance. Since 1913 the tendency has been towards using outdoor-type transformers, as this practice is more rational than having transformers inside an expensive building.

In warm climates, where the temperature in the sun may reach 135 deg. C., the ability of the transformers to radiate heat is diminished. Therefore, for such situations a shed should be built to shield them from direct rays of the sun.

Switchboards.—The chapter on switchboards is good, and includes the specification of a 5,000-kw., 2,300 to 44,000-volt switchboard, also one for 46,000-k.v.a., 6,600 to 110,000 volts. It is stated that brass and copper pipes are being used in many installations for high-tension bus-bars and connections. Particulars are given of submerged iron-wire rheostats for testing purposes, and it is stated that three tanks, each 6 ft. by 4 ft. by 2 ft. deep, will effectually cool resistance coils absorbing 2,000 kw. at 6,600 volts. A rubber hose-pipe feeding a $\frac{1}{2}$ -in. stream of water into each tank will keep the water sufficiently cool.

Transmission.—On the question of aluminium *versus* copper for transmission lines, the author favours the first-named, the advantages being: (a) Aluminium costs less than copper; (b) for a given resistance or given cost, aluminium is larger in diameter, and this tends to reduce the corona effect on high voltages; (c) the better radiation gives a lower temperature under load, thereby slightly reducing resistance; (d) the larger conductor is more mechanical; (e) the surface of aluminium oxide sheds sleet better than does copper; (f) the lighter weight lowers freight charges and cost of transporting along the line on reels.

Aluminium alone is not adapted for lines in which the spans are great and the cables small, because the metal sags so much at high temperatures. Cables may snake or whip under sudden gusts of wind, which means that all the cables on a pole may not sway together. By losing their normal separation they come too near, and may even make contact. These objections have been largely overcome by providing aluminium cables with steel cores. Formulae are given for bimetallic wires, and it is stated that one made of aluminium and steel costs nearly as much as a copper conductor for the same power.

Dwight's chart for the quick computation of transmission lines is included.

Poles.—The author prefers wood or concrete poles to steel poles for transmission lines, and, as the latter are conventional practice with many engineers, there is a complete discussion of the subject. Comparative estimates of tower lines and pole lines are given, and there are some very full specifications.

A valuable chapter of transmission calculations contains data on corona effect, surge voltages, transposition of wires, &c.—E. K. S.

Principles and Practice of Electrical Engineering. By ALEX. GRAY, Whit-Sch., M.Sc. Second Edition. London: Hill Publishing Co., Ltd. Price 12s. 6d. net.

When we reviewed the first edition of this work a few years ago we described it as bearing "the hall-mark of sound

experience, and accurate, complete knowledge of the science . . . one of the best books on electrical engineering that any kind of engineering student could wish to study from." Naturally, the new edition is no less worthy of our encomiums. It has not been greatly changed, the additions consisting mainly of a considerable number of problems relating to the contents of the respective chapters; these are all collected at the end of the book, and appear to be admirably adapted to make the student think, and to impress the leading facts upon his memory. The desirability of adding such a collection of examples was pointed out in our previous review. The treatment of armature windings has been recast, to show more clearly the transition from the Gramme to the drum type of winding; minor changes have also been made in the chapters on alternating current circuits, and in the treatment of the force acting on a conductor carrying current in a magnetic field. As a whole, however, the book is practically identical with the earlier edition, and the author is to be congratulated upon the thoroughness with which his work was accomplished in the first instance, which has left so few loopholes for improvement. We cordially recommend the work to engineering students; it is one of the few selected volumes which we always keep within arm's reach.

Laws of Physical Science. By EDWIN F. NORTHRUP, Ph.D. London: J. B. Lippincott & Co. Price 8s. 6d. net.

This is a book of much originality, being nothing less than an attempt to put under one cover a full list of the general propositions or laws of science. Every student of the sciences is, of course, familiar with the data pertaining to those sciences—they are to be found in many manuals—but this work goes much beyond that sort of thing. It gives the laws underlying the data. The author hopes that students "will not only find guidance, but will also derive inspiration by having before them under a single view the very epitome of the world's heritage of the fundamentals of its knowledge and wisdom."

Although the title of the book refers to the *laws* of physical science, the author has found it a difficult matter to say just what *are* laws. So, in order that nothing possessing any claim to the dignity of a law should be omitted, many general propositions, theorems, and mere statements of important facts have been included.

The general statements have been classified in six sections:—I, mechanics; II, hydrostatics, hydrodynamics, and capillarity; III, sound; IV, heat and physical chemistry; V, electricity and magnetism; VI, light.

The system of stating the laws, propositions, and theorems is as follows:—There are some 189 pages in the book, and on an average about three statements are given per page. Each law is plainly marked by a title in large type. Then there follows a brief explanation in words and, if necessary, in mathematical symbols. The account finishes with references to easily accessible text-books, and in some cases to original articles or papers. The method is best understood by considering an example. Taking Section I, Mechanics, and turning to page 19, we find:—

YOUNG'S MODULUS.

By "Young's Modulus" is understood the force which would be required to stretch a body of unit cross-section to double its length if such lay within the elastic limit. It is a constant for any one material.

$$\text{Thus, Young's Modulus} = M = \frac{L F}{e a}$$

where L = length of body (usually a wire),

a = area of cross-section,

F = stretching force applied,

e = total elongation produced by F .

Similar moduli hold for compression, flexure, and torsion. (Crew, *General Physics*, p.131. Also *Ganot's Physics*, art. 87. Also Thomson & Tait, *Treatise on Natural Philosophy*, Part II, arts. 686-688.)

At the end of the book there is an alphabetically-arranged bibliography of all books and journals referred to, and a very full index with duplicated references, so as to aid in the quick location of subject matter.

There can be little doubt that the idea underlying the work is a good one. Advanced students of the sciences, especially those engaged in research work—and we are likely to hear quite a lot of this kind of work in the near future—will find it useful to be able to look up any fundamental law or conception in any branch allied to their own, without the necessity of hunting through a library. And, moreover, such a work as this is welcome nowadays when none of the sciences can any longer be locked fast into a separate compartment, for one shades off into another, and no man can define the border line.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—The Morecambe Corporation has increased the salary of its electrical engineer by £30.

The Walthamstow F.D.C. has granted the following increases of salaries to officials in the electricity department:—Mr. G. J. Hollyer, £35 per annum; Mr. T. F. Lynn, £25 per annum, without bonuses; Mr. G. W. Stubbings, £10 per annum, with bonuses; Mr. W. H. Arnold, £10 per annum.

Mr. W. J. Cox has been appointed works manager at the Derby electricity works, at a salary of £240 per annum, in place of Mr. W. C. Dinn, resigned.

Mr. F. R. HOBLEY, mains engineer to the Lowestoft Corporation electricity department for the last 10½ years, has been appointed electrical engineer to the New Van Mining Co., of Llanidloes, South Wales, and has already taken up his new duties. On leaving Lowestoft he was presented with a memento, the presentation being made by the chief engineer on behalf of the whole of the staff and employees.

General.—SIR JOHN TURNEY has retired from the chairmanship of the Nottingham Corporation Electricity Committee after occupying that position for over 25 years. He is succeeded by Mr. R. H. Swain. At the last meeting of the Committee, Mr. H. Talbot, the city electrical engineer, was presented with a silver rose bowl, the gift of Sir John Turney. Mr. Talbot has been associated with the undertaking for 25 years. Sir John has also presented a silver rose bowl to Mr. A. Brown, the city engineer, on the completion of 50 years' service.

Mr. H. R. PYKE has resigned his position with the India-Rubber, Gutta-Percha & Telegraph Works Co., Ltd., and joined the staff of Messrs. S. G. Leach & Co., Ltd., as manager of their motor department.

The Birmingham City Council on Tuesday appointed Mr. W. BREW, M.Inst.E.E., head of the electrical engineering department of the Municipal Technical School at £400 per annum, in place of Mr. E. O. Turner, B.Sc., resigned.

Prof. F. W. BURSTALL, Professor of Mechanical Engineering at the University of Birmingham, has been appointed gas examiner, in the place of the late Mr. Crésswell, at an annual salary of £200.

Ald. SMITH has been re-elected chairman, and Col. WADHAM (at present with the Forces) vice-chairman, of the Burrow Corporation Electricity Committee.

We desire to congratulate Mr. GEORGE SUTTON upon his election to the chairmanship of the important concern with which he has for the past 36 years been so prominently associated—W. T. Henley's Telegraph Works Co., Ltd. Mr. Sydney Gedge has been a director of the company for 37 years, and for 30 of these he has acted as chairman. His genial presence at the company's meetings has always engendered great good humour, and his speech has generally formed a suitable introduction to the very practical informing remarks with which Mr. Sutton, as managing director, has acquainted the shareholders with the actual situation of the electrical industry so far as it was represented by Henley's. Mr. Gedge, owing to advanced age, has decided to relinquish his position as chairman as from January 1st, 1918, but the company will still have the benefit of his long experience on the board. Mr. Sutton will henceforth hold the position of chairman and managing director. For Henley's, as for all important electrical industrial undertakings, the coming years will bring innumerable problems, but those who remember how well the concern was piloted through the troubled period of several decades ago, and who have followed its uniform progress for a good many years past, will feel assured that with the experienced leader of the past 36 years at the helm the concern will know well how to avail itself of the very great opportunities that will present themselves for the display of progressive and successful enterprise.

Roll of Honour.—The death in action is reported of Corporal H. C. HAMMOND, of the Tank Corps. He was formerly in the service of the Lytham Tramways Co.

Private TOM SCOTT, who was formerly employed at the Leeds electric power station, has died of wounds received in action.

Second-Lieutenant ERNEST S. LEAROYD, Middlesex Regiment, who has been killed in action, aged 28 years, was with Messrs. A. Learoyd & Son, metal merchants, Clapton.

WILLIAM EDWARDS, an employé of the Barrow Corporation electricity department, has fallen in action.

Corporal G. BRADLE, formerly of the Scarborough Tramway Co.'s staff, who has been wounded, has been awarded the Military Medal.

Gunner J. O. DONOVAN, R.H.A., formerly in the staff of the Brompton & Kensington electricity station, has been killed in action.

Second-Lieutenant VINCENT H. M. M'MAHON, Mechanical Transport, A.S.C., who appears in the list of officers mentioned by Lieutenant-General Milne, Commander-in-Chief of

Patent Extension Application.—Sir James Dewar, F.R.S., LL.D., is applying for an extension of term for Patent No. 13,638/1904 for his invention "An improved method of absorbing gases and the application thereof to the production of high vacua and the separation of gases."

the British Salonica Forces, for gallant conduct and distinguished services, is the son of Mr. J. J. McMahon, electrical engineer, Manchester Corporation tramways. Previous to the war he was engaged in the rolling-stock department of that undertaking.

Private R. GEE, South Lancashire Regiment, formerly missing, and now reported killed, was prior to enlistment employed by Messrs. Charles Macintosh & Co., electric wire and cable manufacturers, Manchester.

Lance-Corporal J. B. HAMILTON, H.L.I., who has received the V.C. for most conspicuous bravery and devotion to duty, was employed in the electrical department of the Steel Co. of Scotland, Ltd., at Hallside, Cambuslang, for many years, and prior to joining the H.L.I. he was employed for six months with the Electrical Co., in Pitt Street, Glasgow.

Sergeant A. APPLETON, King's Own Yorkshire L.I., reported wounded and missing a year ago, is now officially reported killed. He was employed by Messrs. Vlasto, Clark and Watson, electrical engineers, Warrington.

Gunner J. SHAW, R.G.A., killed in action, was in the employ of the Tudor Accumulator Co., Dukinfield.

Motorman A. A. ALLEN, of the West Ham tramways, who was promoted in June, 1917, to the rank of Second-Lieutenant in the 13th Royal Fusiliers, has been granted the Military Cross for conspicuous service on October 4th, when, after all other officers of his company were put out of action, he took charge and held the position for 18 hours.

Sergeant T. BARCLAY, who was employed on the Glasgow Corporation tramways, has been awarded the Military Medal.

NEW COMPANIES REGISTERED.

Armorduct British Co., Ltd. (148,980).—Registered November 26th. Capital, £50,000 in 41 shares. To acquire by licence of the Board of Trade the undertaking of the Armorduct Manufacturing Co., Ltd., the books and documents of which are liable to inspection under Section 2 (2) of the Trading with the Enemy Act, and to carry on the business of electrical engineers, electricians, manufacturers of and dealers in internal-combustion engines, conduits, tubes, wires, cables, pottery, rubber, gutta-percha, and metals, &c. Purchase of considerations, £15,500 in cash, of which £50 is allocated to goodwill. The subscribers (each with one share) are:—H. A. Marsh, Ash Cottage, Gravelly Hill, managing director; G. C. Busgell, 76, Handsworth Wood Road, Handsworth, Birmingham, managing director; W. H. Glassey, "Overley," Station Road, Yardley, managing director; A. D. Tipper, Hamstead Hill, Handsworth, ironfounder; G. A. T. Legg, Penybryn, Sedgley, near Dudley, managing director; G. H. Fraser, 757, Royal Liver Building, Liverpool, export merchant; J. D. Burnside, 15, Lawley Street, Birmingham, secretary. Minimum cash subscription: 100 shares. The articles contain the usual provisions for excluding enemy holdings or for high control. The first directors are:—H. A. Marsh, W. H. Glassey, A. D. Tipper, G. A. T. Legg, and G. H. Fraser. Registered office: Bathurst Works, Witton, Birmingham.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Cutting Bros., Ltd.—Memorandum of satisfaction to the extent of £2,900 on September 27th, 1917, of debentures created June 20th, 1916, securing £3,450, has been filed.

Gambrell Bros., Ltd.—Land Registry Charge on leasehold laboratories and works in Southfields, S.W., dated October 30th, 1917, to secure all moneys due, or to become due, from company to National Provincial Bank of England, Putney.

James Keith & Blackman Co., Ltd.—Memorandum of satisfaction in full on November 11th, 1917, of debentures dated December 5th, 1902, securing £2,400, has been filed.

CITY NOTES.

Amazon Telegraph Co., Ltd.—Mr. C. W. PARISH presided, on November 27th, at the annual meeting, held in London. He said that, compared with the previous year, the improvement shown in the report was quite satisfactory. The rubber crop of the Amazonas district had increased slightly. During the year the highest and lowest quotations for fine hard Para rubber were 3s. 7d. and 2s. 8½d. per lb., respectively, and for the greater part of the time the price was over 3s., whereas during the previous year it fluctuated between 4s. 1d. and 2s. 1½d. The traffic receipts of the company showed an increase of £8,940, or over 19 per cent. The gross revenue showed an increase of £10,557, or over 17 per cent. The total working expenses increased by only £711, or less than 2½ per cent, which was not large considering the general rise in prices which had taken place all over the world. The result was that the net revenue showed an increase of £9,846. They had been able to add 1 per cent. to the dividend, and to carry forward about £100 more. The investments now

amounted to £51,313, an increase of £38,839. They invested a total of £50,000 in British Government securities. In the current year, the traffic receipts up to the present were nearly £3,000 higher than those for the same period last year. The prospects for this season's rubber crop were believed to be good. If their expectations materialised he thought they might confidently look forward to having at least as good a year as the one they had just passed through. A portion of the company's revenue was derived from a service of local deferred messages, which was instituted in July, 1914. These messages were subject to a delay of not less than 10 nor more than 21 hours, and up to September last year were carried at half-rate. The directors, however, were not very satisfied with the result of the experiment, as although this class of traffic at first showed signs of expanding, it ultimately fell away considerably. They decided, therefore, to make a further reduction in the rate, which came into force in October last year, and as a result there was a very satisfactory increase in the number of local deferred words transmitted, the receipts having increased by nearly £3,000 as compared with the previous year, and they hoped to see a further expansion during the current year.

Allgemeine Elektrizitäts-Gesellschaft.

The report of the directors for the year ended June 30th, 1917, states that the whole of the company's activity was devoted, as in the preceding year, to the problems raised by the war, the multiplicity and extent of which would be reserved for mention in the future period of peace. At present the company would have to limit itself to the statement that the orders received and the deliveries effected were considerably greater than in 1915-16. The superficial area covered by the workshops in full operation had risen from 203,874 square metres to 808,881 square metres, and the number of employés at the end of the financial year had advanced to 79,293.

The machine sets in construction in the turbine factory comprised those of powers rising to 50,000 kw., whilst the machinery works had carried out the largest types of transformers hitherto made, namely, of 60,000 kw. and 110,000 volts, and was continuously occupied with the production of high-tension material. In wireless telegraphy important innovations were developed, and the deliveries of the apparatus factory exceeded the figures for the previous year. It was possible for the glow-lamp branch to bring sale prices into better proportion to the costs of production. The aeroplane department, for which workshops had been erected at Hennigsdorf, and at Johannisthal on the Upper Spree, was carrying out work which afforded satisfactory prospects also for peace times.

The demand for electrical machinery and apparatus for war industries, particularly the chemical industry, was exceptionally active. Remunerative orders were also received from the coal mines, whilst the iron and steel works continued to require electrical equipment, especially large rolling train drives. The central-station department completed the Gerstein works in Westphalia with a capacity of 30,000 kw., and the power station at Zschornowitz, in the lignite district of Bitterfeld, for the Electro Works Co., and the power station at the Fortuna mine was enlarged by 8,000 kw. The Ferro-Silicon Works of Elverlingen placed an order for a complete sinking plant with a transformer output of 14,000 kw., and the Bavarian Nitrogen Works Co. and the Silesian Electricity and Gas Co. gave contracts for turbo-dynamos of large dimensions. In the case of the railway department, the activity was almost exclusively applied to the production of replacement plant for existing lines, and the work on the A.E.G. high-speed railway in Berlin was temporarily restricted. The accounts show the following figures for the past four years, 20 marks being assumed as the equivalent of £1 sterling:—

	1913-14.	1914-15.	1915-16.	1916-17.
Share capital	£7,750,000	£7,750,000	£9,200,000	£9,200,000
Gross profits	1,132,000	1,544,000	1,987,000	2,339,000
General expenses	73,000	73,000	91,000	103,000
Taxes	106,000	145,000	143,000	195,000
War allowances	—	230,000	377,000	507,000
Depreciation	44,000	44,000	45,000	55,000
Net profits	908,000	1,028,000	1,324,000	1,478,000
Net profits, including balance forward	944,000	1,064,000	1,359,000	1,518,000
Directors' fees	23,000	27,000	28,000	34,000
Bonuses to staff	60,000	75,000	100,000	100,000
Pension fund	50,000	75,000	100,000	100,000
War benevolence	—	—	75,000	75,000
Dividend	775,000	852,000	1,017,000	1,150,000
Dividend, per cent.	10	11	12	12½
Carried forward	26,000	35,000	39,000	59,000

The share capital now stands at £10,000,000, the difference between this amount and £9,200,000 given in the table only ranking for dividend from July 1st, 1917. In addition, the loan debt reaches £5,271,000, and the mortgage debt £135,000. The credit at the company's bankers is stated to be £5,575,000, as compared with £6,680,000 in 1915-16, and £4,531,000 in 1914-15, whilst the advances made to the Berlin Electricity Works Co., the A.E.G. High-speed Railway Co., and other undertakings raise the total outstanding credits to £10,710,000, as against £10,010,000 in the preceding year. It is further mentioned that all new machinery, plant, patterns, &c., have been entirely written off, as in previous years. In conclusion, the report gives particulars of the company's investments, and refers to the transfer to the State of the interests held in the Electro Works Co.

French Companies.

The *Société l'Eclairage Electrique* reports net profits of £194,000 for the year ended on June 30th, 1917, as against £146,000 in the previous year. It is proposed to distribute 12s. per share, as in 1915-16.

The *Compagnie Parisienne de l'Air Comprimé* reports net profits of £37,000 for 1916-17, as contrasted with £63,000 in the previous 12 months. As the compressed-air business resulted in a deficit, no profits would have been realised had it not been for the return received from the settlement of accounts with the Union des Secteurs and from investments. The dividend in 1915-16 was at the rate of £1 4s. per share, and it is assumed that the rate for the past year will be 14s. 5d. per share.

The directors of the *Société Industrielle des Téléphones* report gross profits amounting to £373,000 for the year ended on June 30th, 1917, as compared with £260,000 in the preceding year. After deducting general expenses, interest on loans, and setting aside £100,000 for depreciation, as against £60,000 in 1915-16, the balance permits of the payment of a dividend of £1 12s. per share, as contrasted with £1 4s. and 12s. per share in the two previous years respectively. The sum of £64,000 has been placed to the contingency fund, and £30,000 to the legal reserve fund.

The report of the *Société d'Electro-Metallurgie de Dives* for 1916-17 states that new workshops were erected for Army purposes, and, apart from these installations, the greatest work undertaken related to the diversion of the sources of the Val au Loup and of the Caudemuche. As net profits the accounts show the sum of £223,000, as compared with £231,000 in the preceding year, and a dividend of £2 8s. per share has been declared for 1916-17. The reserve fund has received an addition of £104,000, thus raising it to £210,000.

The *Société Anonyme Electro-Metallurgique (Procédés Paul Girod)* reports that the works were actively engaged in 1916 not only in the distribution of energy for the Acieries Paul Girod as well as in the district of Lyons served by the Société Hydro-Electrique de Lyon, but also in the production of special alloys. After providing for depreciation, the accounts show net profits amounting to £281,000, as compared with £59,000 in 1915. The tax on war profits absorbs £172,000, and the balance permits of the payment of a dividend of £2 per share. At the recent meeting a proposal was confirmed for amalgamating the company with its subsidiary—the *Compagnie des Forges et Acieries Electriques Paul Girod*. The transaction is to take place this year, after the latter's capital has been increased for the purpose of effecting an interchange of shares.

Fraser & Chalmers, Ltd.—For the year ended June 30th last the profit, after providing for all expenses and depreciation, and after making provision for special taxation, was £36,174, as compared with £21,669 in the previous year. The works have been fully employed, and an increased output has been obtained. The results show improvement, notwithstanding the heavy increases in the cost of material and labour, and the difficulty of obtaining sufficient supplies. The merchandise business in South Africa has also been on a larger scale, in spite of freighting difficulties, and the results of the trading there and at the other branches of the company have been satisfactory. The directors recommend a dividend of 5 per cent., less tax, on the ordinary shares, and after transferring £20,000 to the reserve account (increasing it to £100,000) to carry forward the balance of £16,773.—*Financial Times*.

Tata Hydro-Electric Power Supply Co., Ltd.—The great success with which the introduction of electric power from the generating station on the Ghats is being developed in Bombay is revealed by the report of this company for the half-year ending June 30th. The company paid dividends of 7 per cent. per annum, both preference and ordinary shares, for the second half of last year. For the half-year just ended the directors recommend a further 7 per cent. per annum for preference shareholders, and a further 8 per cent. per annum on ordinary shares. The current now being supplied to motors in Bombay amounts to 48,000 h.p. The whole undertaking has been working most satisfactorily. Thirty-six mills are receiving power, and only the difficulties arising from the war prevent development being more rapid. Good progress has been made with the preparation of the new lake at Shirawata above the Ghats for the supply of additional water to the generators, and two-thirds of the new dam there has been completed.—*Indian Engineering*.

Companies Struck Off the Register.—The following companies have been struck off the Register, and are accordingly dissolved:—

Advisory Engineers' Corporation.	Midland Magneto Co.
All-British Electrical Co.	Fletcher's Electric Fittings.
Alphons Custodis Chimney Construction Co.	Krupka & Jacoby, Ltd.
Anti-German League.	Magneta Time Co.

Brazilian Traction, Light & Power Co.—Quarterly dividend of 1½ per cent. on the fully-paid cumulative preference shares.

Western Telegraph Co., Ltd.—First quarterly dividend, 3s. per share, free of tax, for the year ending June, 1918, being at the rate of 6 per cent. per annum.

United Wire Works, Ltd.—For the year ended September 30th, after providing for depreciation, bad debts, and excess profits duty, the credit balance is £14,036. Dividend, 7½ per cent. on ordinary shares, free of income-tax, £1,500 to general reserve, leaving £3,536 to carry forward.

Adelaide Electric Supply Co., Ltd.—A final dividend on the ordinary shares of 7 per cent., tax free, is announced, making 12 per cent., tax free, for the year.

Melbourne Electric Supply Co., Ltd.—Final dividend on the consolidated ordinary stock of 5 per cent., tax free, making 10 per cent., tax free.

Pollock & Macnab, Ltd.—A petition for confirming the reduction of capital from £60,000 to £50,000 has been presented.

Globe Telegraph & Trust Co., Ltd.—Quarterly dividend, 2s. per share on the ordinary shares, free of tax.

Provincial Tramways Co., Ltd.—With the final dividend and bonus now announced, the total distribution on the ordinary shares for the year is 10 per cent.

Cape Electric Tramways, Ltd.—Dividend, 5 per cent., less tax.

*** STOCKS AND SHARES.**

TUESDAY EVENING.

HAD these been ordinary times, the quietude such as the Stock Exchange markets are experiencing would have been attributed to the advent of Christmas, but as this is scarcely a reason which can be advanced in war-time, members of the House put down the somewhat lifeless condition of markets to the Russian developments, to the War Bonds campaign, and to the news of a slight set-back on the Western Front. Prices keep steady in most departments, and, having regard to the paucity of business, to say nothing of the claims of the Government borrowings, it is a little surprising that the general strength should be so well held. There is less gambling going on, which is a good thing, but it has the effect of causing markets to appear dry and inanimate.

The home railway position has not been improved by the settlement of the latest strike. Prices gave way on the trouble which appeared imminent, and they have not recovered from the loss which they then sustained, notwithstanding the compromise arrived at between employers and employed. It is assumed that the greater part of the increased wages bills will have to be footed by the Government, i.e., the country, and that the companies themselves will bear but a small proportion of the extra burden laid upon the industry by the latest all-round rise in wages. People, however, look ahead, and are disposed to wonder what will be the position at the end of the war, when the companies will presumably re-assume control of their own affairs, and when there will be no Government subsidy to help meet the increased costs of working. It is held accordingly that every rise in costs stores up future difficulty for the railway companies, and adds to the reasons why investors should seek fields other than home railway stocks for the employment of their money. Undergrounds are concerned indirectly by the broad considerations which govern British railway working, and the stocks are heavy with the rest.

The most active feature of the markets with which we deal is furnished by another jump in American Marconis. The price has strengthened 26s. 3d., and has been steadily rising from a level nearly 10s. lower down. As we have already indicated, the buying comes principally from the North of England, where rumour credits inside information with news of an important contract just concluded by the American Marconi Co., and optimists look for the price to go well over 30s. It may be well to lay accent on the word optimists. The parent shares are practically unchanged, though the strength of Americans reflects a little brightness to Canadians, these hardening to 11s. 9d. Marines are also a good spot at 52s.; and this section of the industrial market is one of the few strong spots.

Anglo-American Telegraph Preferred weakened a trifle, but the cable list as a whole is strong, and the monotonous complaint is reiterated that it is easier to sell than it is to buy. Some people are talking of the possibility of another increase in the dividends of the Western and Eastern groups, with its corollary of a rise in the Globe dividend. Speaking without intimate knowledge, this seems to be looking rather far ahead, because, with the possibility which has to be faced of further taxation, it can hardly be expected that such conservative boards as these which control the affairs of the cable companies would increase dividends, save in very exceptional circumstances, and, moreover, rates have already been advanced once since the outbreak of the war.

Western Telegraphs are ½ better, and so are China shares. The usual quarterly dividends on Globe ordinary and preference are just declared. Great Northerns are flat, a drop of 50s. occurring on a little pressure to sell. Cuba Submarines are good, with a 5s. rise. Oriental Telephones have reacted. Automatic Telephone ordinary are better at 21s. 3d.

City of London Electric ordinary rose ½ to 13½, and the remainder of the list keeps very hard. Manufacturing issues are somewhat irregular. General Electric ordinary are 20s. up at 20½. India-Rubbers gained ½ at 14½. Electric Construc-

tions have recovered their dividend deduction. Brush ordinary improved to 28½. British Aluminium show a small rise at 32s. 6d. On the other hand, Westinghouse preference have receded to 56s. 3d.; Balcocks are the turn easier at 61s. 6d. Edison Swan keep steady at 26s.

The Adelaide Electric Supply Co. declares a final dividend of 7 per cent., making 12 per cent., free of tax, for the sixth successive year, and the Melbourne Co. is to pay 5 per cent., making 10 per cent. (also tax-free) for five years running. In spite of these excellent results, Melbourne ordinary has fallen 3 points to 170. Adelaide ordinary are not quoted on this side. The 6 per cent. preference stand at 4½. Anglo-Argentine First preference weakened to 2 15/16 on the incessant labour alarms in the Republic. Mexican issues are flat. The Second Mortgage bonds of the Light & Power Co. have dropped to 26½. Rio Seconds are easier at 76. Georgias fell ½ to 13. British Columbia 4½ per cent. debenture at 58 is 2½ up, though the preference is 2 points lower at 42½.

The rubber market remains lifeless, and the fall in the price of the material to a little below half-a-crown per lb. led to a fresh bout of profit-taking. Rubber is out of favour for the time being. There is no speculation going on, and the buyers of the earlier part of the year are now devoting their financial energies to shares which offer more scope for immediate profit. The base-metal markets are better, more especially that for tin shares, where a further record attained by the metal itself has had the effect of bringing in buyers for West Africans, although the home products of Cornwall are still neglected. The armament group has given way, and there is not so much going on in iron and steel shares generally, the decline in activity spelling, as usual, a slight reaction in quotations.

SHARE LIST OF ELECTRICAL COMPANIES.

Electric Traction in Coal Mines.—In the United States to-day storage battery locomotives are being used in mines both for gathering service and for main haulage. As one of these "electrics" will do the work of three to eight mules, it displaces a large number of drivers, who can be more profitably employed at the coal face. The cost of hauling coal and ore with storage-battery locomotives is only about one-half what it costs to haul with mules or horses, and the mine output can be materially increased and the sanitary conditions improved by the use of the electric vehicle. The Electric Vehicle Section of the National Electric Light Association has collected some interesting data showing the actual savings of the miniature electric locomotives over mule haulage in mines. The Madison Coal Corporation, one of the largest coal-mining corporations of the middle West, which strongly advocates the use of the electric locomotive in coal mines, based on actual operating experience, states that in addition to the money saving in ton haulage there is a remarkable financial economy in the prevention of injuries, for while mule drivers form only 5 per cent. of the entire working forces, their accidents amount to 26 per cent. of the whole number, and the cost in connection with them amounts to 34 per cent. of the total liability cost. It is found that the total monthly cost of maintaining four mules with drivers is \$342.80; the tonnage gathered is 8,368 tons, and the cost, altogether with mules and drivers, per ton, is \$0.04096. The cost of maintaining a storage-battery locomotive one month is \$175.70; the tonnage gathered is 8,900 tons, and the total cost including \$0.00125 for energy per ton is \$0.02099, showing a difference in favour of the locomotive of \$0.01997 per ton.

The Pocahontas Smokeless Coal Co., of West Virginia, is also successfully operating storage-battery locomotives. At this mine four cars each weighing 1,300 lb. empty, and 4,100 lb. loaded are hauled on each trip by one electric locomotive, on main entry, a distance of about 2,500 ft., including 1,200 ft. against 3 per cent. grade, 400 ft. against 2½ per cent. grade, and short grades of 5 and 7 per cent., all against the loads. To get out the 400 tons a day that this mine should produce, the mule haulage would cost \$735 a month and battery haulage \$306 a month, making the very substantial saving of \$129 a month in favour of the "electrics." Furthermore, the maximum number of mules and cars allowed by the track conditions could not handle 400 tons a day. The upkeep on ties and track was quite considerable with the mule haulage, and is greatly reduced with the locomotives. It is estimated that in one year the "electrics" will save the cost of the whole installation, and at the same time increase the coal output by two-thirds.

DIESEL ENGINES AND THE WAR.

By "PULVERISER."

THOSE central-station engineers who have Diesel engines under their control are, at the present time, working under serious disabilities. Not only have they difficulty in obtaining the specially trained staff required, and in replacing defective and worn parts, but a serious situation has arisen with regard to fuel supply. There is undoubtedly a feeling that their efforts to do the best, or the seeming best, in the country's interest, are thwarted by authority.

Diesel engines were worked in this country until 1915 almost entirely on imported petroleum residue fuel oil. About two years ago it was considered to be desirable that a home-produced substitute should be found in order to reduce purchases abroad.

Experiments were commenced in order to test the practicability of using tar oils, which are by-products of gas manufacture. The Diesel Engine Users' Association encouraged these efforts, and inquired as to sources of supply. Several papers were read by experimenters and others who could assist.

About 12 months ago matters had progressed so far that certain suitable grades of tar oil were obtainable at reasonable prices. They could, however, only be used in engines having rather costly pilot ignition. Other engines could only use tar oils when running near full load. Invention was further stimulated, and six months ago comparatively simple alterations to pulverisers were developed, so that any Diesel engine could be commercially used on tar oil when running at from half to full load. The technical problem was solved, the supply of fuel was forthcoming, and alterations proceeded apace.

It appears, however, that the proposed increased use of tar oil attracted the attention of a Controller, and restrictions were imposed. Engine users could, however, in most cases show that the work was "war work," and there was no serious difficulty in obtaining licences. Lately, however, an alarming position has developed. The Controller recently allocated a fixed and inadequate annual allowance of tar oil for engine users, but *there is no restriction on the use of petroleum fuel*. In effect, Diesel engine users are told: "Use as much petroleum as you like; use shipping to bring it over, pay your money abroad, but do not use tar oil."

This has been followed up by a somewhat tantalising price control, fixing tar oil at about £4 10s. per ton, while petroleum has rushed up to £16 per ton. It would appear that only a very pressing national need for tar oil, for more important purposes than the supply of power for munitions factories, could justify this state of affairs, which is obviously very much in favour of the importer and against the home producer and user. If allowed to continue, it must result in heavy increases in charges for power to consumers.

This has evidently been dimly realised by the Controller, as a circular has been addressed to central-station engineers asking for a return of tar oil used in the first half of 1917, an estimate for the same period of 1918, and for details of stand-by steam plant. It is a characteristic feature of this circular that no figures are desired for petroleum fuel oil. The proposal underlying this last request is that Diesel engine users will be compelled by high prices of petroleum fuel and by the restriction on tar oil to shut down their Diesels and run their antiquated steam sets, so that the Controller will be able to point to reduced consumption of his particular commodity, which is apparently the one aim and object of a Controller. From the point of view, however, of national interest, the Diesel engine user is unable to understand the position. Tar oil can usually be obtained locally, or with a short railway journey. Fuel oil of all kinds has a producing value of from four to five times that of an equal weight of coal. The man power required for loading and unloading is much less than with coal. Diesel engines have for these reasons shown increasingly favourable results as the distance from sources of coal supply increases. In the South of England, where Diesels are plentiful, coal must come along the munition-congested routes and in the same direction, *i.e.*, North or West to South, causing further congestion. The Coal Controller and the railway

authorities are unable to deal satisfactorily with the present traffic, yet Diesel users are asked to replace 1 ton of fuel oil by 5 tons of coal, and 10 to 20-mile journeys by 50 to 100-mile trips. It would be necessary to engage more stokers, coal trimmers, carters (for coal and ashes), use more water, and, in many cases, raise prices of electricity if the use of old steam plant in place of Diesel engines were brought about.

At present the general opinion is that the effect of the policy being carried out is directly contrary to the ideals we have been asked to keep in mind—reduction of overseas traffic, of transport and of labour, and economy in use of coal—and that the restriction on the use of tar oil is a direct encouragement to profiteering in petroleum.

It is felt that a short-sighted Controller has got to work on his own watertight compartment without consulting his *conféres* who control shipping, railways, coal, and man power. If these latter officials have been consulted, and if they state that, notwithstanding the obviously bad effects from the point of view of their departments, it is desirable to persist in encouraging the use of any and every form of fuel in preference to tar oil, there will be a cessation of opposition from Diesel engine users, and they will, no doubt, assist in every way in making the change.

GAS FIRING BOILERS.

By T. M. HUNTER, M.A., B.Sc.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS.)

(Continued from page 510.)

Drying and Cleaning Gas.—It is very important that the gas should be dry when burned. At any temperature from 0 deg. to 100 deg. C. gas will take up a known amount of water as vapour, and this amount can be found in an air-saturation table. If the gas has been cooled or washed in water, it is reasonable to assume that it is saturated with water to the amount corresponding to the lowest temperature to which the gas has been brought. As an example of the amount of water carried in this way, the author had recently to use, at 15 deg. C. and 55 deg. C. respectively, the two producer gases described in the foregoing table. The former gas carried under 2 per cent. by volume of water vapour, and the latter carried 15½ per cent. This vapour must all be heated when the gas is burned, and it not only lowers the flame temperature, but also is responsible for carrying to the chimney a large quantity of sensible heat.

To show the actual loss from this cause, let us assume that we have cleaned blast-furnace gas from the same furnace, in one instance at atmospheric temperature with 12 to 15 grammes per cu. metre of water vapour, and in the other instance gas saturated at 70 deg. C., carrying about 362 grammes per cu. metre. In both cases the gas is to be burnt under boilers with an excess of air of 25 per cent.

In the first case the combustion temperature of this gas when burnt with an excess of air of 25 per cent. is 1,294 deg. C., found by using the Le Chatelier formula.

Now take the gas at 70 deg. C. The combustion temperature is found to be 1,010 deg. C.

There is a drop of 284 deg. C. in the combustion temperature, which, of course, is a very serious matter. It is much more difficult to obtain complete combustion of this mixture of aqueous vapour and gas with an excess of air of 25 per cent. than if gas alone is dealt with. It is also a well-known fact that the efficiency of a boiler depends in the first instance on the initial temperature of combustion, and if the latter is lower the efficiency of the boiler is certain to decrease. The evaporation per sq. ft. of heating surface is certain to be considerably smaller if wet gas is used than with dry gas.

We have next to consider the effect of the water vapour on the efficiency of the boiler. The loss through waste heat for dry gas would be 21 per cent. of the total value of the gas, and for wet gas 29.8 per cent. In other words, the presence of the water in the gas will cause an unavoidable and irredeemable loss of 8.8 per cent., in addition to the loss by the reduced flame temperature. Assuming in both cases 5 per cent. loss through radiation and conduction, the actual efficiency for dry gas would be 71 per cent., and for the wet gas 65.2 per cent., which is equivalent to a drop in the output obtainable from the same quantity of gas amounting to 12 per cent.

So far as regards the efficiency, but it will also be worth while to consider the evaporation obtainable in both cases, assuming that the boiler is working on its maximum load, that is to say that the boiler flues pass the maximum quantities of gas and air which the chimney draught can convey

at the most favourable position of the damper. In the case of a 30 ft. \times 8 ft. Lancashire boiler, with a dry gas under the above described circumstances the highest possible evaporation is 6,000 lb. of water from and at 212 deg. F. At 70 deg. C. each cubic foot of gas carries 0.0228 lb. of water, and at maximum load the evaporation works out at 4,725 lb. from and at 212 deg. F.

The simple presence of water in the gas can, under otherwise absolutely equal conditions, result in:—

1. A drop of efficiency of nearly 9 per cent.
2. A drop in evaporation of more than 21 per cent.
3. The loss due to lower flame temperature, which the author has not attempted to calculate.

It is evident that an engineer who has to specify a producer plant, or a gas-cleaning plant, where washing of the gas is part of the process, should take care to specify the maximum amount of water vapour allowable in the gas supplied.

Contrary to a frequently expressed opinion, the author does not believe that the dust in itself impairs seriously the heating value of blast-furnace gas; and the uncleaned gas has the advantage that it contains the sensible heat. The dust, however, may seriously affect the efficiency of the boiler. If two Lancashire boilers are run side by side, the one on cleaned and the other on uncleaned blast-furnace gas, it will be found that at first the results as regards both evaporation and efficiency are about the same. Soon dust will start to accumulate in the boiler flues, and as this dust is an insulating agent it will impair both the evaporation and the efficiency. After four or six weeks the dust accumulates in such large quantities that the evaporation falls and combustion may even take place partly in the stack instead of under the boiler. Where Lancashire boilers are to be fired, it will therefore generally pay to install a gas-cleaning plant, even at the expense of the sensible heat which is lost in the cleaning process.

Conditions are much more favourable with water-tube boilers, as with these it is often possible to clean the tubes without stopping the boiler. If liberal use is made of the steam lance, the proposition to put in a cleaning plant will certainly not be such a favourable one as in the case of Lancashire boilers.

The cheapest plant is not worth having, unless it fulfils the following conditions:—

1. The gas must be clean.
2. It must be dry, and this is even more important than the cleanness.

In some cases where the gas can be cooled to a temperature of 80 deg. C. without water injection, and where the ores contain only a small percentage of moisture, it is possible with a dry cleaning plant to obtain a dry, hot gas; whereas, where wet cleaning processes are used, or where water is injected for the purpose of cooling the gas, the gas is saturated and this water has to be eliminated.

So far as the author can discover, the cost of cleaning gas, inclusive of all charges, is about 2d. per 35,000 cu. ft., and is practically the same whether the wet or the dry process is used.

The sensible heat in blast-furnace gas per cubic foot is approximately as follows:—

Temperature of gas, deg. C.	200	250	300	350	400
Sensible heat, therms per cu. ft.	7	9	11	13	15

As cold blast-furnace gas varies from about 90 to 110 therms per cu. ft., this sensible heat is a large percentage of the total heat of the gas. Firing water-tube boilers with properly designed burners, and using the steam lance, say, twice a day to clean the tubes, the efficiency with uncleaned gas is certainly within 10 per cent. of the efficiency with cleaned gas—probably within 6 per cent. On the other hand, with Lancashire boilers the average efficiency over four or six weeks with uncleaned gas is very considerably lower than with cleaned gas.

The decision as to whether it will pay to clean gas must therefore be made for each case separately, and depends on the peculiarities of the gas and of the dust, as well as on the kind of boilers used.

Heat Transfer.—Gaseous fuel as usually burned does not give the intense local heat and the heat-radiating surface of the coal fire. Rather, the problem is that of a very hot gas which is cooled gradually as it travels through the boiler. It is like the problem of a coal-fired boiler with the fire-grate entirely outside.

The transfer of heat through a steel wall from hot gases to water consists of three parts: transfer of heat from gas to metal, transfer of heat through metal, transfer of heat from metal to water. The resistance to the transfer of heat in the second and third parts is exceedingly small when compared with the resistance to the transfer of heat from gases to metal. It is calculated for one case that the resistance to transfer of heat from gas to metal was 622 times the resistance to heat passing through the steel. This shows that the advantage to be gained by fitting, say, copper tubes instead of steel would be very small indeed. Again, the transfer from metal to water, if the metal has a clean surface, is also negligible compared with the gas-metal transfer. If, however, the metal carries scale on its surface the case is very different. Scale $\frac{1}{8}$ in. thick, assuming the scale to have the same conductivity as plaster of Paris, of which the specific resistance to the conduction of heat is 108 times that of iron, would add resistance

to heat transfer equal to 18 per cent. of the resistance of transfer from gases to steel.

The problem of finding the most satisfactory boiler for gas firing is to be solved by the boiler which abstracts the heat most successfully from the hot gases passing. There are several lines along which improvements can be made.

The first is to increase the surface exposed to the hot gases by fixing projecting pieces inside the fire tubes, to increase the heated surface.

The second method depends on the fact that a square foot of heating surface at right angles to the gas flow is about eight times more effective than a similar area parallel to the gas flow—at ordinary velocities of gas. Deflectors or retarders are put into the boiler so as to cause the gases after they have been fully burned to impinge on the tubes as directly as possible.

A third method, and probably the one most commonly used, is to put surfaces of brick or other refractory material in the boiler in such a way that the flames play upon them. These surfaces are raised to a high temperature and transfer the heat by radiation to the boiler tubes. Such surfaces, in order to give the greatest effect, must face the boiler tubes squarely, and must be as near as possible to these tubes.

The transfer of heat by radiation becomes much more rapid in proportion as the difference between the temperatures of the two bodies concerned increases. This shows the necessity of raising our radiating surface to the highest possible temperature; and this again points to the use of the highest possible gas or air pressure in our burners in order to shorten the flame and make it more intense.

A fourth method depends on the theory that the difficulty of heat transfer from gas to metal is caused by a thin layer of cooled gas, which adheres to the surface of the metal and acts as a non-conductor. The stream of hot gases is made to scour very rapidly the surface of the tubes, and in this way the cooled gas is swept away and fresh hot gas is constantly applied. Very rapid heat transfer has been obtained by this means.

The author has had no experience with the Bonecourt boiler, but it is claimed by the makers that the heat is taken out of the gas by means of surface combustion on blocks of refractory material in the tubes, and that the heat is transferred by means of radiation from this material. Whether or not there is any surface combustion in the process as carried on in their latest boilers, the author thinks it likely that the high velocity of the gases through the tubes, in close contact with the walls and heating the refractory blocks, may be sufficient to account for the evaporation per square foot claimed. The suction required—16 in. water-gauge for the larger evaporations, equivalent to a velocity of about 250 ft. per second—would seem to bear this out. Unfortunately, it is a costly matter to get these high suction for the very large volumes of hot gas with which we have to deal in boiler firing.

Each of these methods involves either the use of power or the insertion of some obstruction in the boiler. Boiler users object to have any kind of brick erection inside a flue, as it may burn away and require renewal, and it must be removed to clean and inspect the flue. The author considers that for existing boilers the method of increasing the heating surface by the use of some kind of metal fitting in the flues is the one least open to objection. Power for forced draught or suction is a charge against the boiler, and its cost must be deducted from the efficiency of the boiler. To put the gas—or air—under 2 in. pressure, in the case of blast-furnace or producer gas, requires power which would only reduce the boiler efficiency by $\frac{1}{3}$ to 2 per cent., whereas the additional efficiency attained may be from 10 to 20 per cent.

Types of Boilers.—Lancashire boilers are used very largely, and have to be utilised in the best way possible for gas firing. It is a pity that three-flue and five-flue boilers are not more often used, as they not only give a larger heating surface, but also allow of smaller volumes of gas being burned in each flue. With smaller volumes of gas it is easier to burn the gas with a small excess of air. A disadvantage of the Lancashire boiler when gas-fired in any of the usual ways is that the fall of temperature in the gases from one end of the flues to the other is not sufficient to set up good circulation of the water, as is done by the intense local heat of the fire when the boiler is hand fired. In spite of all that is said against gas-fired Lancashire boilers, they will continue to be successfully and economically used. The author has experience of regular evaporations of over 9,000 lb. per hour from and at 212 deg. F. from ordinary 30 ft. \times 8 ft. boilers, both with producer gas and with blast-furnace gas, which is far higher than what we should expect from a water-tube boiler.

The author's idea is to have a boiler with a considerable number of smaller tubes, forcing the gas to burn at the highest possible temperature in each, and to have no obstructions in the tubes, and no mechanical suction. Such a boiler, properly insulated, would give at least as good results as the best water-tube boiler.

Wherever high-pressure boilers are to be installed, there is little doubt that water-tube boilers will be chosen if the available feed-water is soft enough and can be suitably treated. It is important that sufficient combustion space should be provided for the huge volumes of gas, so that the gas may be fully burned before passing through the tubes. External combustion chambers should be avoided as causing unnecessary

losses by radiation and conduction of heat, and because the highest temperature is not attained in the immediate vicinity of the tubes.

A good boiler should evaporate about 80 per cent. of its load in the first bank of tubes, 15 per cent. in the second, and 5 per cent. in the third. The third bank is thus practically an economiser, and this accounts for the fact that the maximum evaporation of water-tube gas-fired boilers per square foot of heating surface is usually only $5\frac{1}{2}$ to 6 lb. per hour. In a large Stirling boiler fired with coke-oven gas and evaporating $5\frac{1}{2}$ lb. per square foot of heating surface, the temperature of the steam was 290 deg. C., the temperature of the gases leaving the boiler was only 238 deg. C., and the temperature of the feed water was 55 deg. C.

When judging a boiler, it will be safe to take the results obtained from coal-firing, as we can be certain that if the same boiler is fitted with good furnaces and arranged for gas-firing it will do somewhat better. In any case, where gas-firing is concerned the choice of the right combustion arrangement is much more important than the choice of the best boiler. Up-to-date boilers do not differ in their results when coal-fired, and, when the same stokers are chosen, by more than 5 per cent. at the outside; whereas, when it comes to gas-firing, one combustion arrangement can easily do 50 per cent. better than another.

Another important question is the arrangement of superheaters in gas-fired boilers. When gas-fired boilers are arranged for hand-firing and gas-firing, the nozzles of the burners are, as a rule, too near the superheaters, so that in a good many cases the superheat imparted to the steam is too large. Superheated steam pays as long as the superheat is not more than 85 deg. C. The heat added to the steam over and above that is practically lost, unless the steam is carried a very long way and loses part of the superheat in transit. It is, therefore, essential that the distance between the superheaters and the nozzles of the burners should be if possible more than 10 ft., so as to ensure that the superheater does not come into contact with the burning gas.

The ideal boiler for gas-firing has not yet been developed. There is no doubt that a water-tube boiler which is arranged so that the gas can be fully burned before passing through the tubes, and where the gas stream is kept at right angles to the line of the tubes by careful baffling, is the best boiler we have so far. To get higher outputs from such a boiler per square foot of heating surface is a matter calling for more rapid combustion of the gas, with more intense flame temperature, and this can easily be arranged where required.

The author has never come across a water-tube boiler with small diameter tubes, such as, for example, the Yarrow boiler, gas fired. It seems probable from the theoretical point of view that the Yarrow boiler would give excellent results. As the tubes are only about 1 in. diameter, the proportion of heating surface touched by the gases, to the wetted surface of the tubes, is much larger than in the usual forms of water-tube boilers. As also the tubes are only about $\frac{1}{2}$ in. apart, the waste gases must pass between them at a high velocity. For these reasons the author would expect to get a high output and economical results with this type of boiler.

(To be concluded.)

DISCUSSION IN LONDON.

The discussion was opened by Mr. C. P. SPARKS, who welcomed a paper on what was a new subject to them. The author dealt with gas and how to handle it; he wished that it had dealt rather with the sources of gas, which was the first matter of importance to the electrical industry. In burning solid fuel for steam generation, all the volatiles were lost, and it was recognised that the method must be altered; the chemical industry was dependent on coal by-products. Considering coal distillation, in coke production gas was a by-product, and in gas production, coke was the by-product; there was also low-temperature distillation, in which gas and other by-products were obtained. He asked were they to put their stations at the coke ovens or at the gas works, or wait the development of further processes. Their problem must be considered from the power engineer's point of view, which was that of securing heat units; it must be approached from a new standpoint. The Fuel Research Committee were considering how best to use fuel so as to meet all the objects in view, and the matter was also being investigated by important commercial undertakings. The question for electrical men was how they were going to get the gas. Coke manufacture took place primarily at the pits, and in most cases water was not abundant there, so that this crippled the use of steam turbines in such a locality; in addition, the question of transmission was involved. To utilise products of existing gas works would decentralise power production, instead of concentrating it, as desired.

Mr. W. B. WOODHOUSE emphasised the importance of a steady gas pressure for successful gas firing. The point in gross and net calorific values was to know which was being used. He thought the author was optimistic in his estimate of 6,000 cu. ft. of gas per ton of coal for coke ovens, while the figures for blast-furnace gas were extremely high. The important question was how much gas was surplus after completing all processes (including blowing), and he estimated

this as worth 1s. 6d. per ton of pig produced; in this country very few blast-furnaces had any surplus, and it was difficult to get successful firing with a gas containing so much inert matter. If it were necessary specially to dry gas, it was a question whether it would pay.

Mr. E. W. L. NUNOT said he felt that gas was too good for boiler firing, and the pressing need was the development of a furnace for burning coke on a large scale. As regards waste heat, with present practice gas-works coke was drawn from the retorts at 1,800 deg. F., and contained 43 per cent. of the heat used in making it; it was usually quenched in water, but there was no reason why it should not instead be dumped into a furnace, and the heat utilised at the gas works. The problem of conveying gas to a station of, say, 100,000 kw., was a huge one, some 23 million cu. ft. of 150-in. dia. producer gas per hour would be required; and ordinary coal gas was out of the question.

Mr. H. W. KOLLE remarked that the use of blast-furnace gas was more difficult than would appear from the paper. Pressure variation was a serious question, also there was the difficulty of adjusting air supply to gas supply. The author's figure of 25 per cent. excess air with blast-furnace gas was too low; in practice it was usually 100 per cent. Where there was pressure variation in the main, the air was adjusted for the maximum pressure. It was not so easy to carry out a test on gas-fired plant using dirty gas, and he did not know of any case where means was provided for controlling pressure. He thought there was not much in cleaning gas, and felt that the whole matter required much further consideration. With producer and coke-oven gas, the pressure could be regulated, but he thought the author had given a wrong impression as to blast-furnace gas firing.

Mr. J. D. PATON urged electrical engineers to study the question of combustion; they must appreciate flame colour and make the utmost use of the CO gas, which was the heat giver. Some 25 million tons of coal were wasted annually, in the heap, lost in mains or in the mine, and our fuel authorities had not attempted to deal with this matter. A large part of this fuel was only suitable for distillation, and the coke would contain so much ash that it could only be used in a producer for gas making.

Mr. W. R. COOPER said the paper was valuable as an analytical one, and as, no doubt, gas-firing would come they must be prepared to use it. It was difficult to find the quantity of gas used in industrial processes, but if used for industrial firing they must know its quantity and heat value. He thought that in the future attempts would be made to make more use of radiant heat in gas firing; in the producer the efficiency would be improved by reducing the steam used. But the commercial future of gas-firing depended very much on the realisation of the value of by-products. Low-temperature coke could be best used in producers, and for this reason the low-temperature carbonisation processes were worth considering.

Mr. W. H. PATCHELL criticised the variation from practice of some of the author's figures. The question was whether coal could be more economically turned into electricity, and, with gas firing, it turned largely on the by-products. Coke was a difficult by-product to burn, and involved extra transport, and it would be advantageous to use it in producers for gas making.

Mr. J. H. HIGHFIELD said the discussion revealed the fact that there were numerous sources of waste heat, and it was clear that the latter must be used in the form of electricity, but this still left the problem of producing the major part of the energy which would be required, and of using some form of gaseous fuel in its production. It was difficult to get any figures to go upon; in a fair-sized steam plant one might get 900 units per ton of coal costing 20s. To obtain this by gas-firing would require 14 tons, costing on the same basis 25s., and if it were assumed that sulphate of ammonia and some tar were obtained as by-products valued at 10s., then the net fuel cost would be 15s., leaving 5s., which would about meet the extra financial charges. In the case of a gas engine of, say, 1,000 h.p., 900 units could be generated on 6 ton of coal, costing 12s.; by-products might fetch 5s., leaving 7s. as the net coal cost.

Mr. A. H. DYKES said we must utilise all waste heat in the future; we were now doing so in part. Then we had to consider the capital question of large stations. With gas firing this would involve the chemical and metallurgical industries, and therefore the form of gas would no doubt be decided for the electrical engineers, and they must therefore consider how to use any probable form of gas available. Figures were required; there was too much mystery attaching to the results now obtained. Special types of boiler would have to be designed to meet the conditions, and a subsidiary advantage would be the labour saving.

Mr. C. P. TAYLOR said the author showed 30 per cent. of the heat value thrown away in producer work, the only justification for which was the by-products obtained. High fuel costs would upset all calculations unless the price of sulphate of ammonia also went up. It was questionable whether it would be profitable in a small scheme to transmit electricity rather than gas.

Mr. L. B. ATKINSON urged that too much stress must not be laid on the by-product value of sulphate of ammonia; they must look to oils and other chemical by-products. No one would use sulphate of ammonia if he could get nitrates (which

would be produced electrically), and would be available at a lower price per ton in more suitable form for agricultural purposes.

Mr. H. M. SWALES asked if any attempt had been made to clean gas by centrifugal methods?

The AUTHOR, in his reply, said he had not dealt with the manufacture of gas. Dry gas meant gas in which the moisture had been extracted by ordinary methods. The tendency was to put in cleaning plants for blast-furnace gas, which flattened out pressure variation, giving reasonable uniformity; some classes of gas must be cleaned or solidification of the dust would occur. With clean gas, economisers could be used without scrapers. It was difficult to substantiate figures for efficiency, but with a good boiler and economiser he would hope to secure an efficiency of 85 per cent. with coke-oven gas, and about 80 per cent. with clean blast-furnace gas. The efficiency of the Bonecourt boiler was probably due to gas velocity and radiation.

PARLIAMENTARY.

(Concluded from page 526.)

The following applications for powers are set out fully in notices published in the *London Gazette* for November 27th:—

Canvey Deep-Water Wharf and Railway.—New company to construct wharf, railway, dock, and other works; electric generating stations; working railway by steam or electricity; supply of electrical energy.

Yorkshire Electric Power Co.—New and further powers, as to supply; obligations upon local authorities, companies, and others obtaining powers in future to take supply of energy in bulk from the company; provisions as to Joint Boards or Committees, &c.

Sheffield Corporation (Consolidation).—Various powers respecting tramways, trolley vehicles, and electric supply.

Shropshire, Worcestershire & Staffordshire Electric Power Co.—Various additional powers, extensions of existing powers, &c.

Doncaster Rural District.—Electrical Distribution of Yorkshire, Ltd., seeks a Provisional Order for supply in a number of parishes and townships in the rural district of Doncaster.

Gildersome.—Electrical Distribution of Yorkshire, Ltd., seeks a Provisional Order for electricity supply.

Luddenden Foot and Mythelmroyd.—Ditto.

Rotherham Rural District.—Ditto.

Hoyland Nether U.D.C.—Amendment of E.L. Order, 1912, extension of time.

Werkington Corporation.—Provisional Order for electricity supply.

Sheffield Corporation.—Electric supply extension powers for urban districts of Handsworth and Dronfield and a number of parishes in other districts.

Clayton and Queensbury.—Electrical Distribution of Yorkshire, Ltd.—Provisional Order for supply in Clayton and Queensbury urban districts.

Thorne.—Electrical Distribution of Yorkshire, Ltd.—Provisional Order for supply in Thorne Rural District.

Guiseley and Menston.—Electrical Distribution of Yorkshire, Ltd.—Provisional Order for Guiseley U.D. and Menston parish.

The following notices appear in the *London Gazette* for November 30th:—

Gainsborough.—Application by J. Marshall, Gainsborough, for Electric Lighting Provisional Order.

Knottingley U.D.C.—Alteration, &c., of 1911 E.L. Order.

NEW PATENTS APPLIED FOR, 1917.

MACHINERY FOR THE WORK OF RECONSTRUCTION.

THE reports of the removal by the common enemy of all kinds of machinery and plant from Belgium and the occupied districts of France have been so frequent during the past two years that it is impossible to disbelieve them, and it may therefore be assumed that almost everything which can be utilised by the enemy has been, or will be, seized or destroyed in order to prevent the return to the rightful owners of property which could be advantageously used by the Allies, and also in connection with the gradual military advance. On the other hand, some machinery and plant may have been destroyed or greatly damaged by inadvertence through the gun-fire of the Allies in the promotion of the forward movements, as it is not possible absolutely to prevent incidents of this kind. In any case, the devastation caused to property by the war has been enormous, and will necessitate a stupendous expenditure for the work of restoration after the conclusion of peace. What this outlay may approximately amount to it would be exceedingly difficult for us to determine, but the leading iron and steel interests in the United States have not been deterred from making an inquiry into the situation, or from the formulation of estimates which are based upon an investigation made by a committee which paid a visit to Europe in the autumn of last year.

The report prepared by the committee was presented at a meeting held at Pittsburg. It shows that, in the opinion of the committee, the reconstruction requirements owing to the destruction of public and private property would represent an aggregate of £1,200,000,000 in the case both of the western and eastern fronts, £750,000,000 applying to the former and £450,000,000 to the latter. Apart from buildings, raw materials, and manufactures, the report calculates that it would be necessary to expend a total of £270,000,000 on industrial machinery in Belgium and France, £12,000,000 on agricultural machinery and implements, and £85,000,000 on railways, bridges, and tramways. If the figures for the two countries are considered in detail, the restoration of the coal and iron ore industries would involve an expenditure of £60,000,000, the iron and steel and metal industries one of £75,000,000, the chemical industry £8,000,000, and the electrical industry £36,000,000, apart from the separate outlay for the textile, paper, wood, and furniture branches. It is assumed that Belgium alone will have to import industrial machinery to the value of from £20,000,000 to £24,000,000, or six times more than corresponding imports in peace times, whilst France herself will probably be able to produce three-fourths of her own requirements in machinery, leaving one-fourth, or the value of £12,000,000, to be procured from abroad in the first year of peace. In the case of Germany, it is computed that the country will be under the necessity of importing machinery worth £6,000,000 per annum in the first years of peace; Galicia is put at £4,000,000, and Poland at £49,000,000 for works and machinery.

The foregoing estimates, as previously mentioned, only apply to the autumn of 1916. Since

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE 1-4, LUDGATE HILL, LONDON, E.C. 4.

Telegraphic Address: "AGEEKAY, LONDON." Code, A B O.

Telephone Nos.: City 997; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, £1 1s. 6d.; Canada, £1 3s. 10d. (\$5.80). To all other countries, £1 10s.

FOREIGN AGENTS:

ADELAIDE: Messrs. Atkinson & Co., Gresham Street.

AUCKLAND N.Z.: Gordon & Gotch, Albert Street; The Mining and Engineering Review, 31A, Strand Arcade, Queen Street.

BRISBANE: Gordon & Gotch, Queen St.

then, however, the further havoc which has been made would naturally imply a formidable addition to the aggregate figures. Apparently on the assumption that the machinery and plant would be obtained exclusively from the United States, the American interests calculate on the flotation there of a great reconstruction loan by means of which gold shipments would be avoided, and the rates of exchange in Europe be but slightly influenced. On the other hand, a Zurich newspaper, which is published in German, states that it is an open question whether the reconstruction of the destroyed districts will proceed quite according to the American programme. With the entrance of the United States into the war that country also assumed enormous war burdens, and changed over her industries to war work to a far greater extent than previously. As a consequence, the Swiss-German newspaper submits that the United States will in no respect be able so promptly to compete after the conclusion of peace as was assumed by the committee, and that it remains to be seen whether the Americans will be able to offer machinery in countries of the European Allies at prices which would secure the business. On the other hand, the newspaper expresses the hope that Swiss engineering firms, particularly the electrical industry, will find specially favourable prospects open to them for the export of machinery and plant.

It is quite obvious that any estimates concerning the reconstruction of the devastated countries are of no practical value at the present moment. At the same time, it has to be borne in mind that the American computations were made prior to that country's participation in the war, and that, therefore, some prospect previously existed that American firms would secure a very considerable amount of the business which will result from the work of restoration. This assumption, however, has been greatly modified by the association of the United States with the common struggle for justice and freedom from the military domination of enemy countries, and under existing circumstances American firms cannot expect to obtain more than their due proportion of the machinery contracts which will come forward on the conclusion of peace, provided that the requisite shipping facilities are available for transport from the United States to Europe.

Literary Style.

AMONGST the "Random Reflections" of our valued contemporary, *The Engineer*, last week, we noted with especial interest an essay on a subject which appeals to us, but seldom figures in the technical Press—namely, the use and abuse of the English language. We wonder whether the average engineer fully appreciates the importance to him of the study of English and the cultivation of a good literary style. Often a practical man whose conversation on technical subjects derives from his expert knowledge a peculiar fascination will tell us that he cannot write an article—all unaware that he has already composed it, and that nothing is lacking but the written record of his observations. Such a man might with advantage try the experiment of engaging a stenographer to set down his remarks addressed to a real or imaginary brother engineer whose experience has run along different lines; he would probably be surprised and pleased to find himself the author of a very readable and informative article—which, moreover, would possess a cash value far in excess of the stenographer's fee.

Our confrère attributes the worst faults of composition to two causes: on the one hand an attempt to write too well, and on the other an absolute indifference to the graces of style. The former leads to the introduction, usually misplaced, of flowers of

speech, and hackneyed literary clichés or stock phrases, with disastrous effect upon the reader; a plain tale, told in simple Anglo-Saxon, is the best from every point of view, and every superfluous word is a defect. Of the two classes, we prefer the latter; it may be largely due, as our contemporary holds, to the practice of dictation to a shorthand writer (which is not the same thing as the process which we have suggested above, in which the speaker should forget the existence of the stenographer)—but in many cases we think it arises from an impression that it gives a practical and technical air to the work, whereas it is merely slovenly and affected.

Prominent amongst the defects in the latter category are the omission of the definite article, and the use of the expression "the same" (or the barbarity "same," a heinous crime) in place of "it" or "them," as in the sentence, "Take cloth off table and put instrument on same." These offences against good taste and good English are unspeakably horrible, but they are, unfortunately, very commonly committed. That trap for the unwary or inexperienced, the collective noun, to which our contemporary draws attention, is the source of innumerable errors in the daily Press; we also have made it our practice to treat all such nouns as singular, and find that this course almost invariably meets the case, whereas if the plural is used endless difficulties are encountered. Thus, "This committee has commenced its work" is inoffensive; but to say "This committee have," &c., would mean torture to the reader, and "A committee are sitting" is equally unpleasant. The limitations of our space forbid us to refer to the many other literary solecisms which are constantly being met with, and we must conclude by emphasising again the importance of good English to the engineer, as to every other professional man.

The Kinema and Industry.

WE were interested recently in an effort that was being made in the States to utilise the cinematograph as a means of popularising industrial, commercial, and other information respecting manufacturing operations—showing how things in common use are made, and under what conditions. Two lecturers of the Bureau of Economics (Washington) were recently lecturing in the U.S.A., with the aid of kinema films, on various Canadian topics, and one of the outcomes expected is the attraction of emigration and capital to Canada. There is a charm or fascination about such a procedure which renders the cinematograph a far more useful popularising medium than mere lecturing or ordinary pictures. The kinema film has proved its applicability to boosting "electrical development" schemes among the general populace in the States. Life and movement have an irresistible effect. How far would it be possible similarly to demonstrate our more prosaic industrial activities in works in the United Kingdom to the great markets of the world where too little is known about our abilities? We have seen electrical factory operations and processes admirably represented by kinema film in London. How far is the idea adaptable or applicable in helping us to inform the world and expand our trade abroad where, at times, quite wrong notions as to our capacity have been held? We attach great importance to the placing of actual British-made machines and apparatus in colleges abroad, where students will in daily operations become familiarised with them, and to the circulation of brochures containing excellent pictures of our manufactories. Is it worth considering whether, where we cannot send permanent exhibits, we can provide a peripatetic film for the edification of students, institutions, chambers of commerce, and so forth, in the great purchasing centres of the world?

THE EDUCATION AND TRAINING OF ENGINEERS.

By "RADIX."

(Concluded from page 533.)

One of the most careful thinkers of the last century has told us that "false ideas can be refuted by argument, but by true ideas alone can they be expelled." Whence are "true ideas" to come, and how are they to be inculcated? Surely not by the exercise of the rational faculty alone. What is termed "reason" varies in different individuals, in different races, and in members of the same race in different parts of the world, and under different conditions of life.

Reason—as understood by most of us who do not indulge in philosophical analysis—may perhaps be described as a co-ordination of facts of experience and of inferences and deductions therefrom. To some people "reason" and "common sense" are synonymous terms. At any rate, the "reason" upon which this non-religious age would have us base our ethical ideas is a state of knowledge arising out of experience or the accumulated results of experience. But, clearly, knowledge based upon experience is necessarily subject to modification as experience becomes wider and fuller. How can morality find any permanent basis in reason alone? All attempts to formulate a code of morals upon reason alone have failed, and *must* fail, since the basis is a variable, and not a constant, one.

Bishop Butler seems to have given us about as good a definition as is possible of the fundamentals of morality in the following words:—"For, as much as it has been disputed wherein virtue consists, or whatever ground for doubt there may be about particulars; yet, in general, there is in reality an universally acknowledged standard of it. It is that which all ages and all countries have made profession of in public; it is that which the primary and fundamental laws of all civil constitutions over the face of the earth make it their business and endeavour to enforce the practice of upon mankind: namely, justice, veracity, and regard to common good."

Whence arise the ideas of "justice, veracity, and regard to the common good"? Not from the exercise of reason alone. It is all very well for materialists and other "ists" to say that ages of experience have shown that without due regard to these ideas a community does not prosper. Grant that this be so (although this does not account for the *origin* of these ideas); grant that reason forces one to give an intellectual assent to the truth of this contention; we all know that "there is a wide difference between the formal assent given to a proposition that cannot be denied, and the efficient belief which produces active conformity with it." In the absence of that "efficient belief," what becomes of the intellectual assent? Is it not common experience that the first question a business man (and, for the matter of that, pretty nearly every man) asks himself in regard to any proposition, business or otherwise, is "What am I going to get out of it?" and if he concern himself at all with what the other chap gets out of it, it is only to enable him to see to it that the other fellow gets as little as possible. Justice and the common good, to say nothing of veracity, become quite secondary considerations.

Herbert Spencer—who certainly did not *profess* to be a religious man—acknowledges that "Were it possible forthwith to replace a traditionally-established system of rules, supposed to be supernaturally warranted, by a system of rules rationally elaborated, no such rationally-elaborated system of rules would be adequately operative. To think that

it would, implies the thought that men's actions and beliefs are throughout determined by intellect; whereas they are in much larger degrees determined by feeling."

Herbert Spencer seems to imply that the antithesis is a "consummation devoutly to be hoped," but he is wrong, as is also Tennyson when he sings "We have *but* faith; we cannot *know*, for knowledge is of things we *see*." The fact is that the greatest and most certain part of our knowledge is of things we do not *see*. The whole edifice of scientific knowledge is built upon three principles which we only *feel* must be true, and which do not admit of logical proof:—the principle of uniformity in Nature, the principle of identity, and the principle of causality.

Similarly, the recognition of right from wrong, of good and evil, and the ideas of "justice, veracity, and the common good of all" are *felt*, not *known*. Whence this certainty based upon "feeling"?

I do not hesitate to say that, as a result of 30 odd years' experience of men and things on both sides of the Atlantic, there seems to me, philosophically and scientifically, no escape from the conclusion that the origin of the moral sense is to be sought in an "Eternal power not ourselves which makes for righteousness," and that the only satisfactory exposition of Matthew Arnold's abstract conception is to be found in the Christian faith as originally professed by this country.

So long as the great majority of the children of the masses are brought into the world under the conditions now prevailing; so long as the minds of the young are allowed to develop during their most impressionable years in such surroundings and exposed to such influences and examples; so long as the inculcation of the sense of responsibility to God the Creator and Preserver of all mankind is left out of account in the education of the young, so long will the pernicious doctrines of the positivist, the anarchist, and other "ists" continue to flourish and do their deadly work in perverting the morality of humanity.

One word in conclusion. The view is often expressed that if a man conduct his business on the lines of the Sermon on the Mount, he will find himself in the bankruptcy court sooner rather than later.

In a sense this is perfectly true. It is, however, equally true that the sense in which it is true is *not* the sense in which the Founder of Christianity would have men conduct their business. The admonitions in the Sermon on the Mount are counsels of perfection for the individual, and do not apply to the administration of collective justice. If a man smite us on one cheek, we are not enjoined to turn somebody else's cheek to the smiter. A man may be as charitable as he pleases with his own money, but he must not deal with other people's money as he likes. A judge may submit to be swindled and not have recourse to his legal remedy without thereby, even impliedly, sanctioning the swindling act, but he must not, in the exercise of his office, compel those who are swindled to act likewise. Although our Lord never avenged any injury done to Himself, He nevertheless dealt with those who were defiling the Temple in drastic fashion. He did not waste words in argument, but punished the infraction of the moral law, which was subversive of public morality, by overturning the tables of the money-changers and driving out these breakers of the moral law *by force*.

There is a virile, as well as an emotional, side to the Christian religion. The undue predominance of the emotional over the rational is as dangerous—as regards the common good—as the undue predominance of the rational over the emotional.

We should aim by education to bring about that proper equilibrium "between introspective thought and the outer world of action" which involves the

recognition that justice "is a positive, affirmative force, which entails active duties as well as passive rights."

Huxley, who may be termed, at least, an unbiased witness, expressed himself as "seriously perplexed to know by what practical measures the religious feeling, which is the essential basis of conduct, was to be kept up, in the present utterly chaotic state of opinion on these matters, without the use of the Bible"; and in the same essay* he writes: "If I were compelled to choose for one of my children between a school in which real religious instruction is given, and one without it, I should prefer the former."

Unless Mr. Berriman's Committee—or some other authority—recognise and act upon this governing factor as a root principle in education, they will no doubt turn out skilled men, but not "good" men; their efforts will be productive of palliative measures only, for they will not strike at the root of the evil, and no real progress will be made towards the attainment of the goal they have in view.

MODERN ARC LAMPS AND INCANDESCENT LAMPS.

(Concluded from page 532.)

Exterior Lighting.—Where out-of-doors lighting is concerned, or the illumination of large workshops, &c., half-watt lamps have to compete with flame arcs, the characteristics of which may be thus summarised :—

	Open flame arc; carbons side by side.		Enclosed long-hour flame arc; vertical carbons.	
	D.C.	A.C.	D.C.	A.C.
Colour of light	Yellow	Yellow	White	White
Candle-power (mean lower hemispherical)	1,300—4,000	1,500—3,600	2,000—4,000	1,200—2,500
Watts per m.h.-s.c.p. (lower)	0·24—0·17	0·16—0·19*	0·2	0·25—0·3*
Burning hours: single and double lamps	17 & 35	17 & 35	150	110

* With choking coil.

In other words, the half-watt lamp has to compete with a one-fifth watt lamp, so that where current economy is im-

iciency is not, however, everything. The form of the light distribution curve is especially important in exterior lighting, the object being generally to distribute light as uniformly as possible over a wide area—reducing the intensity of illumination on ground near the lamp in order to increase illumination at more remote points between lamps.

The open flame arc with carbons side by side (fig. 5) does not give a good distribution of light, as regards producing uniform illumination over a wide area. Curve 1 (fig. 9) is the Rousseau curve corresponding to that ideal polar dis-

FIG. 9.—ROUSSEAU DIAGRAMS FOR VARIOUS LAMPS.

tribution of light which would give uniform ground illumination. The other curves refer to the several types of lamps specified in the "key" adjoining the figure; each curve is reduced to the basis of 500 watts consumption, including ballast in arc lamps, hence the curves are directly comparable. From curve 6 it will be seen that the type of lamp shown in fig. 5 gives a maximum candle-power at 50° or 60° below the horizontal instead of at about 15°. By the addition of a dioptric globe (fig. 6), the polar distribution is improved immensely, and the corresponding Rousseau curve (No. 8, fig. 9) shows quite good approximation to the ideal form. The long-hour enclosed flame arc with vertical carbons also gives a good distribution of light for wide range illumination (see curve 10, fig. 9).

Fig. 2 shows the polar distribution from a half-watt lamp in a fitting with enamelled shade (fig. 7), and curve 12, fig. 9, is the corresponding Rousseau diagram. This distribution is good from the point of view of lighting workshops, but a greater proportion of light at 15° to 20° below the horizontal and less at 30° to 90° below the horizontal are needed to provide reasonably uniform ground illumination, using lamps relatively far apart. A dioptric globe (fig. 8) may be used to improve the normal distribution of light, and thus to yield the Rousseau curve 13, fig. 9. About 10 per cent. loss is caused in light passing through a dioptric globe, as compared with 50 per cent. loss in diffuse reflection.

It will be seen that curves 8 and 13 (fig. 9) are similar. In other words, there is little to choose between a vertical carbon flame arc and a half-watt lamp (using a dioptric globe in each case), in point of light distribution. The difference lies in the higher efficiency of the flame arc, already noted.

The areas under the various curves in fig. 9 are propor-

portant owing to the cost of current or other reason, the flame arc has an immense initial advantage. Current efficiency.

* "The School Boards: What they Can do, and What they May do." (Critiques and Addresses, pp. 50 and 51.)

tional to the total light emitted by the different lamps, and we have here a very clear graphical representation of the relative efficiencies of the lamps as used in practice.

First Cost and Working Cost.—It is important to fix definitely the relative first cost of equivalent arc and half-watt lamp installations, but the difference is generally small. Individual half-watt lamps and fittings are cheap as compared with arc lamps, but more of the former are required in most cases, and there then comes the extra cost of additional wiring, switches and fuses. Part of the ballast resistance needed by arcs may be provided by using the smallest leads consistent with safe temperature rise. Half-watt lamps connected in parallel must, on the other hand, be provided with comparatively heavy leads, in order that the voltage drop may be small.

Carbon costs and the cost of bulb renewals vary with circumstances, but are generally about equal so long as the half-watt lamp fitting protects the bulb from rain and snow without subjecting it to overheating. Cheap, ill-designed fittings waste more by premature lamp failures in a year than they save in first cost, as compared with good fittings.

Attendance costs are lower for half-watt lamps than for arc lamps, but they are not negligible, for the former need a thorough cleaning once or twice a month. Maintenance costs, apart from the bulb and carbon items already considered, are much lower in a half-watt lamp installation than where arcs are used :—

TABLE II.—TOTAL WORKING COSTS OF FLAME ARC AND HALF-WATT LAMPS.

Assuming 1,760 m.h.-s.c.p. and including interest, depreciation, attendance, maintenance and renewals.

Energy cost per unit.	500 burning hours per annum.		3,000 burning hours per annum.	
	Flame arc.	Half-watt.	Flame arc.	Half-watt.
d.	s. d.	s. d.	s.	s.
0·35	45·0	37·3	171	171
0·7	51·0	51·0	220	270
1·18	60·9	71·6	270	377
1·76	73·6	95·0	343	514
2·35	88·0	119·6	415	660

The figures in Table II compare the total working costs (interest, depreciation, carbon and bulb renewals, attendance, and maintenance) for a flame arc lamp and a half-watt lamp, each of 2,000 hefners hemispherical (1,760 h.-s.c.p.), assuming various prices for energy and 500 and 3,000 working hours per annum. Under some conditions the advantage of lower cost lies with the arc ; under others with the half-watt lamp. So it is also with the general merits. Sometimes it is advantageous to have the more powerful units in which arc lamps are obtainable, the yellow light, well penetrating smoke or steam, and the rugged construction, unaffected by vibration and rough handling. Sometimes the glow lamp is chosen on grounds of more convenient wiring, lighter equipment, and easy maintenance by unskilled persons. If the current be very cheap and/or burning hours short, the glow lamp may show, in addition, a saving of money.

The conclusions indicated by these notes are that the gas-filled tungsten lamp is entirely preferable to arc lamps in lighting small and medium-sized interiors, especially where semi-direct or indirect lighting is practised. For lighting open spaces or large, lofty shops, both flame arc and gas-filled tungsten lamps will continue to be used. In such service, both types of lamps have their advantages and disadvantages, and choice can be made only by consideration of individual circumstances.

Loose Switches.—When Annie E. Hovey, a Scarborough boarding house manageress, was summoned, last week, at the local Court for a lighting offence, she offered the defence that the vibration of the door had caused the electric switches to drop and put on the lights in unoccupied rooms. The police constable said he thought that this was quite likely, as the switches were very loose. He said the bulbs had now been taken off the light fittings. The lady was fined 5s.

INDUSTRIAL CONDITIONS OF TO-DAY.

By "OUTSIDER."

WE notice in one of the week-end papers the formation of a new alliance between employers and employed. The objects in view are stated as follows :—

1. The securing of a living wage.
2. The regulation of the hours of labour.
3. Women to have equal pay with men if work, skill and output are equal.
- 4 (and following). The improvement of working conditions and the increase in output.

During the past few weeks the columns of the REVIEW have shown a renewal of the symptoms of unrest which prevail in the power-station side of the electrical world. This trouble has been stirring for years, and to an outside the conditions imposed by the war would seem to have aggravated it. A quantity of ink is used nowadays in dealing with labour questions in arranging promising schemes for the *rapprochement* of masters and men. The majority of these plans are unfortunately, however, mere in the nature of pious hopes, which it is to be feared will never cut much ice. Strikes and rumours of strikes appear in the Press, and letters of complaint in the technical journals, re the poor prospects of this or that branch of the industry, and in conversation with the man in the street one hears threats of trouble to come after the war. The aims of the new alliance above set out would seem to provide adequately for the worker, whereas the employer only just sneaks in at the finish for an increased output. However a little ventilation of these points will do no harm, and may even save some disappointment. Without confining attention exclusively to the power-station workers, or any one branch, a few notes may be made as to the existing industrial conditions.

Taking the items as they stand, the wage question is, a matter of course, first. It is not easy to-day to define living wage. Wages expand and prices soar in regular alternation. There are those who hold the opinion that wages and prices are engaged in an insane competition, the result of which is not at present clear. Apparently the worker who secures a living wage is the one whose Union is powerful enough to enforce its demands for an incremental step by step with the increase in the prices of life's necessities. The others take their chance among the "also rans." The farm labourer gets 30s. per week, the unskilled factory hand and the semi-skilled a little more or less, according to their job and locality. Skilled people draw all sorts of rates, from three guineas standard upwards, and in places like Sheffield men and boys are paid unheard of wages. The clerical worker contents himself with a war bonus, the amount of which depends sometimes upon a new constant—the extent to which his employer's profits are liable to excess profit tax. We do not cavil at this, but merely mention it by the way. There were, we remember, firms who reduced their salary bill at the outbreak of the war in order to economise ; we wonder if those salaries are still limited and reduced. Apparently power station attendants are not sharing in the big rises. The pay of another State servant—the ordinary Tommy—is grossly unjust, and especially so in the case of one who has risen from the ranks and is without private means. Some workers, therefore, are overpaid and some the opposite. It might not be impossible for one of our enormous new Departments to take the wages question in hand, and to standardise them a little ; this would ensure more equality of treatment than prevails at present. We are all controlled, and the State is the one tribunal which possesses the necessary authority to set the matter upon a proper basis, at least for the duration of the war. Few will quarrel with our opinion we imagine, that the large prices are more due to high wages than the reverse.

The second point, hours of labour, is regulated to-day solely by the grim necessity which war imposes and the shortage of labour intensifies. Most people have to work very long hours, and the consideration of the working day is, therefore, more in the nature of an after-war proposition. The claim for equal pay for the same work as between men

and women is interesting and opportune. Whether our experience is representative or not, it goes to show that as yet women's pay is less than men's pay by at least 25 per cent. Further, signs are not wanting that the intention of employers is to substitute women for men permanently. We have no desire to lay down the law to employers, who are free to train women as they may. At the same time, most of the men so replaced are in the trenches to-day, and as many of them as do return will want work. This points to a reduction in wages some day as a direct result of female competition. The new alliance will score heavily on the side of the men when it secures equality of pay by increasing the woman's wage, yet care may be necessary, or the process will be *vice versa*.

The several remaining points on the list refer to conditions of work and increased output. Output, judged by prevailing standards, would seem to call for no special worry. The war has done more for it than all the Blue-books, technical schools, institute proceedings, and political parties have accomplished in two or three decades. Output is soaring, but conditions of work are bad. Workers jeopardise their fellows' lives by criminal carelessness; strikers still down tools and barter for more money. Thousands of married women workers whose job ends with the war are subject to a weekly deduction on account of unemployment insurance, for which they will get little or no return, because they will not claim it. Employers still advertise for "junior" assistants in large power stations at small wages, when there are no juniors about, save returned disabled soldiers. Men must do this job or that, or go into the Army. Others, with Tribunal influence, are excused service on condition that a munition works receives them. These latter are often of little use, yet others who have been years in the same works have to go, willy-nilly, into the ranks. The presence of an Irish labourer on a farm has sent many a married Englishman into the Army. These are all, as our American Allies say, "some" conditions. The Minister of Labour proposes to establish we know not how many new labour exchanges. More to the purpose would be a systematic visit to our labour centres, in and out of some of the 5,000 controlled works; there he might find food for serious thought. All the eminent speakers skate round the subject most carefully, and exhale pious platitudes. The workers are heart and soul in the war; the pacifist occupies a lonely furrow, but profits and prices are so distended that unrest in some quarters is inevitable. The man in the street is sated with the written homilies which have rained on him lately as to what he must or must not do, while he sees others making their own commandments. It will be taken as a sign of the *bona fide* intentions of the people who talk so much of conditions after the war, if and when a small instalment of reform is instituted in the near future while the war is on.

NOTES FROM CANADA.

(FROM OUR SPECIAL CORRESPONDENT.)

On October 24th, in a small town of some 25,000 inhabitants, named Brantford, in Ontario, a monument was unveiled to commemorate the invention of the telephone by Dr. Alexander Graham Bell. The inventor himself was present, and related how, in the summer of 1871, his discovery was made, in Brantford, apparently owing to much experimental work having been carried out in Boston in those early days, some people have been under the impression that the telephone was actually invented there, but Dr. Bell stated that he was "glad to be able to come home and say that the telephone was invented here" (in Brantford).

The Duke of Devonshire, Governor-General of Canada, un-

veiled the monument, which is described by a daily paper as follows:—

The memorial stands upon an elevation in a small square in the heart of the city. In the centre, in a marble setting, is a great bronze bas-relief symbolising the transmission of sound through space, while mounted upon columns on either side are bronze figures representing humanity in touch. The conception of Walter Allward, the sculptor, is strikingly original, and its execution a remarkable piece of work.

According to *Conservation*, a small monthly bulletin published by the Commission of Conservation, a new Order in Council has recently been passed by the Dominion Government to preserve to the public the ownership of water powers on Dominion lands. This Order provides that, whenever any Dominion lands are disposed of in future, that portion of them necessary for the protection of a water supply or bordering on, or close to a water power, and necessary for its development, will be conveyed only on a year-to-year lease. A provision to this effect is to be inserted in all letters patent. Apparently the Commission of Conservation takes some credit to itself for the passing of this Order.

The demand on Canada's great water powers for the supply of electrical energy is growing very rapidly, in the Provinces of Ontario and Quebec particularly, the war undoubtedly being chiefly responsible.

In Quebec, the Shawinigan Water & Power Co. expects before the end of this year to have 18,000 h.p. additional business. Various large companies taking big blocks of power have very greatly increased their demands; the Carbide Co. alone is said to be taking 10,000 h.p.

A transmission span 5,000 ft. long, with 350-ft. towers, is being erected over the St. Lawrence at Three Rivers. The Southern Canada Power Co. is planning extensions on a very big scale, and various others are proceeding on similar lines. The particular company named intends erecting 88 miles of high-tension transmission lines connecting up a number of cities.

The *Electrical News of Canada* for October 15th last con-

THE TELEPHONE MEMORIAL AT BRANTFORD, ONT.

tains an article by Mr. B. L. Steele, Professor of Physics, State College, Washington, in which the efficiencies of various types of cooking ranges are given. The following are interesting:—

Flame contact burners (kerosene, gas, &c.)	20 p.c. to 35 p.c.
Electric heaters, surface	45 p.c. to 65 p.c.
Electric heaters, enclosed	70 p.c.
Electric heaters, immersion	90 p.c.

Very great care appears to have been taken to account for all factors which would affect the relative results.

In British Columbia there are reports that various companies will spend considerable sums of money on power development. The Kootenay Power Co. intends building a high-tension line to cost about 2½ million dollars, and the Canada Copper Co. will spend a similar amount on work at Copper Mountain.

The power situation in the Province of Ontario is becoming very awkward, due to the immense demand for electric power for munitions purposes. No doubt this demand has been augmented, apart from other causes, by the high price of coal (bituminous coal costs from two and a half to three times as much as before the war), and by last year's actual shortage, when it was almost unobtainable; but this does not alter the fact that the Hydro-Electric Power Commission will this winter be hard put to it to find enough power to go round. Already the Toronto Hydro-Electric Commissioners are advertising in the daily papers requesting people to use as little current as possible, even in their homes, between the hours of 1.30 and 6 in the afternoon.

Sir Adam Beck, the Chairman of the Provincial Commission, is urging the Dominion Government to stop, or largely reduce, the export of electrical energy at Niagara Falls, so as to leave as much as possible available for Canada's own needs, enabling the munitions factories to continue their opera-

tions unhampered by lack of power. Rather naturally, the United States' firms who have been purchasing this power for years, and whose power requirements for war purposes have been increasing very much in the same way as those of Canadian firms, protest against the power being taken from them. What the Dominion Government will do in the matter remains to be seen; at present it is probably a somewhat delicate international question, for both sides appear to be in a position to argue that the power is required for war work.

Another question which is before the Government just now is the application made by a private corporation to build a dam across the St. Lawrence river at Cornwall, Ont., with a view to hydro-electric development. The Commission of Conservation, which has already done much good work in looking after the rights of the Canadian public in respect of water powers, has taken the matter up, and is strongly supported by the Hydro-Electric Power Commission of Ontario.

It may not be generally realised in England that this Commission, in addition to having actually developed two water powers of small size at Wasdell's and Eugenia Falls respectively, and to supplying power from several other moderate-sized plants in the Province which have been taken over, recently took over the entire plant equipment and property of the Ontario Power Co. at Niagara Falls; the Commission is now operating this large station for itself.

The great Chippewa development scheme is also in hand now, preliminary work having been started some little time ago. This scheme involves the building of a canal from Chippewa (above Niagara Falls) to a point near Queenston, some 13 miles in length. By this means, besides getting all the head of water available at the Falls, amounting to about 165 ft., a further 130 ft. or so, due to the difference in level between the foot of the Falls and Queenston, is made available, thus almost doubling the power obtained for each unit quantity of water.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Prohibited Imports.

May we appeal through your columns to all lovers of fair play for assistance and advice?

Your readers know that we have introduced into this country thousands of public-utility devices essential for economy, and of a design not manufactured in this country, but urgently needed at the present time. In spite of the importance of these goods, a total prohibition has been placed on their importation. "Hotpoint" heating and cooking apparatus has not only done, and is doing, good service here, but it is in the unique position of being guaranteed for long periods.

This prohibition is not only on new goods, but on spare parts necessary to enable us to carry out our obligations. Thus, not only is a new business being unnecessarily destroyed, but our good name for straight dealing is jeopardised by this refusal to grant us permission for repair parts to the extent of *even one cubic foot per month*.

How is it that at least two English concerns are still able to continuously advertise American electric vacuum cleaners? These were prohibited in June, 1916; we, the actual American makers, have had none since! Again, import licences have been granted to approved flash-lamp importers for between 25 per cent. and 50 per cent. of their 1916 imports—this, we agree, is valuable merchandise; an unknown proportion go into useful and important service, while an equally unknown proportion are idle toys. Could not some of the tonnage thus wasted be utilised for important coal and labour-saving goods which are not, and never have been, manufactured in sufficient quantities in this country?

Why not have a fair arrangement? Either definitely prohibit all such goods if competent, unbiased authorities advise such a course, and make no exceptions and favour none, or else grant permits for 10 per cent., 20 per cent., or some percentage of previous trading, so that we can all at least exist, and retain our good name, for which we have worked, and of which we are proud.

Hotpoint Electric Heating Co.

L. G. HAWKINS, Manager.

London, W., December 4th, 1917.

P.S.—Expressions of opinion, assistance, and advice from central-station engineers and dealers would be appreciated.

The E.T.U. or the A.E.S.E.?

I have noted for some weeks past that a controversy is proceeding in your columns between the E.T.U. and the A.E.S.E. While some good points have been discussed, the vital point has always been side-stepped, viz., the actual status of the "charge," or "shift" engineer. It must always

be remembered that while an engineer does not wish to be deemed snobbish, at the same time he has to preserve discipline amongst his men, and it cannot be denied that should an engineer join the same society as his men, there are some who would be quite ready to take advantage of it, and so spoil all the good that would otherwise accrue. At the same time, an engineer cannot afford to ignore the men altogether, for it is quite possible for those men to run the job without him, should his society decide to take "industrial action," or whatever other form of attack they decide upon. The only course open to him is to join a society that has a working agreement with that of the men. In my way of thinking, "industrial action" is to a great extent unnecessary, as has been proved since the outbreak of war by the settlement of cases by arbitration, which, though not what we may call absolutely satisfactory, has at least been accomplished without the privations and inconvenience of strikes. Before closing, I should like to endorse Mr. Vincent's letter, in which he practically advocates the fusion of all unions catering for the electrical trade. At present I only know of one union that caters for all grades, and that is the National Amalgamated Union of Enginemen, Firemen, Mechanics, Motormen and Electrical Workers, who represent practically all the generating stations in London.

W. H. Streeter.

London, N.W., December 10th, 1917.

Diesel Engine Fuel.

"Pulveriser's" article, "Diesel Engines and the War," is very timely, and ventilates a real grievance of Diesel engine users.

"Pulveriser" suggests that the present situation in regard to the use of Diesel engines has arisen out of the system whereby each Government Department works in its own water-tight compartment, and is quite oblivious to what is happening beyond its own limited horizon. The facts appear to confirm "Pulveriser's" view. How else are we to reconcile the Creosote Controller's order, dated October 23rd, 1917, limiting the use of tar oil for Diesel engines, with the unofficial hint dropped from an official source about 12 months ago to "adjust your Diesel engines to burn tar oil"? Or the Ministry agreeing, less than six months ago, to munitions concerns extending their existing Diesel engine plant with further Diesel engines?

If the Navy must have all the tar oil in the country, then is it not the Government's duty to ensure a supply of suitable petroleum oil, at reasonable prices, for the Diesel engines already installed? Perhaps they cannot altogether control foreign oil companies, or insist upon English oil companies importing the fuel into the country, but they can at least fix a reasonable figure upon insurance rates for ship and cargo.

A number of contracts made between a large English oil company and sundry Diesel engine users, the contracts dating from 1916, may now have to be modified or cancelled. That, at least, is the oil company's suggestion. They have asked their customers under contract with them to accede to an increase of £5 a ton over and above the contract price "to cover part of the Government insurance rate on ship and cargo." They go on to state that when the contract was entered into insurance rates were a few shillings a ton, whereas now they are 20s. a ton. The oil company have made a bad bargain, and, from the ethical point of view, it is to be regretted that they should write to their customers suggesting modifying or cancelling the contract. But from the commercial point of view, Diesel engine users require to be assured of future supplies, and it is, therefore, desirable that the oil company should not be too hardly hit. The right and graceful thing for the Government to do is to revise the basis of insurance rates, fixing them at the price ruling at about the time when the above-mentioned contracts were made. The method of achieving this is suggested by "Pulveriser," namely, for the various Departments concerned to have a conference on the matter. To settle the fuel-oil problem for Diesel engines, representatives of the following Departments should confer:—

1. Admiralty (Fuel Oil Control).
2. War Office (Recruitment Department and Contracts).
3. Coal.
4. Food.
5. Shipping.
6. Railway Transit.
7. Creosote.

A decision arrived at in this manner would be accepted as fair at least by the majority of Diesel engine users, who would then know that their complaints had received due attention.

Flameplate.

Electricity and Agriculture.

It may be taken as agreed that there is to be a great development in the service that electricity is to yield to agriculture, the only wonder being that so little has been done already.

One of the chief reasons would appear to be the complete lack of intercourse between the two professions, and as a practical suggestion for getting over this difficulty I would propose that the Institution of Electrical Engineers should,

together with the representative societies of agriculture and horticulture, appoint a joint committee whose duty it would be to investigate the problems, and put them in the way of being solved.

It should be the duty of such a committee to arrange inter-society meetings for the reading and discussion of suitable papers, thus bringing into closer intercourse the two interests concerned.

The idea need not be confined to agriculture; as it is, our learned societies work too much in "water-tight compartments," and a closer collaboration would tend to produce greater efficiency all round.

E. S. S.

[Our correspondent is evidently unaware of the existence of the I.M.E.A. Committee on the Development of Electricity in Agricultural Areas, and, in common with others in a similar position, seems to call for more energetic propaganda by the Committee. It may be noted, too, that the Agricultural Committee of the Conjoint Board of Scientific Societies, which is also investigating this matter, is representative of both agriculture and engineering.—EDS. ELEC. REV.]

HEAT ENGINES.

IN the Thomas Hawksley Lecture at the INSTITUTION OF MECHANICAL ENGINEERS, on November 30th, Capt. H. RIALI SANKEY, C.B., R.E., outlined the history of various forms of prime movers. He said that the prevailing commercial custom with the steam engine was to state the number of pounds of steam per I.H.P. or B.H.P. or K.W.-hour, but this led to serious error in the case of engines running with superheated steam, and was contrary to the recommendation of the Committee on Engine and Boiler Trials of the Institution of Civil Engineers in 1897, which adopted the theory of equivalent feed, expressed as follows:—

Equivalent feed = actual feed \times heat required per lb. of steam/11,100.

With low degrees of superheat the error was not very great, but with high degrees of superheat the error was considerable. For example, in a test on a battery of steam turbines of 200 B.H.P. running at 3,000 R.P.M., steam pressure 195 lb., superheat 200° F., and vacuum 28.7 in., the steam consumption given in the ordinary way was 8.5 lb. per B.H.P., but, according to the equivalent feed formula, it was 9.6 lb., an error of 11.5 per cent. In a second case there was an error of 28 per cent. Therefore, the heat economy of steam engines should be quoted in terms of equivalent feed, or preferably, in the number of B.T.H.U. required to produce one I.H.P.-hour.

Reciprocating engines were gradually being replaced by the steam turbine for electric power station work, and to-day the slow-speed reciprocating engine was practically defunct for this purpose.

It was unfortunate that the suggestion by Thwaite, in 1895, to use blast-furnace gas led many engineers to the conclusion that large gas engines generally were practical. They did not recognise the difference between blast-furnace gas and producer gas. The result was that many firms took up the manufacture of gas engines, but had to drop out, so far as the majority were concerned, after losing much money.

The figures of heat economy for steam, gas, and oil engines had shown little improvement of late years. The practical limit had been reached, and there was little, if any, further improvement to be looked for. The best results now obtainable were:—

	B.T.H.U. PER I.H.P.-HOUR.
Steam turbines	11,000
Gas engines	10,600
Diesel engines	7,700

Both gas and oil engines had reached their limit as to size, but the steam turbine could be built in much larger units than had yet been attempted. Therefore, notwithstanding the considerably higher heat economy of gas and oil engines compared with the steam turbine, the latter would hold the field for large units, both for land and marine service, the reason being that it was a true rotary engine, and it would occupy this position until a satisfactory gas turbine was evolved. A few small experimental gas turbines had been built; so far, however, there had been no real progress, the main difficulty being to obtain material for the blading which would withstand the very high temperature of the impinging gas. There was also to be considered the loss due to compression of the combustible mixture of gas and air, which loss greatly reduced the intrinsically higher thermal efficiency of the internal combustion engine so that under the best conditions it was not likely that the practical economy of the gas turbine would be more than a few per cent. better than that of the present gas engine. An experimental gas turbine must be of a very large size, and private enterprise would not be justified in incurring the great capital expenditure which would be necessary. The real object was to utilise the world's fuel supplies—coal, oil and peat—to the best all-round advantage, and to that end increasing attention was being paid to devising means whereby fuel should not be burned to obtain heat until the so-called by-products had been separated. The recovery of by-products would

only be economical in very large plants, and the same might be said of the generation of electricity in this way. Consequently, it might be expected that in the future coal and peat would be gasified in producers of such a character as to recover the maximum amount of by-products, and that the remaining gas would be used for generating electric power. Generally the monetary value of the by-products was greater than that of the heat-producing element of the fuel; hence, when they had been separated, it might be said that the cost of the fuel would be negligible. In fact, it would be the gas which was the by-product. From this it followed that the small percentage of economical gain in the gas turbine would be largely reduced in value. There was, therefore, justification for the conclusion that the gas resulting after the separation of the by-products would be used under boilers for generating steam for driving large turbo-generators.

WATER SUPPLIES AS SOURCES OF POWER.

By CECIL H. ROBERTS, M.Inst.C.E.

(Abstract of paper read before the INSTITUTION OF WATER ENGINEERS.)

MANY waterworks are in a position to generate power from the water before it reaches the service reservoirs, and in some cases, especially in districts far from coal supplies, water power could be generated and supplied at a reasonable cost. Some watersheds are capable of supplying as much as 100 million gallons of water per day from a considerable elevation, and the difference in level between the impounding reservoirs and the service reservoirs varies in different waterworks up to and over 500 ft.

Assuming that the surplus power available between the impounding reservoir and the beginning of the aqueduct amounts to 500 H.P., this could be utilised to operate turbines driving dynamos, and the electric power so generated would be sufficient to provide all the light and power required by a town of considerable size: the revenue obtainable, with very reasonable charges, would be in the neighbourhood of £15,000 per annum, sufficient to warrant a substantial outlay of capital on the necessary works.

A further advantage of combining power plant with upland waterworks lies in the fact that, as storage works on a large scale are often an essential part of a waterworks, a small proportion only of the cost of such works would be chargeable against the power scheme, and the outlay on pressure pipes, which would probably be comparatively short, ought not to be heavy.

A proposal to use for lighting and power purposes the power (about 400 H.P.) available at the Longdendale works of the Manchester Corporation was reported on by Sir Alexander Kennedy as long ago as 1899: although nothing was done at that time, hydro-electric works have since been constructed for utilising some of the power locally by Mr. Holme Lewis, the present water engineer of Manchester. Dr. Deacon, in 1902, described how a portion of the surplus power in the aqueduct of the Vyrnwy Works was utilised at Oswestry to operate "Brotherton" engines. More recently in the Birmingham Waterworks water turbines and dynamos have been installed for using a portion of the power available in the compensation water.

When the difference between the level of the impounding reservoir and that of the town to be supplied is considerable, it may be at times possible, without prohibitive additional cost, to construct the power house at a distance from the impounding reservoir and at a lower level, in order to secure a greater pressure at the turbines and utilise a larger proportion of the potential power. Although such a case might be complicated by compensation questions it would afford some advantages, such as the possibility of taking additional water from neighbouring watersheds, and thereby increasing the capacity of the power plant, and the reduction of cost of the machinery due to the greater head of water. The cost of generating power (the load factor remaining the same) varies inversely with the power and the pressure of water.

In some districts small towns or villages in the neighbourhood of the works could be supplied with electricity in bulk for lighting and power purposes; in other districts, light railways, saw mills, wool pulping, mines, quarries, chemical and other works might be supplied on mutually advantageous terms, and in the future agriculture should also provide a market for electric power; in fact, there should be few districts in which a market could not be obtained or created.

Opposition might be raised in Parliament to the combination of works for the joint supply of water and power, but in view of the national value of cheap power for industrial purposes and the necessity of conserving coal supplies as much as possible, such opposition might not be great.

In the discussion which ensued, Mr. A. J. E. Binnie said that, acting on the instructions of the Ministry of Munitions, his firm last August looked into the question of water-power possibilities. He had come to the conclusion that in this country they had between 200,000 and 300,000 H.P., which could be developed at prices starting at £2 10s. up to about £6 10s. per H.P.-year.

The general trend of the discussion went to show that it was only in the West Highlands that there was anything like sufficient water power available to make the generation of electricity possible on a paying scale in the British Isles, owing to the want of altitude of our water-bearing hills.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

The "Halo" Reflector.

The "HALO" Co., of 7, Exchange Buildings, 6, St. Mary's Gate, Manchester, have placed on the market an easily fitted reflector ring for incandescent lamps, which is employed in the manner shown in fig. 1. The reflector ring is of glass, English-silvered, and provided with three adjustable copper clips to enable it to be fitted to the lamp bulb; it increases the downward light to a

FIG. 1.—"HALO" REFLECTOR IN PLACE.

marked degree, as, indeed, is shown by a National Physical Laboratory test in which it was found that with the reflector there was 24.6 c.p. under the axis as compared with 4 c.p. without it—a 200-volt, 40-watt, ordinary metal filament lamp being used.

The reflector is slipped over the bulb before inserting the latter in the holder, and is shown in the view level with the base of the lamp filament.

A Simple Lock Washer.

In a letter to *Power*, Mr. P. H. GRIGSBY, of Gloucester, Ohio, describes a lock washer which he has used for several years, and which is effective, simple, and easily made. In the illustration A is a slot in the washer, and B is a small hole at the same radius as C, which is a small cone-shaped projection. When used on metal, he says, "place the washer in position and with a centre punch

FIG. 2.—LOCK WASHER FOR WOOD OR IRON.

make a depression through hole B, rotate the washer until projection C fits into the centre-punch mark, screw down the nut, and turn up the edge of the washer at slot A, alongside of the nut. When used on wood, no punch mark is necessary. This washer can be cheaply made by a single operation of a punch press."

LEGAL.

TRAMCAR COLLISION CLAIM.

IN Dumbarton Sheriff Court, the Anglo-Swedish Electric Welding Co., Ltd., Glasgow, claimed £302 from the Dumbarton Burgh and County Tramways Co., Ltd. The action was a sequel to a collision between a motor-lorry and a tramcar. The Sheriff decided that the collision was directly due to the fault of the driver of the tramway-car, and found the defenders liable to the pursuers in damages, which he assessed at £266, with expenses.

SOLDIERS' TRAMWAY FARES.

AT the West Riding Court, last week, the Magistrates heard a test case as to travelling facilities for a soldier. The Yorkshire (West Riding) Electric Tramway Co. summoned Corporal Robert Brown, of the Royal Defence Corps, a guard at a neighbouring internment camp, for travelling on a car and refusing to pay full fare. Up to

a few weeks ago soldiers had been allowed to travel at half-fare, but the privilege was withdrawn, and now artisans, mechanics, or daily labourers were the only people allowed to travel at half-fare. Defendant claimed to be a daily labourer as much as any other workman, and said soldiers took it as an insult that they should be excepted because they wore the King's uniform. The case was adjourned for a week for consideration.

GAS LIGHT AND COKE CO. v. HACKNEY BOROUGH COUNCIL.

(Continued from page 537.)

ON December 6th, Mr. A. J. Walter, K.C., continued his address on behalf of the respondents, the Metropolitan Borough of Hackney, in support of the judgment of Mr. Justice Astbury. He said that in the Long Eaton case a power user who took light made his load factor worse, and yet was charged less per unit, though the station was worse off by his taking light, as its plant was used fewer hours each quarter. In Hackney a light user who, for each unit he used for light, had under the scale to use 4 units for power, greatly benefited the station by using the plant for more hours each quarter, and was rightly charged less per unit for his total supply than was charged to a mere light user with his worse load factor. No case had been suggested of unfair discrimination between power users; and, in fact:—

1. On the scale complained of, every power user had the same right of using 20 per cent. of the total supply for lighting.

2. The scale complained of was only available for factories and workshops. If a man used power alone he paid less per unit on his maximum demand scale than the man who used power and light, owing to the automatic working of the load factor.

MR. COLEFAX then replied on behalf of the appellants.

On December 7th, Mr. Colefax concluded his arguments, and their Lordships reserved judgment.

HOLT v. A.E.G. ELECTRIC CO., LTD.

IN this case, to which brief reference was made last week, a settlement was arrived at in the Chancery Division on December 5th, before Mr. Justice Younger.

Mr. Holt claimed salary under an agreement, notwithstanding that he had been called to the Army. The company, which is wound up under an Order of the Board of Trade, under the Trading with the Enemy Act, by its Controller, admitted that this was a case in which a payment might be made, but raised the objection that under Sec. 1, Sub-Sec. 7, of the Act, this action could not be brought without the consent of the Board of Trade.

HIS LORDSHIP directed that the sum agreed upon in Chambers should be paid to the plaintiff in full settlement of his claim, holding that the section relied upon did not preclude the plaintiff from bringing his action without the consent of the Board of Trade.

WAR ITEMS.

Exports to China.—The "London Gazette" for December 11th contains further names of persons and bodies in China to whom exports may be consigned.

Shipbuilding.—The Minister of National Service has issued a special appeal for suitable men employed in non-essential undertakings to take up unskilled work in shipyards. It is considered that men who are doing work that women could do should volunteer, but they must possess the necessary physical strength for work in shipyards.

Trading with the Enemy.—The "London Gazette" for December 7th contains further lists of persons and bodies in the following countries with whom trading is prohibited:—Argentina, Paraguay and Uruguay, Bolivia, Brazil, Chile, Denmark, Greece, Hayti and Dominican Republics, Netherlands, Netherlands East Indies, Norway, Peru, and Spain.

Tungsten Ores.—In the "London Gazette" for December 7th there is printed in full the new Order of the Ministry of Munitions applying Regulation 10A to tungsten ores, molybdenite and metal, and products therefrom, and requiring returns.

Trade Policy.—Last week we quoted a reference by the *Daily Chronicle* to the recommendations of Lord Balfour of Burleigh's Committee on trade after the war. The *Daily Telegraph* understands that there are three documents—a majority report and two minority reports. "One of the minority reports, signed by Lord Faringdon and others, advocates the imposition of an *ad valorem* tariff of 10 per cent. on imported manufactured and semi-manufactured goods, lower duties to be imposed by arrangement with foreign countries. There is a Free Trade minority report, which is against a general tariff. The majority report, which is supported by some of the Free Trade members of the Committee, takes a middle course. It advocates a tariff on imported manufactured and semi-manufactured goods, the maximum to be below 10 per cent. It is believed that the three reports concur in recommending that special steps be taken to preserve key industries, such as aniline dyes and optical glasses. Other industries important to the national well-being, which have been restarted during the war, ought to be preserved from the effects of foreign competition until thoroughly established."

Exemption Applications.—At the request of the National Service Representative, Fulham Tribunal reviewed the certificate of conditional exemption granted to an electrician, 39, married, passed for general service. The respondent said he was engaged in installing electrical plant at a glycerine works on behalf of a Queen Victoria Street firm. Official documents were produced showing that if the certificate was cancelled his retention would be claimed by the Ministry of Munitions. In reply to the Chairman, the man said he worked 11 hours a day seven days a week. The Tribunal decided to make no variation.

The Manbre Saccharine Co., Ltd., opposed an application to the Fulham Tribunal to vary the certificate of conditional exemption granted to an electrician in their employ, aged 39, married, who was granted conditional exemption a year ago. He had charge of the electric lighting and power plant, and was responsible for all fittings and telephones. He had been with the firm for 12 years, and had only one assistant. The machinery was running continuously, and the man frequently had to work all night in addition to his regular work seven days a week. No variation was made.

At Newhaven, temporary exemption was sought by E. Hilton (18), assistant engineer at the Rottingdean electricity works. The engineer (Mr. J. W. Brown) said that there were only himself and Hilton left at the works, and he would be content if the Tribunal allowed exemption until daylight-saving came in force next year, as then he would be able to manage without him. The Tribunal refused the appeal, but Captain Boyne undertook that Hilton should not be called up until March 25th, the Chairman saying that that meant that he would not have to join the Army until 10 days after that date.

An electrician in business in Saltergate appealed to the Chesterfield Tribunal for exemption for an assistant (18, grade 2), but the appeal was rejected.

At Weymouth, Messrs. Brooking & Co., electrical engineers, appealed for H. J. Barrow (31, Class A), wireman. His certificate of conditional exemption has been withdrawn, and he was given temporary exemption until Feb. 28th.

The East Sussex Appeal Court heard an application for extended exemption made by an electrical engineer at Burgess Hill (41, B1). He said that he had sole control of a generating station supplying, among other things, power and light to munition factories, and that he had been urged to undertake further supplies for munition works. Major W. W. Grantham (National Service Representative) submitted that, having regard to the time already given to appellant, arrangements should now be made. The Court allowed three months' open exemption.

At Reigate, an appeal was made for exemption for C. W. Read (36), shift engineer at the Corporation electricity works, on the ground that he was indispensable and in a certified occupation. He was given conditional exemption.

At Windsor, Mr. N. L. Jackson, Stoke Park, applied for exemption for V. H. Froud (37), electrician, and six months' temporary exemption was allowed.

At Chatham, Messrs. Barnard appealed for exemption for H. W. Whittaker (18, grade 3), electrician at the Theatre Royal. Exemption was refused, with 28 days' grace.

BUSINESS NOTES.

Christmas, 1917.—We shall be glad if readers, contributors, and advertisers will note that the greater part of our issue of December 28th will have to go to press some days earlier than usual, owing to the Christmas Holidays. A notice by our advertisement department appears elsewhere in the present issue. We shall be glad if advertisers and contributors will forward their "copy" and manuscript much earlier than usual. New advertisement copy and alterations to existing insertions should be received by Friday morning, December 21st.

New Co-operative Scheme to Develop British Export Trade. Mr. G. C. Mandleberg, chairman and a managing director of Messrs. J. Mandleberg & Co., Ltd., Pendleton, Manchester, has placed before British manufacturers and producers the outline of a scheme on national lines for the direct encouragement and development of the British export trade.

The main proposal is to organise British manufacturers and producers into a body for the specific purpose of securing more orders from overseas. Mr. Mandleberg suggests the formation of a corporation to develop trade in old and more especially in new markets for the mutual benefit of members. The method proposed is to make available for all firms in the new British Manufacturers' Corporation, which is the title suggested, the means which business experience shows to be the most effective in developing foreign trade. This is the employment of representatives abroad, men of first-class ability, and possessing thorough knowledge of the business conditions in the different foreign countries to which they will be appointed, and where they shall be resident. They will be known, it is suggested, as agents-in-charge. They will find and appoint the right men as local selling agents for individual firms, get first news of fresh trade openings, report on the standing of possible customers, and generally superintend the

business interests of all firms in the organisation. The result, it is suggested, would be to give every firm in the organisation the advantages of a branch in many parts of the world without the expense of establishing and maintaining it. Mr. Mandleberg contemplates an organisation of a 1,000 members subscribing £100, or £200 each per annum. With a fund of £100,000, or £200,000 per annum, he suggests, very strong inducements could be offered to likely men to be agents-in-charge. The latter would have adequate staffs of experts to assist them, and a code system could be devised to facilitate prompt communication. Mr. Mandleberg points out that no existing organisation covers this ground, while the scheme would be complementary to the new Government proposals for helping overseas trade. We are informed that the scheme is being widely discussed in Lancashire, and is being actively supported by manufacturers there. It is intended that steps shall shortly be taken to form a provisional Committee, and formulate the scheme in detail.

To electrical manufacturers and traders the argument that only by increased output, as compared to pre-war production, shall we be able to carry the inevitable increased taxation, and maintain increased wages to meet the extra cost of living after the war, is already very familiar. If we are at the same time to quote competitive prices, the cost of production must be reduced by the adoption of the most modern improvements.

The demand for this increased output is to be looked for partly by a larger demand from the home market, and largely by a big expansion of the export trade. As we have urged for many years past, we shall have to find new markets and to intensively encourage the existing ones. For many firms in the electrical trade, especially the smaller ones, this will best be effected by co-operative action either in production or in salesmanship or in both. The electrical industry knows this well enough, and efforts are being made in a number of directions. Probably they would have been far more widely adopted and more energetically pursued had not the uncertainties and prepossessions of war-time imposed a handicap. It has long been recognised that our industry will be most efficiently served by specialised representatives; everybody knows that in the past the general representative dealing in all things in common, with electrical manufactures sandwiched in somewhere or other, has not been a successful British electrical trade-getter. Whether under Mr. Mandleberg's scheme it will be possible to give our large department of specialised technical industry that peculiar representation that it unquestionably requires, will doubtless be answered by electrical manufacturers for themselves. As a general export trade organisation there is doubtless great scope for the proposed British Manufacturers' Corporation, and it may be that some of our smaller firms may find it good policy to investigate the scheme and give it their support. We therefore quote below the main functions which it is intended to perform:—

1. To superintend selling arrangements for every firm in the organisation.
2. To appoint selling agents for individual firms or combinations of firms where agents have not hitherto been appointed.
3. To report, where desired, on the standing of purchasers.
4. To carry out, if desired, any financial arrangements between producers and purchasers where transactions lie outside ordinary business routine.
5. To act in an advisory capacity to members if they need information as to the best methods of securing further trade.
6. To get early information of possible orders and communicate immediately with the local agents of manufacturers concerned. Where no local agents have been appointed, the information could be conveyed to the home manufacturers.
7. To act as legal representative of any firm in the corporation should any dispute over goods arise.
8. For the purpose of facilitating communication between manufacturers and their agents it would probably be desirable to open offices in the chief manufacturing centres here, with a small staff in each. A code system could then be devised as a medium of communication between the home centres and the agents-in-charge everywhere.

The corporation would have as its one and only object the encouragement of direct trade on the lines indicated. It would not be a corporation for the earning of dividends. The entire benefits would go to members. Control could be vested in a board of directors selected with particular reference to their knowledge of the export trade in the various countries.

Siam.—According to a recent official return, the imports of electrical goods and apparatus at the Port of Bangkok during the last fiscal year attained a value of £65,770, as compared with only £31,610 in 1915-16.

Electrical Machinery in British Malaya.—A section of the annual report of the Senior Warden of Mines in the Federated Malay States is devoted to the inspection of electrical plant in use in the country. From the last report, by Mr. W. Eyre Kenny, M.Inst.C.E., it appears that in the F.M.S. alone there were 80 installations of generating plant in 1916, of which 50 were in the State of Perak and 22 in Selangor. The employment was as follows, in kw.:—Mining, 7,918; agricultural, 200; general, 228; Government, 10. In kw. it was allocated as, follows:—Power, 7,936; lighting, 2,865, giving a generating aggregate of 10,801 kw. Government plant was responsible for most of the lighting. The above figures refer only to generating plant driven by prime movers. There is, in addition, motor-generating plant in use of about 400-kw. capacity. The h.p. of motors employed aggregates about 10,250, the increase from the previous year's figure of 9,000 being due mainly to the inclusion in last year's return of auxiliary and converting plant in Kuala Lumpur electric light station. Mr. Eyre Kenny reports that the larger power plants, which are, perforce, controlled by first or second-grade electrical engineers, are, as a rule, kept in good condition; smaller mine-lighting plants, which are generally controlled by native chargemen, supervised by Europeans, who have little or no electrical knowledge, are not so satisfactory.

The statistics of the Imports and Exports Department of the Straits Settlements show that the United Kingdom supplies most

of the electrical machinery and accessories in use in British Malaya. For four years the total value of imports and exports was as follows:—

		Imports.	Exports.
1913	...	£73,978	£8,321
1914	...	50,898	13,046
1915	...	39,690	23,705
1916	...	11,203	21,336

The United Kingdom's share of the 1914 imports amounted to £39,108, Germany's to £13,310, and the United States' to £2,075. The statistics for 1913 are compared below with two war years:—

	1913.	1915.	1916.
United Kingdom ..	£58,415	£39,795	£33,450
Germany ..	9,474	221	—
Denmark ..	973	415	883
Japan ..	827	931	1,784
United States ..	787	1,598	2,310
Italy ..	649	884	1,610
Sweden ..	427	—	—
Austro-Hungary ..	160	—	—
Netherlands ..	184	1,391	580
Hong-Kong ..	—	—	1,198
China ..	—	—	732

The only figures calling for special mention in the above table are those of the Netherlands, which suggest that possibly German exports found a way out through Dutch ports. It is easy to understand how the United States and Japan have been able to expand their markets in the Far East during the present upheaval in Europe; but the statistics for Hong-Kong and China are less easy to explain, unless it be that the enterprising engineering firms of Hong-Kong and Shanghai have carried their enterprise into new fields of manufacture. More likely this is a transit trade of which the original port of shipment is lost for statistical purposes. To anyone unacquainted with the trade of the Straits Settlements ports, the proportion of exports may appear high. As a matter of fact, only a small proportion of the exports leave the Malay Peninsula for Siam and the Dutch Indies, most of the goods being exported by rail to the hinterland provided by the Federated Malay States, which took £6,195 in 1913, £19,921 in 1915, and £13,871 in 1916. In the latter year, the un-Federated Malay States took electrical machinery and accessories valued at £3,470, and as the Malay Peninsula is being rapidly opened up by railway and road communication, there should be a growing demand for machinery of all sorts in this region after the war.

Catalogues and Lists.—BRITISH THOMSON-HOUSTON CO., LTD., 77, Upper Thames Street, London, E.C. 4.—76-page illustrated catalogue of wiring installation accessories, covering their standard types of material in general use, such as lampholders, switches, wall plugs, ceiling roses, cut-outs, distribution boards, fuse boxes, wood blocks, insulators, &c. The list is conveniently arranged in five sections, each dealing with a particular type of accessories. The outer half of each page is given up to the illustrations, and the inner to descriptive and other details of the devices. No prices are included in the list, owing to the price fluctuations in this class of material under war conditions; but the company issues regular monthly quotations on such material. Among the lines of particular interest in the list are:—New line of porcelain type Goliath-Elison screw lampholders designed to comply with the requirements of the Admiralty and other Government Departments; new substantial designs of brass-cased Goliath holders; standard bayonet and Edison screw holders, in both porcelain and brass case types; the "Quiklok" cover ceiling rose, which can be wired on the bench and secured in position on the ceiling by a quarter turn of the wrist; the B.T.H. interlocking switch plug; also a line of new pattern distribution fuse boards and a new range of insulators.

MESSRS. ALFRED HERBERT, LTD., Coventry.—Illustrated postal card showing their First-Aid Cabinets for factories.

BRITISH THOMSON-HOUSTON CO., LTD., Rugby.—Twenty-page descriptive list (No. 2,180), giving full details with illustrations, tabulated data, dimensions, and shipping particulars, respecting their vertical spindle induction motors.

Book Notices.—*The Inspection of Screw Gauges for Munitions of War.* By H. J. Bingham Powell, M.Inst.C.E.—We have received this pamphlet from the author, the Inspector in Charge, Department of Gauges and Standards, British Ministry of Munitions of War in the United States; it was written to assist gauge makers and manufacturers of munitions of war in acquiring accurate gauges, by standardising their own methods of inspection. While this question is of vital importance, it is an exceedingly difficult one, and has occupied the attention of a number of experts of the highest standing for some years past, especially since the outbreak of war. The author describes various methods of accurately measuring the pitch of screws, including a machine devised by himself, and deals also with the measurement of the three diameters of the threads of plug and ring screw gauges. The pamphlet will prove of great interest and utility to all manufacturers whose work involves the production of screw gauges accurate within very narrow limits.

We have received a copy of the *Skyscraper*, the magazine of the London Electrical Engineers (R.E.T.), a production which should take high rank amongst the many publications of the same type which have been established during the war. The December issue is accompanied by a coloured card of Christmas greetings, appropriately illustrated with a display of searchlight beams and an anti-aircraft gun, designed by Sapper Broad; with this issue the first year of publication is completed, and we note that the Editors, who, for obvious reasons, had hoped it would be the last, are now prepared to carry on for another year. The magazine is full of good stuff,

including humorous anecdotes and sketches of life on active service ("by the sea"), short stories, an essay on "Charles Dickens and Music," chess problems and puzzles, &c. It is admirably produced, and reflects great credit on the literary and artistic abilities of the staff.

"Telegraph Practice." By J. Lee. London: Longmans, Green, and Co. Price 2s. 6d. net.

"Telephone Troubles." By W. H. Hyde. London: S. Rentell and Co. Price 7d. net.

Calendars for 1918.—MESSRS. J. HOPKINSON & CO., LTD., of Britannia Works, Huddersfield, have sent us a useful wall calendar. The design consists of a large sectional view of one of the firm's valves with a block of daily date slips based thereon, while at the sides there is neatly inset in small type a complete calendar for the year.

Social.—A successful social evening, in aid of local war charities, was held by the employees at the Phoenix Dynamo Manufacturing Co., Ltd., Bradford, and their friends, last Saturday, at a new canteen on the works. Mr. Pybus, the managing director, presided.

Anglo-Italian Trade.—The British Italian Commercial Association (Inc.) has been registered to promote the extension and development of mutual trade and economic relations between the British Empire and Italy, to collect and circulate statistics and commercial information, &c. The first directors are Mr. R. Benson, Mr. J. W. B. Pease, Sir Francis Barker, Sir Chas. L. Ottley, Sir Algernon Firth, Sir Hy. Babington Smith, and Mr. G. P. Harben (Commissioner for Italy). Secretary, Mr. J. F. Rose, 5, Victoria Street, S.W. 1.

Prices Increased.—THE STERLING TELEPHONE AND ELECTRIC CO., LTD., announce that owing to the continued advance in wages and manufacturing costs generally, they have further increased their prices. All prices in their catalogue are plus 80 per cent. advance, with the exception of switchboards and accessories thereof and C.B. switchboards, which are plus 100 per cent. advance. The advance dates from Monday last.

Liquidations.—MORRIS & WITHAM, LTD., 9, Southampton Street, Holborn, W.C.—Under a compulsory winding-up order made last October, accounts have been lodged showing gross liabilities £3,483, of which £2,159 is expected to rank against assets valued at £1,387. The deficiency to the contributories is estimated at £1,774. According to the Official Receiver's report, the company is interested in various inventions and applications for patents relating to metal-filament electric lamps, in conjunction with the late Mr. J. A. Allison; sums amounting to £89 appear to have been expended thereon, but the company's interest is valued in the statement at £50. The failure of the company is attributed to the guarantee by it of payment of an engineering company's debts.

NATIONAL PROVINCIAL ELECTRICITY CORPORATION, LTD.—A meeting of creditors is called for December 20th, at Balfour House, Finsbury Pavement, E.C. 2. Mr. S. Gillatt, liquidator.

KINGSTON & CO., LTD., Margate.—A statement of affairs issued by the liquidator (Mr. John W. Scarlett) shows a deficiency of £407. It was submitted to the meeting held last week.

INVICTA ENGINEERING CO., LTD.—Creditors must send particulars of their debts, &c., to the liquidator, Mr. F. C. Harper, 27, Chancery Lane, W.C., by December 25th.

Bankruptcy Proceedings.—SAMUEL STEPHEN COSTER, electrical, &c., engineer, who had traded at 14, Gladstone Road, West Ham, under the style of S. S. Coster & Co.—The public examination was held last week, at the London Bankruptcy Court, before Mr. Registrar Hope. The accounts showed liabilities £670, and assets, "bad book debts, £490." Questioned by Mr. E. Leadham Hough, Senior Official Receiver, the debtor said he began business in August, 1908, with a capital of £150, in partnership with one Roscoe, at 141, Bishopsgate Street, E.C. The business was not a success, and was abandoned 10 months later, all the debts being paid in full. He subsequently started a similar business alone, but used the trading style of S. S. Coster & Co. The bankrupt was examined at considerable length regarding certain purchases made by him, and eventually Mr. Hough observed, "I suggest to you that you have been carrying on what was practically a long-firm fraud by misrepresenting your status in order to obtain credit." The bankrupt denied having done anything of the sort. He was ordered to furnish cash and goods accounts, and the sitting was adjourned till January 23rd.

Auction Sale.—By order of the liquidator, Mr. J. Holmes will sell by auction, at Margate, on Thursday, December 18th, the electrical plant and stock-in-trade of Kingston & Co., Grotto Gardens (in voluntary liquidation). For particulars see our advertising pages to-day.

Trade Announcement.—Messrs. David Bone & Co., of Glasgow, announce that, owing to the new Government Act regarding the registration of business names, they have altered the firm name to DAVID BONE & JOHN McNICOL, but the constitution of the firm is unaltered.

Argentine Republic.—The imports of electrical goods into the Argentine Republic during the six months ending with June last attained a value of only £298,000, as compared with £353,000 in the corresponding six months of 1916.

Italy.—A new company has lately been formed in Rome with a capital of £160,000 and the title La Società Italiana Carboni Elettrici.

LIGHTING AND POWER NOTES.

Atherton.—The electrical engineer reports that there is a growing demand for electrical fires in the district, and a number of these have already been connected to the supply.

Ballymoney.—The Council has requested Mr. J. McClenaghan, of the Portstewart Electric Supply Co. and the Ballymoney Gas Co., to submit a scheme for the lighting of the town. Mr. McClenaghan had asked permission to erect poles for street lighting.

Batley.—PRICE INCREASE.—The T.C., last week, approved the minutes of the Electricity Committee containing an increase in charges for current for power and heating by 27½ per cent. on pre-war rates.

Birkenhead.—WAGES.—The agreement between Wallasey and Birkenhead Councils respecting the wages and conditions of labour of the employés at the respective Corporation electricity works, has been terminated by mutual consent.

Blackburn.—The Corporation has appointed a special Sub-Committee to deal with the question of the necessity of proceeding with the work of constructing the new generating station at Whitebirk.

Bootle.—EXTENSIONS.—The T.C. has agreed to an amended scheme for the provision of additional plant, at an estimated cost of £80,000, subject to the approval of the authorities.

Burton-on-Trent.—PLANT EXTENSION.—Subject to the usual consents, a scheme is to be carried out for electricity extensions at a cost of £42,290. The items which make up this total are as follow:—Turbo-alternator, £19,500; foundation for turbo, £2,000; Babcock & Wilcox boilers, complete with chimney, £9,640; settings, £800; stokers, £2,400; steam pipes, &c., £1,600; switchgear, £3,850; excavating and laying main, £1,500; alteration to roof, £1,000.

Clayton.—PROVISIONAL ORDER.—The U.D.C. has now decided to apply for its own Provisional Order for electric supply.

Cavan.—WORKHOUSE LIGHTING.—In connection with the electric lighting scheme for the workhouse, the engineer estimated the cost of plant at £529, and the clerk said the price of a 27-H.P. plant offered him was £710. It was intimated that a second-hand plant available at Sheffield at £315 might suit, and it was decided that it should be inspected.

Cork.—The Corporation has accepted the services of Mr. J. P. Tierney, of Dublin, to report on the city electric lighting plant.

Dartford.—PRICE INCREASE.—In order to meet the increase of 2s. 6d. per ton on the price of coal, the U.D.C. has increased the price of current for lighting, as from the end of the year, by 10 per cent., making a total advance on pre-war rates of 40 per cent., and for power by 10 per cent., a total rise of 45 per cent.

Darwen.—PRICE INCREASE.—The price of electricity has been increased by 10 per cent., both for motive power and lighting purposes.

Dublin.—WORKING CAPITAL.—The Corporation has adopted a recommendation of the town clerk and the city treasurer that steps be taken to secure legislation to enable the Electricity Supply Committee to borrow for working capital. An amendment for postponement until the report of the electricity undertaking for the period to March, 1916, was in the hands of the members, was rejected by 26 votes to 9.

Mr. J. J. O'Neill, in moving the resolution, said that they had been in debt to the bank £40,000 or £45,000 for the past seven years, but they had had a loan to credit. For the past four years they had borrowed no money, for their borrowing powers were exhausted. The loan being also exhausted, it was natural that the bank should feel uneasy when the £40,000 was owing and no interest payable.

Mr. Ryan said the proposal was one of the most pernicious ever heard in the Council Chamber. The Committee asked to be permitted to pay interest on an overdraft of about £50,000. He did not think the Corporation should have power to pay interest on overdrafts at the bank while money was due to the concern by consumers of current. Why were their debts not collected?

Mr. Foley pointed out that there was a deficit of £52,000 on March 31st, and urged that the Council should have before it the difference between current accounts and the amount of overdue accounts.

Mr. Sherlock said the Committee wanted to borrow money to pay wages and other charges pending the period when the consumers' accounts were paid in. The money had been got from the bank for years; but the bank now said it could not advance the money without interest being paid. The Corporation's experts told them it would be necessary to borrow £50,000 at 5 per cent. Every Corporation in the kingdom had power to pay interest on overdrafts to bankers. He mentioned Edinburgh, Glasgow, Aberdeen, Leeds, Dundee, Rathfriland, and other places where electricity had been making a profit in 1911, but where there were now losses, and said an undertaking like their own, which was able to meet increased charges and involve a loss of only £1,600 a year, was one of which they ought to be proud.

Mr. Beattie expressed regret that Mr. D'Alton's expert report on the undertaking had not been adopted. He designated the concern as a miserable failure, and argued that unless there was a complete change of management things would go from bad to worse.

Alderman Quaid said he could not see why the undertaking should be a failure, in view of the way in which it was advantaged.

Mr. Foley said it was unreasonable that £52,000 should be allowed to remain outstanding in one year. He then moved the amendment, which was defeated.

The Dublin Citizens' Association Executive has passed a resolution viewing with alarm the bank overdraft of £50,000 on the electricity undertaking, and protesting against the Corporation seeking powers to pay interest on the overdraft.

Dundee.—In connection with the reference to a Committee of the T.C. of the extension of the electricity department, Mr. Paton moved that the Committee be also instructed to take into consideration the conservation of the national coal supply at present being considered. The proposal was agreed to.

Felixstowe.—PROPOSED E.L. PURCHASE.—The Lighting Committee reports that it is of opinion that the Council should consider the question of taking over the electricity undertaking under the powers contained in the agreement, which was for a term of 25 years from November 11th, 1904, at the end of which the company was to hand the undertaking over; in the meanwhile, with the sanction of the L.G.B., the Council had to provide the capital required for extension. In the event of the Council taking it over at the end of 15 years, it had undertaken to pay to the company a sum of 2½ per cent. per annum, in respect of the unexpired 10 years, on the capital provided by the Council to November, 1919. Up to date the Council had provided £30,000, and 2½ per cent. on that was £7,500. In addition, there was some equipment which might be bought by the Council if it could agree to a price, and which would amount to about £2,000. The Council would have to borrow the money to buy the company out; the preparation and presentation of the case would cost about £500. It was decided to prepare the case for an application to be made to the L.G.B. for sanction to borrow the necessary money.—*East Anglian Times*.

Gloucester.—PROPOSED LOAN.—Subject to approval, the T.C. has decided to apply to the L.G.B. for a loan of £350 for cable extensions to a local works.

Hornsey.—PRICE INCREASE.—The Council has decided that, as from the readings of the meters at the end of the Christmas (1917) quarter, the prices to be charged for electricity for lighting and power shall be increased by the addition of an amount equal to 40 per cent. of the prices charged on August, 1914; and that from January 1st next the increase of 25 per cent. on the meter rents be withdrawn.

Kirkcaldy.—PRICE INCREASE.—The Electric Lighting and Tramway Committee has decided to increase the charges for lighting and power by 25 per cent., being a total increase of 50 per cent. on pre-war prices.

Leeds.—WAR BONUS.—The General Purposes Committee has agreed to advance the war bonus of Corporation employés from 9s. to 15s. per week for men and to 12s. for women, those affected being persons in receipt of not more than £250 per year, and excluding certain members of Trade Unions with whom other negotiations have been completed.

Littleborough.—The suggested alteration of the supply of current to the Littleborough section of the Rochdale Corporation tramways has been approved by the Controller of Electric Power Supply, but he has now intimated that he cannot grant facilities for obtaining cable at the present time. The chairman and engineer are engaged in trying to secure second-hand cable for the purpose.

Liverpool.—LOAN SANCTION.—The City Council has received the consent of the L.G.B. to the borrowing of £52,000 for mains in the Aintree and North End districts.

London.—ISLINGTON.—The Electricity Committee recommends that, commencing with the March quarter accounts, the charges for electricity be increased as follows:—50 per cent. increase above pre-war prices for all energy supplied at 1d. and under per unit; 33½ per cent. increase above pre-war prices for all energy supplied to private consumers at any charge above 1d. per unit; charges for public lighting to be increased from 1'54d. to 1'3d. per unit.

The City of London E.L. Co. announces a further 10 per cent. increase in electricity charges, from March, 1918, making a total of 30 per cent. for power and 20 per cent. for lighting and heating on pre-war rates.

STEPNEY.—YEAR'S WORKING.—The accounts of the Corporation electricity undertaking for the year ended March 31st last show a total income of £131,867, being an increase of £30,336 over the previous year. The total expenditure amounted to £94,710, an increase on 1916 of £25,421; this left a surplus of £40,156 to be carried to net revenue account, as compared with £35,242 in 1916, and after providing for interest, sinking fund and other charges, there was a deficit of £3,581, as compared with a deficit of £5,864 in the previous year. There has been an increase in the number of units sold from 21,971,891 to 27,011,530, the output being as follows:—Private lighting, 4,319,893 units; power and heating, 10,873,362 units; in bulk for lighting, power and heating, 5,316,376 units; public bulk supply, 6,292,676 units; public lighting, 179,223 units; the total average cost per unit sold was 1'232d., as against 1'055d. in the previous year.

The engineer, Mr. W. C. P. Tapper, in his report states that coal cost 3s. 8d. per ton more than in 1915-16, which, on the year's consumption of 53,630 tons, represented an increased expenditure on this item alone of £9,382; he also points out that the coal bill is enhanced by between 3s. and 4s. per ton due to the fact that all the coal is now rail borne, as a result of the stoppage of supplies by sea, thus entailing extra cost in taking to the Poplar Dock and barging to Limehouse; this represents from £8,000 to £10,000 per annum.

As regards the deficit, which has been transferred to the reserve fund, unless the existing 50 per cent. advance in charges proves sufficient to avoid any further drain on the fund, a complete revision of the Council's tariff will be essential.

L.C.C.—The Finance Committee recommends the sanction of the Council to the borrowing of £38,555 by the Battersea B.C. for a 5,000-kw. turbo-generator and 1,500-kw. rotary converter.

Loughborough.—PRICE INCREASE.—The T.C. has decided to increase the cost of electricity for power by 10 per cent. Alderman Bumps, moving the resolution, said the increase was necessitated by the extra cost of coal and wages; the revenue account showed that the output of current had increased by over 80 per cent.; the income had increased for the half-year from £3,141 to £5,645, but the charges had also increased by £1,880. The profit had increased from £527 to £1,142; repairs had cost £633. He considered they might look forward to a satisfactory financial return at the end of the year.—*Nottingham Guardian*.

Lurgan.—The Council has referred to a Committee the question of providing electric light at the waterworks, Castor Bay.

Manchester.—PRICE INCREASE.—The City Council has approved the Electricity Committee's proposal that an advance of 20 per cent. be made on the charges for electricity for lighting, industrial power, and domestic power as from the December quarter, 1917. The total war additions are now:—Lighting, 30 per cent.; industrial power, 35 per cent.; and domestic power, 30 per cent.

Monaghan.—WORKHOUSE LIGHTING.—On the B. of G. discussing the lighting of the workhouse, a member remarked that but for the high prices of material they would have had the electric light long ago.

Menston.—E.L. PROPOSALS.—A meeting of the rate-payers is to be called to discuss the terms on which the Electrical Distribution of Yorkshire, Ltd., is prepared to supply electricity to the village.

Nelson.—STREET LIGHTING.—Owing to present conditions, the Electricity and Tramways Committee has declined to consider the question of street lighting by electricity from the tramway standards.

Newcastle-under-Lyme.—BULK SUPPLY.—The Council has decided to submit particulars of the scheme (as submitted by the electrical engineer) for taking a bulk supply of electricity from the Stoke-on-Trent Corporation, to the Ministry of Munitions, the B. of T., and the L.G.B., for their approval, after the same has been submitted and approved by the Stoke-on-Trent Council.

The engineer's proposal for bulk supply was to install a 150-kw. rotary or motor-converter, costing roughly £1,200; mains, 1,325 yards, £1,200; E.H.T. and L.T. switchgear, £400; contingencies, £200; making a total of £3,000. He pointed out that the saving in cost of generation would be more than sufficient to pay interest and sinking fund on the capital expended, as the present fuel cost was nearly 3d. per unit; also that additional plant would be required shortly to deal with the load in the recently extended borough area.

Oldham.—PRICE INCREASE.—The Corporation has decided that, as from December 25th, and until further notice, the prices of electrical energy will be increased as follows:—(a) All lighting rates (with the exception of the flat rate), increase of 15 per cent.; (b) all power, heating, and cooking rates (with the exception of cotton mills under agreement), increase of 15 per cent.

Rochdale.—The Corporation has declined an application from the Todmorden Corporation for a bulk supply of electricity, owing to no surplus plant being available.

Rotherham.—SUPPLY DEVELOPMENTS.—The Electricity and Tramways Committee has approved of a report of a joint conference of representatives of Sheffield and Rotherham Corporations that it is desirable that a Committee should be formed, consisting of representatives of the Sheffield and Rotherham Corporations and other authorities interested, and large consumers of electric current, to consider as to the propriety and possibility of the best and most economical production and distribution of electric current in the Sheffield, Rotherham, and surrounding district, and that at the earliest practicable stage in the proceedings the Yorkshire Electric Power Co. and the South Yorkshire colliery proprietors should be brought into consultation.

Sheffield.—Representatives of the Corporation have been appointed on a Joint Committee to consider the question of electricity supply in Sheffield, Rotherham, and adjacent districts. It has been decided to accept an offer received from the North Metropolitan Electric Power Supply Co. to purchase the power factor rectifier now installed at the Sheaf Street station.

South Africa.—A scheme for the electric lighting of Untali, Rhodesia, has been prepared, and in view of a large flow of water existing in the locality, it is thought that power also will be generated.—*British South Africa Gazette*.

Southampton.—PRICE INCREASE.—The T.C. has further increased the charge for energy for lighting, power, and heating by 20 per cent. as from the meter readings for the December quarter, making a total advance on the pre-war rates of 10 per cent.

Stafford.—PRICE INCREASE.—The T.C. has agreed to a recommendation that the price of electricity should be increased by 3d. per unit for lighting and power, with the same discounts as at present, except that the consumers for power not exceeding 200 units per quarter be returned a discount of 5 per cent. instead of 2½ per cent., and that such increase should take effect from the last reading of the meters during the current quarter.

Wallasey.—BULK SUPPLY.—The T.C. has undertaken to supply electrical energy in bulk to the Hoylake and West Kirby District Council under the B. of T. scheme.

Walsall.—SALE OF PLANT.—In connection with the disposal of old plant, the Council has sold two 500-kw. generators for £6,000; two D.C. generator sets, a condensing plant, and a boiler with stoker for £900; and two economisers and a pump for £598. It is estimated that on the present year's output, the saving in working costs at Birchills compared with the old working costs will be approximately £10,000. A 200-kw. transformer is to be purchased at an estimated cost of £250, and a motor vehicle for the department, at a cost not exceeding £200. The South Staffordshire Tramways (Lessee) Co., Ltd., has agreed to pay an increased charge of 40 per cent. for a temporary additional supply of current given to it, and also to pay a similar advance for the present supply.

Warrington.—PRICE INCREASE.—The Corporation has confirmed the proposal to increase the price of electrical energy for all purposes by 10 per cent. from January 1st next.

Watford.—LOAN APPLICATION, &c.—The U.D.C. has applied to the L.G.B. for a loan of £780 for E.L. purposes. The charge for energy for lighting has been advanced by 3d. per unit, that for power from 10 to 20 per cent., and the existing prepayment meter rental of 1d. per week raised to 2d., from the end of the December quarter. No extra charge is to be made for public lighting.

Wolverhampton.—PROPOSED LOAN.—Application is to be made to the L.G.B. for sanction to a loan of £1,800, being the difference between the estimated cost of additional converter plant and the estimated amount to be received on account of the sale of the last two of the old reciprocating sets. The engineer has also been authorised to purchase not more than three additional canal boats for the conveyance of coal.

TRAMWAY AND RAILWAY NOTES.

Bradford.—A record of accidents to Corporation work-people during the past year shows 276 of all kinds, of which 15 have proved fatal. The department which heads the list is, not unnaturally the tramways, which has experienced a hundred mishaps. The gas department comes next. The total number for the year is above the average.

Continental.—SWITZERLAND.—According to the financial Press, the figures of the Swiss Budget for the year 1918 have now been published, and it has been agreed to push forward the electrification schemes of the Gothard Railway, for which a credit of 12 million francs is sanctioned. The power stations at Ritom and Amsteg are in course of erection, and work on the section Erstfeld-Bellinzona is in progress.

Glasgow.—ACCIDENT.—Last week a double-deck car overturned, after leaving the track at a sharp corner. The car was crowded, and two persons were killed and 30 injured, one of whom has since succumbed to his injuries.

Kirkcaldy.—It is proposed to link up Kirkcaldy, Kinghorn, Burntisland, and Rosyth by tramway.

Lancashire.—CHRISTMAS DAY SERVICES.—No agreement has yet been arrived at in regard to the tramway service in Manchester and Salford on Christmas Day, though further meetings are to be held this week. The Manchester cars carried half a million passengers last Christmas Day. The Wigan T.C. has decided to suspend its service, in view of the excessive hours worked by employes since the outbreak of war.

Lancashire and Cheshire Wages.—It is stated that an application for still another war bonus will shortly be made by all sections of tramway workers throughout Lancashire and Cheshire. The amount asked for will be 10s. a week, in addition to what is being already paid.

Leeds.—PARCELS DELIVERY.—The Tramways Committee, in response to a request from the Government officials who have charge of the scheme for the co-ordination of road transport that more use should be made of the tramways for the conveyance

of parcels, has appointed a small Sub-Committee to investigate the matter and report to the Committee. At present the tramways do not specially cater for the carriage of parcels, the reasons being that the passenger traffic has been sufficiently lucrative and the desire not to compete with the local carriers. The modified system in operation provides for the carriage of parcels up to half a hundredweight from the city to any part of the system. There is, however, no collection of parcels for delivery in the city except on the condition that such parcels will be called for at the central tramway offices. The main difficulties in the way of an extension of the system are the labour shortage and the problem of distribution, collection, loading, and delivery, constituting a much greater problem than the actual carriage of the goods. The railway companies operating in the city have restricted their areas of delivery during the war.

Manchester.—**REVISED FARES.**—The revised scale of fares on the Corporation tramways comes into operation on December 16th. On some routes there is no alteration, but generally about 640 yards have been taken off the 1d. stages on the main routes. As the average length of the 1d. stage on the principal routes will be 2 miles 757 yards, the Manchester service will still be amongst the cheapest in the country. At the City Council meeting an amendment to refer the matter back was lost, it being pointed out that increased fares were inevitable if the department was to meet the added cost of working.

Rochdale.—The lighting of the tramway routes by lamps from the tramway standards has led to application for similar privileges from the Whitworth, Littleborough, Milnrow and Norden District Councils. The Tramways Committee has granted the concession, subject to proper safeguards, and at the payment of 21d. per 100-watt lamp per hour, the work of erection and maintenance to be done at the District Council's expense. The Electricity Committee charges the tramway department 21d. per unit for these special lighting supplies—double the ordinary tramway traction price.

Stoke-on-Trent.—The local branch of the Amalgamated Association of Tramway and Vehicle Workers has asked for a standard rate of wages for all grades of labour, a maximum week of 48 hours, with overtime at time-and-a-half, and a fortnight's holiday, with pay, after 12 months' service.

Wigan.—At the T.C. meeting recently, it was stated that it had been found that the L.C.C. cars which had been offered to augment the local services were unsuitable. A deputation had interviewed the authorities, and Mr. McElroy, on behalf of the latter, had visited Wigan, and obtained information as to the local position, and the matter of additional rolling stock was now in the hands of the Tramway Control Committee.

TELEGRAPH AND TELEPHONE NOTES.

Batley.—Six Heckwoldwike youths were summoned at Batley, last week, for throwing stones at telegraph insulators. Ten insulators were broken. The eldest, a lad of 21, was fined £1, and 3s. costs, and the others had to pay 13s. each.

China.—An agreement has been drawn up and is awaiting the Chinese President's approval between a Chinese and a syndicate described as Danish, by which China grants wireless telegraph rights. The *North Mail's* Peking correspondent fears that the German Telefunken Co. is interested financially and politically.—*Daily Mail*.

Dutch Indies.—The Dutch Government has asked for a credit of five million florins for the erection of a wireless station for communication between Holland and the Dutch Indies. The work will be executed by the Telefunken Co., of Berlin. The receiving installation will be ready in three months, and the sending installation in 18 months.

Long-Distance Telephony.—San Francisco papers announce the invention of a new device for the clear transmission of the voice over practically unlimited distances on surface wires or submarine cables by Dr. S. N. Barnuch of that city. Experiments have been carried out over wires and cables of lengths varying from 30 to 100 miles and over experimental artificial lines up to distances equal to 3,000 miles, and have given such positive results that engineers of the Government and of two large public utility corporations have interested themselves in the invention. According to Dr. Barnuch, his system makes repeaters unnecessary.—*Telephone Engineer*.

United States.—Terms have been settled between the United States Government and the Marconi Wireless Telegraph Co. of America with regard to the remuneration and compensation to be paid to the company in respect of all the company's wireless stations.

CONTRACTS OPEN AND CLOSED.

OPEN.

Argentina.—February 23rd 1918. Rosario Municipality. Establishment of telephone service within the municipal radius. Conditions on application.

Bolton.—January 15th. Electricity Committee. One 7,500-kw. turbo-alternator with condensing plant. See "Official Notices" December 7th.

Brighton.—December 18th. Electrical fittings for the B. of G.: Mr. Horace Burfield, Clerk, Prince's Street.

Spain.—The municipal authorities of Pruna (Province of Seville) have lately invited tenders for the concession for the electric lighting of the town.

CLOSED.

Bolton.—Electricity Committee. Accepted tender: Messrs. G. & J. Weir, Ltd., for a steam turbine feed pump for the Baek-o'-th'-Bank generating station.

Glasgow.—The Tramways Committee has recommended acceptance of the following offers:—

250 steel tires.—H. Bessemer & Co., Ltd.
500 Brown Bayley's Steel Works Ltd.
Oils.—Blacklock & Macarthur, Ltd.; Marks & Johnson, Ltd.; J. & D. Hamilton, Ltd.; J. Murray & Son, Ltd.
Chilled Iron Brake Blocks.—Carron Co.

Lancaster.—T.C. Two motor-bus car bodies. Mr. Jas. Hardy, Lancaster. £245 each.

Sheffield.—City Council.—Accepted tenders for the Electricity Department:—

J. W. Harrison, Ltd.—Cast-iron pipes.
A. Reyrolle & Co., Ltd.—Further 30 panels of extra H.T. sub-station switch gear.
Foster Bros., Ltd.—Pipework.
Edward Bennis & Co., Ltd.—Suction ash plant.
R. White & Sons.—Lifts and rails.

Swansea.—Corporation. Six tenders were opened for the supply of the 5,000-kw. turbine plant necessary for extensions in the borough, and that of the British-Thomson Houston Co., Ltd., was accepted at £25,516. Cables and other accessories will have to be obtained, and application is to be made to the L.G.B. for sanction to raise a loan of £42,000 for the purpose.

Wolverhampton.—Corporation Electricity Committee. Accepted tenders:—

British Thomson-Houston Co., Ltd.—Spare parts for telfer plant, £133.
Stirling Boiler Co.—Duplicate stoker, driving shaft and reduction gear, £94.
G. & J. Weir, Ltd.—Two turbine-driven boiler feed pumps, £480 each; spare parts for present pumping set, £46; two special Hydrokineter nozzle heaters, £44; two non-return valves for Weir pumps, £36.
Reyrolle & Co., Ltd.—Spare oil switch, £82.

FORTHCOMING EVENTS.

Institution of Mechanical Engineers.—Friday, December 14th. At 6 p.m. At the Institution of Civil Engineers, Great George Street, S.W. Paper on "The Use of Soap Films in Solving Torsion Problems," by Mr. A. A. Griffith and Mr. G. I. Taylor.

Electro-Harmonic Society.—Friday, December 14th. At 8 p.m. At the Holborn Restaurant (Venetian Chamber). Smoking Concert.

Greenock Electrical Society.—Saturday, December 15th. Visit to Glasgow Central Station.

Thursday, December 20th. At 7.45 p.m. At 22, West Stewart Street Discussion on "Fuses and Circuit Breakers," opened by Messrs. McDougall and Toppin.

Association of Mining Electrical Engineers (West of Scotland Branch).—Saturday, December 15th. At 3 p.m. Visit to Messrs. Mavor and Coulson's Works, Glasgow. Concert at Trades House Restaurant, 89, Glassford Street.

Society of Engineers.—Monday, December 17th. At 5 p.m. At the rooms of the Geological Society, Burlington House, Piccadilly, W. Lecture by Mr. Chalmers Kearney on "High-speed Railways after the War."

Junior Institution of Engineers.—Friday, December 14th. At 8 p.m. At 33, Victoria Street, S.W. Paper on "Rotary Engine and Rotary Pump," by Dr. W. E. Lilly.

Saturday, December 15th. At 2.15 p.m. Visit to the Britannia Pencil Works, Newcastle.

Monday, December 17th. At 7.30 p.m. At 33, Victoria Street, S.W. Paper on "Engineering in the Brewing Industry," by Mr. C. R. Turner. Adjourned annual meeting.

Royal Society of Arts.—Monday, December 17th. At 4.30 p.m. At John Street, Adelphi, W.C. Cantor Lecture on "Progress in the Metallurgy of Copper" (Lecture III), by Prof. H. C. H. Carpenter.

Wednesday, December 19th. At 4.30 p.m. Paper on "The Cold Storage Industry," by Prof. J. Wemyss Anderson.

Illuminating Engineering Society.—Tuesday, December 18th. At 5 p.m. At the Royal Society of Arts, 18, John Street, Adelphi, W.C. Presidential address by Mr. A. P. Trotter.

Institution of Civil Engineers.—Tuesday, December 18th. At 5.30 p.m. At Great George Street, S.W. Paper on "The Buenos Aires Western Railway Tunnels under the City of Buenos Aires," by Mr. W. L. L. Brown.

Institution of Electrical Engineers.—(Newcastle Local Section).—Thursday, December 19th. At 7 p.m. At the Mining Institute. Presidential address.

(Yorkshire Local Section).—Tuesday, December 18th. At 7 p.m. At the Philosophical Hall, Leeds. Paper on "Electrical Cooking as Applied to Large Kitchens," by Mr. W. A. Gillott.

Liverpool Engineering Society.—Wednesday, December 19th. At 8 p.m. At the Royal Institution, Colquitt Street. Paper on "The Need for Research Work on the Propulsion of Full-sized Ships," by Mr. A. T. Wall.

Belfast Association of Engineers.—Thursday, December 20th. At 7.45 p.m. At the Municipal Technical Institute. Paper on "Electro-metallurgy," by Mr. G. L. Roslyn.

NOTES.

£300 Wanted at Once.—An effort is being made to bring up the invested funds of the Electrical Trades' Benevolent Institution to £10,000 before the close of the year. The following is a copy of a letter issued by the Secretary (Mr. F. B. O. Hawes) to certain members of the industry. As will be observed, £300 is the sum required, and we earnestly hope that it will be forthcoming. The trade has not been worried by this Institution very much of late, owing to the war; but its needs will be pressing when hostilities come to an end, and we appeal for a Christmas response, so that the five-figure total may be reached. The address of the Secretary is as given below, and he will gladly receive any help that readers have it in their heart and in their power to render. Thoroughly believing in this excellent organisation, we strongly recommend it to the sympathy of all. We shall be pleased to pass on to Mr. Hawes any donations or promises that may be sent to us here by letter, by phone, or by telegraph:—

"Dear Sir,—At the last annual general meeting of this Institution Mr. Campbell Swinton contributed a gift of £100 in the hope that by a few others following his example, the funds might this year reach a figure exceeding £10,000. With this object also Sir David Salomons has increased his liberal regular contribution by a further gift of £20.

"The present invested funds are far too small to meet the calls for pensions and temporary assistance which will doubtless be made soon after the War.

"My Committee are very anxious that the £300 required should be obtained before the end of the year. May I ask for your assistance?—Yours faithfully,

"F. B. O. HAWES, Secretary.

"18-21, Park Mansions, Vauxhall Park,

"South Lambeth Road, London S.W.

"December 12th, 1917."

Mischievous Sport.—At the Wakefield local Court, last week, three youths were fined £1. and 5s. costs, for throwing stones at an electric arc lamp. The police said that during the past six weeks £9 4s. 11d. worth of damage had been done to electric lamps in a certain neighbourhood, in addition to damage to gas lamps.

Volunteer Notes.—COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).—Headquarters, Balderton Street, Oxford Street, W. 1.

Orders for the week, by Lieut.-Colonel C.B. Clay, V.D., commanding:—

Office for the Week.—Second Lieut. F. Gaywood.

Drills.—Week ending Friday, December 21st, 1917:—

Monday.—No. 3 Company, Left Half. Recruits, signalling, 6.30.

Tuesday.—Physical drill and bayonet training, 7.30.

Wednesday.—No. 1 Company, 6.30.

Thursday.—No. 2 Company, 6; signalling, ambulance, 6.30.

Friday.—No. 3 Company, Right Half. Recruits, 6.30.

Masketry.—Belvedere Road, Tuesday, Wednesday, and Thursday, 5.30 to 7.

Note.—Christmas Holidays: Headquarters and the Range will be closed from the 22nd to the 28th, both inclusive.

The Medical Officer will attend for examination of recruits, &c., on Thursday, at 6.30.

Unless otherwise indicated, all drills will take place at Headquarters.

(By order) MACLEOD YEARSLEY, Capt. and Adjutant.

Decimal Coinage.—In an excellent little pamphlet just issued by the Decimal Association, after recording the consensus of opinion on the part of the Institute of Bankers, the Association of Chambers of Commerce of the United Kingdom, and the Decimal Association in favour of the adoption of the pound sterling as our monetary unit, divided into 1,000 mils, the Association gives the following reasons why the present is an opportune time for making the change:—

1. Relief to the poorer classes would be afforded by the substitution for our present "penny" coinage of the more finely graded "mil" coinage, which would inevitably result in a closer relation between the cost and the price of food and other daily necessities bought in small quantities.

2. Under the new system all prices and charges now expressed in pence would be quoted in mils, and the present period of fluctuating values is obviously a most opportune time for making the small adjustments incidental to this change of practice.

3. Millions of our people are now obtaining practical first-hand experience in the use of coinage arranged on a decimal basis, this being the basis already adopted by all our Allies.

4. The withdrawal from circulation of the crown, half-crown, and threepenny piece would afford some relief at this time of abnormal shortage of silver.

5. The present close co-operation between the Government and the owners of public and semi-public services gives a favourable opportunity for the speedy adjustment of such tolls, fares, &c., as are now fixed by Statute.

Belfast Arbitration.—At a meeting of the Belfast Tramways and Electricity Committee, last week, a letter was read from the Electrical Trades Union on the subject of the application of an award of Mr. Doughty, K.C., in the matter of an arbitration between the Union and the National Federated Electrical Association, representing the Belfast employers and contractors, and a communication from the Electrical Contractors' Association having been read to the effect that the award had been complied with in so far as their members were concerned, the advance was ordered to be paid, pursuant to the Council's Standing Orders. A further letter was read from the Electrical Trades Union on the subject of the application of the 12½ per cent. bonus award, and the consideration thereof was held over for further information. A

letter was also read from the district secretary of the Amalgamated Society of Engineers, transmitting copy of an award of the Committee on Production in relation to their recent application, and the consideration of it was held over pending a further communication being received from the Belfast Employers' Association on the subject. The Committee had under consideration the question of the provision of additional plant at the electricity station, and ordered a communication to be addressed to Sir John Snell on the subject.

Water Heating by Electricity.—On November 2nd, Mr. W. J. Wilson gave a lecture on "Electric Water Heating," before the Junior Institution of Engineers. He pointed out the obvious advantages of using electricity for heating and cooking in respect of cleanliness and reduction of work. The heating of water on a large scale, say, for baths, has, however, some drawbacks, and there are some problems to be solved before the best results can be obtained. One of the main drawbacks—not inherent in the apparatus itself—is the price of electricity. At lighting rates water heating in bulk is not a commercial proposition.

Electric heating systems may be classified as follows: (1) Thermal storage; (2) geyser; (3) separate hot water tanks; (4) circulating systems with storage tanks. In these the design is influenced by the desirability of running the apparatus constantly in order that advantage may be taken of the cheaper electricity rates which are available for sustained and steady loads.

The Therol heater (Class 1) is designed to run 24 hours per day, i.e., it has a 100 per cent. load factor. A heater taking 200 watts delivers 20 to 30 gallons of water at 110° F. per day, or 9 gallons at boiling point.

The Losles heater (Class 1) is controlled by a thermostat, so as to maintain the water at any desired temperature from boiling point downwards. The 10-gallon size can give 20 gallons per day at 200° F., and is rated at 500 watts.

The Ferranti heater (Class 1) is generally arranged to take 350 watts, and is capable of raising 38 gallons through 60° F. in 24 hours. By means of an arrangement of slow circulation of water it is possible to obtain boiling water from this heater in one hour.

The first class of heater is useful only where the demand for water is more or less continuous, but not for such work as baths, for example. It cannot deal with this type of service unless excessive storage is provided, with its inevitable high heat losses. It has no emergency valve, and a very small leak may seriously affect its efficiency.

The electric geyser (Class 2) is the quickest heater, but its loading has to be heavy, and switchgear becomes a serious item. For example, with water flowing at a rate of 5 gallons per minute, 40 kW. would be required to raise the temperature through 54° F. For ordinary lavatory use a geyser to supply hot water requires from 5 to 8 kW.

For a succession of baths it is best to provide a separate hot-water tank (Class 3). A standard pattern in use contains 15 gallons, and is provided with an immersion heater taking about 10 kW. In this the 15 gallons can be raised through 90° F. in 20 minutes, and, allowing 20 minutes per bath, the bath can be kept in constant commission. The consumption of energy for three baths is thus 10 units.

A thermostatic control can be fitted to this type of heater, and this, assisted by a clock-switch and electric bell, can work wonders in a lazy bachelor's flat.

The fourth class of heater is inefficient, although giving no trouble in working. Large heat losses are inevitable in any circulating water system. With bare pipes and water at 130° F. the loss may be, say, 34 watts per sq. ft. In 24 hours 250 ft. of 1 in. pipe would lose 72 units. Efficient lagging may reduce this loss by 60 per cent. or 70 per cent.

Electric apparatus being so clean, convenient and reliable, quite a profitable load of respectable dimensions may be obtained by a supply station, provided that energy is supplied at a reasonable price.

Birmingham Corporation Electrical Employees.—The Birmingham Corporation Electricity Committee and representatives of the Electrical Trades Union are holding a meeting to consider demands made by the Union on behalf of the electrical workers that they shall participate in the awards applicable to the Union and not in the usual municipal advances. It is stated that the demand was lodged in November by the Birmingham district secretary of the E.T.U. on behalf of youths and men who were formerly members of the Gas, Municipal, and General Workers' Society and have been admitted to the E.T.U. The secretary (Mr. Beardmore) also applied for 25 per cent. proportionate extra salary for all periods of night shift work, for shift engineers, for switchboard attendants, and for assistant switchboard attendants employed at the generating stations; and for time and a quarter for night shift for attendants and assistants at sub-stations.

"This is equivalent to a demand for the recognition of all these men as engineers, and if conceded would have entitled them to participate in all the awards made to skilled workers by the Committee on Production instead of waiting for concessions made to the general body of municipal workers.

"On December 3rd, however, a letter was received by Mr. Beardmore from the Department, declining to recognise the claims of these men apart from the general labourers of the Corporation, and when this letter was presented to a meeting of the Birmingham Station Engineers' Branch of the Union, of which all the men affected are members, it was decided to instruct the general secretary to adopt all possible methods to secure their demand.

"Mr. Beardmore, thereupon, forwarded notice of the intention of the men to cease work if their demands are not conceded by the 14th inst."—*Birmingham Gazette*.

Legal.—ELECTRICAL INSTALLATIONS, LTD., v. EDE AND TOWNSEND, LTD.—In the Lord Mayor's Court, on December 10th, before Assistant Judge Jackson, sitting without a jury, this case was heard and disposed of. The plaintiffs, electrical engineers of Martin's Lane, E.C., sued the defendants, printers, of Tabernacle Street, for £25, balance of account for work done and material supplied in connection with an electrical installation at the defendants' premises. The defendants early in the present year were moving from premises in Southwark Bridge Road to Tabernacle Street, and the plaintiffs were asked to adapt an electric installation at the latter premises, to bring it up to date, and make it suitable for their (defendants') requirements. This the plaintiffs did, at a cost of £55. The defendants had paid £30 on account, leaving the balance sued for due. The defendants counter-claimed for a sum of £1, alleging that that sum was paid to the plaintiffs for work done, which they had not carried out. Walter James Hayward, assistant engineer to the plaintiffs, said he supervised the work carried out by his firm on the defendants' premises. He had discussed the matter of adapting the installation on the premises as much as possible, with Mr. Tomlin, of the defendant firm, and had pointed out that it would be preferable to put into the premises an entirely new installation. An experienced mechanic was put on the job, which took about ten weeks to complete. Edward William Clifton, electrical fitter, who carried out the work for the plaintiffs, said that during the time he did the work there was no complaint that he was wasting time. He found that the installation he had to work upon was done by amateurs from time to time, and a great many of them. He had never seen such wiring before, and the whole of the lighting was on one circuit. He had made four new circuits, and bunched what remained on three other circuits. The job was made up to date as far as it was possible. Alfred Tucker, manager of the plaintiffs' maintenance jobbing department, said £8 6s. was the net cost of materials used by them on the defendants' work and £30 2s. 3d. paid for labour; 33½ per cent. was added to cover establishment charges. The charge for labour seemed a little out, but upon inquiry he found there had been a good deal of "testing labour," which would not have been required in putting up an entirely new installation. When the account was sent in to the defendants they complained that it was exceedingly vague, and that the only thing definite was that it was for £55 0s. 6d. They asked for details, which were given. For the defence, Mr. William Ede, managing director of the defendant company, said that the plaintiffs held an electrical maintenance contract from them while in their old premises in Southwark Bridge Road. When moving to Tabernacle Street they desired the existing electric installation in the portion of the premises they were occupying to be adapted to their use. He saw a representative from the plaintiffs, who he thought was a traveller, and got an idea as to the cost of the work. When the plaintiffs' account came in, however, he thought the charges made by them were excessive, and payment was refused. Mr. Kirk, electrical engineer, and Mr. George Edward Vigor, partner in the firm of G. H. Boyd, builders and decorators, were called to speak as to the overcharges in the plaintiffs' account. The Assistant Judge, after hearing the evidence, gave judgment for the plaintiffs on their claim for £20 6s. 9d., and on the counter-claim, with costs.

L.C.C. and Vehicle Charging.—The General Purposes Committee has had under consideration a communication from the Commissioner of Police with regard to street fittings for supplying fuel, energy, &c., to motor vehicles, and has referred the matter to a number of other Committees, which have reported against the proposals. As this matter is of great future importance to electric vehicle users, the objections which we reprint below will be studied with interest, and no doubt assessed at their true worth:—

1. Motor vehicles waiting at supply points along tramway routes would compel slow-moving traffic to move on to the tramway tracks, thus causing obstruction to fast traffic and greatly increasing risk of accident.

2. The standing of motor vehicles, especially in the case of large vans, pantechnicons, &c., would obscure the view of pedestrians crossing the road, and would be a fruitful cause of accidents.

3. Any supply points situated near tramway stopping places would obstruct and cause danger to pedestrians entering or leaving the trams.

4. The width of footway in many thoroughfares is already so narrow that pedestrians overflow into the carriageway, and the adoption of the proposed scheme would increase the danger arising on this account.

5. The main thoroughfares of London are of such dimensions that supply depôts would cause obstruction.

Exit Gas Heating.—Dr. Waldo, Coroner for the City and Southwark, advises those who preside over courts of justice, and who suffer from malaise, to have samples taken of the air, and to look to the heating arrangements. Pointing out that the temperature in his two Courts recently could only be raised to 18° and 52° respectively, he remarks, "Such a temperature cannot be endured in comfort by people sitting still. A temperature of 66° is required by people of middle age or above it."

The L.C.C. chemist Mr. Coste, analysed the air at the Southwark Court, and found that the gas radiators loaded the air with ten times the normal amount of carbon dioxide and gave off an irritant gas, as well as aqueous vapour.

Dr. Hartley (St. Bartholomew's) also reported the presence of carbon monoxide, a highly poisonous gas, "which," observed the Coroner, "gives rise to headache, lung irritation, and other symptoms."

The gas radiators have now been replaced by electric stoves.—*Daily Chronicle*.

Books for British Prisoners of War.—We have received from Mr. A. T. Davies, chairman of the "British Prisoners of War Book Scheme (Educational)," Victoria and Albert Museum, South Kensington, S.W. 7, a brochure giving a further account of the working of the scheme, the purpose of which is to provide "interesting and purposeful occupation to men for whom such occupation is a matter of vital necessity," to prevent their demoralisation by the *ennui* of prison life. Books have been sent to over 200 prison camps; books have been provided in 44 languages, and dealing with some 115 subjects. In the nine months from January to September, 1917, 6,500 requests for books were received from prisoners, and 7,500 parcels of books were dispatched, including some 43,700 educational books. The present rate of expenditure is £250 per month, of which $\frac{2}{3}$ is represented by purchases of books, and a standing stock of at least 12,000 volumes has to be kept at South Kensington. Numerous letters testifying to the immense benefit derived by our captive brothers from these books are extracted in the brochure, and it is stated that £5,000 is needed at once—there are 500 camps not yet covered. Donations are earnestly requested; if these take the form of books, a list, giving dates or editions, should first be sent. Great assistance can also be rendered by local effort, and those who wish to send books to friends in prison can use the scheme for the purpose. The following are a few of the subjects on which books are asked for:—Management of Dynamos; Switchboards; Practice of Electric Wiring (Munro); Switches and Switchgear; Electricity (Hobart); Practical Wiring (Metcalfe); Electricity (Kapp); Electric Lifts and Cranes; Dynamos; Alternating Current; Electric Tramcar Driving; Electric Motors; Electric Fittings; Small Dynamos and Motors.

Electric-Light Switching.—SIXTH BATCH EXAM.—As the advanced-grade results had to be got out first, and as much work remains to be done in completing the examination of the numerous intermediate and preliminary papers, the previous publication of the advanced-grade passes has been thought advisable, especially as many of the examinees have been waiting for some time. These results are given below. The complete results will be published during January or February.

ADVANCED GRADE.—The names are given in order of merit. Six book prizes and certificates:—

H. C. WILKINSON, Wh.Sc., Stud.I.E.E. (Portsmouth).
F. H. Goudenough, Lance-Corporal R.E. (Isle of Wight).
 T. R. Priest (Birmingham).
 C. L. Drury (Derby).
N. A. Jassawalla, L.M.E., Bombay (Karachi, India).
 J. W. Platt (Manchester).
 H. C. Whitfield (Burslem).
 T. H. Ingle-Scott, I.E. Telegraphs (Karachi, India).

The names in italics above and below denote the gaining of an advanced certificate for the second time, this fact debarring the examinee from taking a prize.

Certificates.—*H. Grimshaw* (Goldborne, Lanes.), *T. C. Hodges* (London, W.), A. V. Cattrell (Barrow-in-Furness), D. Cairns (H.M.S. *Royal Oak*), T. J. Trewitt (South Shields), T. C. Long (Bristol), R. F. Galea (Malta), S. E. Reason (London, E.), T. Wheatley (West Lothian, Scotland), W. C. Larkman-Taylor (Croydon), W. Maddock (Warrington), M. Yusif (Upper Sudan, Egypt), W. H. Gregory (Melbourne), F. Townsend (Cape Town). Twelve competitors failed.

A new advanced-grade paper is just being published, and may be had on request from Messrs. A. P. Lundberg & Sons, 477–499, Liverpool Road, London, N. 7.

Institution and Lecture Notes.—Royal Institution.—The following are amongst the lecture arrangements before Easter:—Prof. J. A. Fleming, a course of six experimentally illustrated lectures, adapted to a juvenile auditory, on "Our Useful Servants: Magnetism and Electricity," commencing December 27th. Sir R. T. Glazebrook, two lectures, on "The National Physical Laboratory." Prof. Sir J. J. Thomson, six lectures, on "Problems in Atomic Structure." The Friday meetings will commence on January 18th, when Prof. Sir James Dewar will deliver a discourse on "Studies on Liquid Films."

Institution of Electrical Engineers.—At the meeting of the NEWCASTLE LOCAL SECTION, to be held on Tuesday next, there will be a reception by the president of the Institution, Mr. C. H. Worthingham, with the chairman of the Local Section, Mr. A. H. Marshall, followed by an address by the president. A good attendance is specially hoped for.

The Award of the Committee on Production.—Mr. H. Faraday Proctor, hon. secretary of the I.M.E.A., has forwarded to the engineer members of the Association copies of correspondence which has passed between him and the Committee on Production with regard to the date from which the award of 5s. per week is to be paid. The Committee states that the advances granted under the award of November 6th for the engineering and foundry trades are first payable on the pay-day for the first complete pay-week in December. If, for instance, the pay-week commences on a Thursday, then the first complete pay-week in December commences on the 6th, and the advances are payable for the week ending December 12th.

Fatality.—At an inquest into the death of G. McIntosh, 72, which followed injuries received in the electrical power station, Laganbank Road, Belfast, the jury returned as their verdict that deceased died from fracture of the cervical column caused by the accidental falling of a boiler plate; the accident was caused by a defective bolt, the property of the Corporation.

New Methods of Electrical Treatment.—The medical correspondent of the *Daily Mail* states that "the best equipped electrical workshop in Europe for repairing injured soldiers" was the description an R.A.M.C. colonel recently applied to the Radcliffe Infirmary at Oxford.

An electrical apparatus which totally numbs the severest nerve pains, while, at the same time, gradually bringing about a permanent cure, a machine which will cure acute "water on the knee" in one 20-minute "exposure," and another which charges the patient up like a storage battery, are a few of the wonders shown to the correspondent.

A young soldier suffering from ceaseless pain in one hand, caused by an obscure injury to a nerve, was treated by an ordinary-looking electric battery from which two wires led, one being held in the injured hand and the other attached to a metal plate at the back of the neck. The current stops the pain in the hand, the periods of freedom increasing after each treatment.

For the removal of wasting growths a patient is connected with a special type of battery. When he is "fully charged" the operator brings a needle-pointed metal instrument almost into touch with the tissue to be removed. A flame of electricity jumps from the patient to the instrument, and the growth is instantaneously destroyed. Through the free passage afforded to heat rays, the germ in the growth is literally "cooked" by the electric discharge being concentrated on so small an area, thus producing a high current density. The effect can be seen during an operation as a grey coagulation or destruction of the tissue.

The problem of how to exercise electricity on paralysed muscles without unduly stimulating the healthy ones has been solved by means of a newly perfected system of condensers, which causes the injured muscles slowly to contract and relax, while the healthy ones remain quiescent.

Rathenau and an Enduring Peace.—In our issue of January 26th, 1917, we quoted an article by Dr. Walther Rathenau, of the A.E.G., on preparations, "in the economic sense," which must be made for "the next war." "When the next war comes it must not be a year too soon." The well-known electrical magnate has just been addressing the annual meeting of the A.E.G. in Berlin, and what he now seems to desire is an "enduring peace." A Renter telegram from Amsterdam, published in the *Times*, quotes the following from his speech:—

"The war has entered the state of liquidation. The climax is past. The British thought that the war could be regarded as only a sum in arithmetic, and that in a given period an entirely isolated country must have exhausted its war supplies and be forced to give up the war, but no material exhaustion is to be feared in Germany. Human and moral factors, resolution, organising will and self-confidence, are stronger factors than mechanical powers. Lord Lansdowne's letter displays the reawakening of a spirit of soberness and moderation. Our foreign affairs are in strong hands, which we trust, and I hope that the political liquidation will be ended so that an enduring peace may be assured."

The Non-Ferrous Metal Industry Bill.—The House of Commons, on Tuesday, resumed the discussion of this Bill. Several speeches were delivered criticising the measure. Its supporters held that it was essential to prevent foreign merchants from getting control of the metal merchants of this country, and that we were only protecting our own interests when we took steps to deprive Germany of the power of control. One speaker said that the discussion raised the question whether or not we meant to retain control over our essential key industries. Mr. Runciman criticised the Bill on various grounds, and wanted it, after second reading, to be referred to a Select Committee. Mr. Bonar Law ultimately replied at length. He said that if we were to attempt to eliminate German influence from the essential industries, we must have safeguards of the kind proposed, and some Government Department must take the matter in hand. The Bill was based on one of the Paris Conference resolutions, which were all drafted by Mr. Runciman. Mr. Bonar Law showed how the Germans had exercised their power. Our enemies must be let to know that we should not hesitate to use our powers to get rid of German penetration in this matter. The main question at the end of the war would be the supply of raw materials. They would be scarce in every industry. The longer the war lasted, the less there would be to go round, and as the Allies would help themselves first, the less there would be for Germany of essential commodities. In order to have independence at home, they must get rid of German control. After further discussion, the amendment moved by Sir F. Banbury rejecting the Bill was lost by a majority of 103 votes. The Bill was then read a second time, and by a majority of 76 was referred to a Committee of the whole House.

Christmas Fire Warning.—The British Fire Prevention Committee has issued a special warning in connection with Christmas entertainments in hospitals, camps, private assemblies, &c. The danger of ignition of dry evergreens, Christmas trees, paper lanterns, cotton wool, celluloid, &c., is pointed out, and the public are warned not to make the slightest change in electric wiring without consulting a competent electrician or an electrical inspector. Buckets of water should always be available, and stout blankets are useful for smothering incipient fires.

Copies of the "Warning" (No. 22a) are obtainable gratuitously from the Committee at 8, Waterloo Place, Pall Mall, London, S.W. 1, upon written application, with the necessary return postage enclosed.

Copper from America.—Professor H. C. H. Carpenter, of the Imperial College of Science, speaking at the Society of Arts, on Monday, said the demand for copper during the war had been enormous. It was impossible to estimate the aid given to the Allies by the copper manufactures of the United States, for so far no substitute for the metal at an equivalent price had been found. It was calculated that last year the United States produced 860,000 tons of copper, compared with 592,600 tons in 1912.—*Morning Post*.

Budapest without Light.—A Renter dispatch from Zurich says that the whole of Budapest has been entirely without gas since last Friday evening, when the supply was suddenly cut off, and the whole city plunged in total darkness, as the electric street lighting was suspended two years ago. The gasworks stoppage was due to the use of inferior Prussian coal, which choked the retorts.

Appointments Vacant.—Charge engineer for the Paisley Corporation Electricity Department; costs and stores clerk for Worcester Corporation Electricity Works; charge engineer (£130 +) for the York Corporation Electricity Department; station superintendent for the Stalybridge Joint Tramways and Electricity Board; commercial secretary (£300) for the Borough of Wolverhampton Electricity Department; junior shift engineer (52s.) for the Borough of Stockport Electricity Department; power superintendent (£200) for the City of Birmingham Gas Department; assistant engineer for the Bootle Corporation Electricity Works. See our advertisement pages to-day.

Steam Turbine Accidents in the United States.—A recent issue of *Power* contains some interesting statistics relating to the more serious accidents which have occurred to turbo-electric plants in the United States, apparently during the past eight years or more.

This is a subject on which both users and manufacturers are naturally disinclined to invite publicity, although much valuable information on the causes of accidents is obtainable from the records of failures and breakdowns of machinery.

Of the accidents cited by our contemporary, 19 were stated to be due to "explosion"; of these, two were definitely attributed to excessive steam pressure; three others to "over-speed"; while a fourth—in which a rotor burst—could be credited to the same cause, and it would be interesting to know what proportion of the remaining unspecified cases of "explosion" were due to over-speed, which figures as the cause of two further accidents not classified as "explosions," though evidently having serious consequences.

Seven cases of blade stripping are mentioned, due to shaft deflection, the presence of foreign substances in the machine, &c., the results being much less serious than in the accidents previously mentioned.

In addition to the above, 11 miscellaneous accidents are recorded, including three of turbine sets destroyed by unspecified causes; two due to pieces of rotor breaking off and jamming; one due to oil failure at a step bearing; another to generator case distortion; another in which the shaft was thrown out of its bearings, and two unspecified accidents.

In a great many cases the turbine or generator, or both, were completely wrecked.

All the cases except one relate to American plants, the exception being at Trieste. The most serious cases of loss specified were at Baltimore, where two large turbines owned by a railway company exploded, causing \$260,000 loss, while a third vertical turbine in the same city, belonging to a light and power company, also exploded (due apparently to the failure of a relief valve), causing \$175,000 loss; at Los Angeles (Cal.), three turbines wrecked by one explosion resulted in an estimated loss of \$250,000.

Although the list is a lengthy one, and not complete, it covers a number of years; it was apparently supplied to our contemporary with a view to refuting a statement by a correspondent that turbine explosions due to over-speed or over-pressure in the lower stages had been few and far between.

The Use of Inland Waterways.—The County Purposes Committee of the Common Council of the City of London has considered the recent letter of the Canal Control Committee, urging manufacturers and traders to increase their use of our inland waterways, and has expressed its cordial approval of the proposal, adding the opinion that it will be to the great advantage of the trading community if the inland waterways are unified and improved with a view to their extended user. The latter object can best be attained by the construction of a central authority, with Parliamentary powers, to take over and develop the existing system of inland waterways on the lines of the Port of London Authority Act, 1908, with such modifications as are considered necessary to meet the circumstances. The Committee further recommends that the Government be urged to give effect to the recommendations of the Royal Commission appointed in 1906 to inquire into and report upon the Canals and Inland Navigations of the United Kingdom.

The A.S.E.—The funds of the Amalgamated Society of Engineers have increased this year to over two million pounds. The membership is 270,000.

A private delegates' meeting of the Society was held on Tuesday, to consider a suggested amendment of the constitution to enable fusion with other Unions desirous of affiliation, thus facilitating joint action in matters of common interest.—*Times*.

Inquiries.—Makers of traction armature coils are asked for.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—The employees of the Leigh Corporation electricity works presented Mr. A. T. SMITH, the borough electrical engineer, with a gold wristlet watch as a token of their regard and esteem, on his appointment to the British Dyes, Ltd., Huddersfield.

Darwen Town Council has decided to release its tramways manager, Mr. F. J. S. HOSKENS, to enable him to accept an appointment as assistant dilution officer under the Ministry of Munitions at Manchester. He will retain his position as manager, giving attention to the department in the evenings, without salary. The arrangement is an experimental one, and is for a period of three months.

Leigh (Lancs.) Electricity Committee, from 141 applicants, has appointed Mr. J. B. HUDSON, deputy electrical engineer of Bootle, as electrical engineer of Leigh, at £300 a year.

Aberdeen Council has advanced the salaries of Mr. R. HUNTER, station engineer, and Mr. A. H. M'KAY, mains superintendent, from £250 to £280 as from November 1st, with a further increase of £20 next year.

The South Shields Electricity Committee recommends advancing the salary of the electrical engineer by £50 per annum.

The salary of Mr. C. W. COOKSON, accountant and collector to the Walsall electric supply department, has been increased from £188 to £214 per annum.

The following increases of salary have been approved by the Establishment Committee of Sheffield City Council in connection with the new power house:—J. R. WILLIAMS, assistant station superintendent, Kelham Island, to be resident constructional engineer at a salary of £275 (including £25 increase); S. NEWTON, shift engineer, Kelham Island, to be assistant station superintendent at a salary of £225 (including £25 increase), rising to £250 in 12 months; E. ATKINSON, shift engineer, Neepsend, to be assistant station superintendent at a salary of £250 (including £50 increase).

The Erith U.D.C. has advanced the salary of Mr. J. C. WILLIAMS, the electrical engineer and tramway manager.

The Birmingham Electric Supply Committee has reduced the number of applications for the position of secretary to the department, in place of Mr. Howard Foulds, to three. A recommendation will shortly be made to the City Council.

The Worcester City Council has approved the following advances, on the recommendation of the Electricity Committee:—Charge engineer, from £141 per annum to £3 per week, and 5s. war bonus; another charge engineer from £133 18s. to £2 15s. per week, and 5s. war bonus; chief assistant and mains superintendent, from £225 to £250 per annum; station superintendent, from £205 to £230 per annum.

The Burton-on-Trent Electricity Committee has decided that the remuneration of the charge engineers be increased from £150 6s. to £165 per annum, and that of Mr. C. J. McILBOURNE be increased from £217 to £240 per annum.

Mr. W. S. VIGNOLES, Grimsby borough electrical engineer, has been gazetted Lieutenant-Colonel. Mr. Vignoles, who was attached to the local Volunteers, offered his services at the outbreak of war, and went out to France in 1916.

Sergeant NUTTALL, who was a member of the Grimsby Corporation electricity staff, has been awarded the Military Medal.

The Tunbridge Wells Corporation has decided to raise the salary of Mr. G. A. POWNALL, the chief assistant engineer, by £50—£20 now, and two yearly increments of £15.

General.—Congratulations and good wishes to Captain HENRY M. LEAF, D.S.O., R.M.A., formerly of the London Electrical Engineers, on the occasion of his marriage to Miss A. M. E. CUST, which took place at Chelsea on Tuesday last. Swansea Corporation Electric Lighting Committee has unanimously re-elected Mr. ALEX. SINCLAIR Chairman for the ensuing year, and Abt. Geo. COLWILL Vice-Chairman.

Mr. E. T. SHADERS, on leaving the Sterling Telephone Co., Ltd., Dagenham (Essex), has been presented by the staff and employees with a suit case, and a wristlet watch for his wife.

On the occasion of his marriage to Miss Gertrude Willats South, daughter of Mr. J. A. Smith, of Holmwood, Great Baddow (Essex), Mr. ALBERT EDDINGTON, A.M.I.E.E., assistant manager to the Marconi Co., Ltd., Chelmsford, has been presented by the Chelmsford and London staffs with a silver tea and coffee service, with trays.

A commission in the Egyptian Labour Corps has been given to Mr. ALBERT ARTHUR PIRSTON, district superintendent of the electrical department of the Sudan Government Railway at Port Said, and formerly of the North Staffs. Railway electrical department at Stoke-on-Trent.

Mr. J. E. DUNSON, London office manager for Messrs. Bruce Peabody & Co., Ltd., of Edinburgh, was married on December 6th, at Westbury on Trym Parish Church, to Vera Maud, only daughter of Mr. and Mrs. Willie James, of Glenthorn, Westlawn-on-Trym, Bristol. A few days previously Mr. Dunson was presented with a clock as a souvenir of the occasion from his friends in the firm.

Roll of Honour.—The Military Medal has been awarded to Corporal J. A. BARLOW, Machine Gun Corps, an employee in the public lighting department of Stepney Municipal electrical undertaking, for conspicuous bravery and devotion to duty whilst acting as a runner during recent operations at Passchendaele.

Gunner A. W. CASS, R.G.A., was killed in action on 20th ult. He was a representative of the B.I. & Helsby Cables, Ltd., Newcastle Branch.

Private G. W. WRIGHT, Northumberland Fusiliers, reported missing, was employed at the Blackburn Corporation electricity works.

Private G. HART, of the Argyll and Sutherland Highlanders, who has died from wounds, aged 26, was employed by Messrs. Dick, Kerr & Co., Ltd., Preston.

Signaller W. WATERMAN, West Yorks. Regiment, who has died of wounds, was an electrician with his father at Hyde Park Road, Leeds.

Second-Lieutenant G. WOLSTENHOLME, R.F.C., is in hospital suffering from a nervous breakdown following a fight in the air. He was employed as an electrical engineer with the Rochdale Electric Co., Shawclough, Rochdale.

Private T. WALKER, of the Lancashire Fusiliers, killed in action, was employed by Messrs. W. T. Glover & Co., Ltd., Trafford Park.

Lieutenant ALEX. LAING, R.E., aged 25, whose death is reported, was employed at the Wigan Corporation electricity works, and later in the Blackburn Corporation electricity department.

Private R. H. SMITH, A.S.C. (Motor Transport), killed in action, served his apprenticeship at Canterbury with Mr. E. J. Philpot, electrical engineer.

Private J. W. MORRIS, Royal West Kent Regiment, killed in action, was at the outbreak of war engaged in Brazil with the Western Telegraph Co. He returned home to join up in June, 1915.

Corporal W. J. RUSSELL, who was with Messrs. Siemens Bros., of Woolwich, has died of wounds received in action.

Private B. PARR, N. Staffs. Regiment, reported killed after being missing, was on the staff of Messrs. Taylor & Tunnicliffe, Hanley.

Driver C. W. GARDINER, who has died of wounds, and who recently won the Military Medal for gallantry, was an electrical engineer, formerly with Messrs. C. Lee & Sons, Bath, and Messrs. Street, of Bournemouth.

Lieutenant R. C. NUDDS, R.E., who has died of wounds, enlisted at the outbreak of war from the staff of the British Westinghouse Co., Ltd., Manchester.

Private G. H. PAYTON, who was on the staff of the Midland Electric Corporation, Ltd., has fallen in action.

Captain ALDER LEWIS TRIBE, King's African Rifles, younger son of the late Mr. Alfred Tribe, F.R.S., has been killed in action.

Captain A. M. MACDONALD, M.C., Seaforth Highlanders, who has been killed, was completing a course of electrical engineering at Aberdeen when war broke out, and he enlisted.

Private F. DURMAN, an electrical engineer, formerly of Glasgow, has been killed in action.

Captain NORMAN TAYLOR (30), R.E., who has been mentioned in dispatches, was engaged with his father in the firm of Messrs. F. W. Taylor & Co., electricians, Albion Works, Milsbridge.

Mr. J. A. Robertson, borough electrical engineer of Salford, has received information from the War Office that his son, Second-Lieutenant C. A. ROBERTSON, of the 8th Manchester Regiment, is missing. Previous to joining the Officers' Training Corps in October, 1916, Second-Lieutenant Robertson was employed in the works of the British Westinghouse Electric and Manufacturing Co., Ltd.

NEW COMPANIES REGISTERED.

H. & E. Donald, Ltd. (149,068).—Private company. Registered December 6th. Capital, £5,000 in £1 shares. To take over the business of copper-smiths, manufacturers of copper cylinders, boilers, pans, dome-topped boilers, calorifiers, cisterns, &c., carried on by H. B. Donald and E. S. Donald, at South Accommodation Road, Leeds; also to carry on the business of electrical engineers, &c. The subscribers (each with one share) are:—H. B. Donald, 82, Dewsbury Road, Leeds, copper-smith; E. S. Donald, Windsor Terrace, Garforth, copper-smith. The first directors are:—H. B. Donald and E. S. Donald. Registered office: South Accommodation Road, Leeds.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Brecknell, Munro & Rogers, Ltd. (79,766).—Capital, £20,000 in 2,000 pref. shares of £5 each and 20,000 ord. shares of 10s. each. Return dated November 19th, 1917: 11,829 ord. and 1,058 pref. shares taken up; 10s. per share called up on 767 ord. and £5 per share on 1,058 pref.; £5,673 10s. paid; £7,031 considered as paid on 14,062 ord. Mortgages and charges: £7,900.

Wright & Wood, Ltd.—Satisfaction in full on November 24th, 1917, of mortgage dated August 28th, 1917, securing £520 16s.

Hackbridge Cable Co., Ltd. (146,684).—Capital, £25,000 in £1 shares. Return dated September 15th, 1917. 20,000 shares taken up; £2 paid; £19,998 considered as paid. Mortgages and charges: Nil.

Blackburn, Starling & Co., Ltd. (61,302).—Capital, £12,000 in £1 shares. Return dated July 27th, 1917. All shares taken up. £8,100 paid; £3,900 considered as paid. Mortgages and charges: Nil.

CITY NOTES.

The report for the year ended June 30th, 1917, states that the balance to credit of profit and loss is £34,681, from which is deducted interest on both classes of debenture stock, £15,987, leaving a profit of £18,695, plus £4,025 brought forward, leaving an available balance of £22,720, which is dealt with thus:—Munition levy to June 30th, 1916, £7,295; to write down expenses of issue of preference shares, £2,158; carried forward, £13,267. The capital expenditure during the year, before providing for depreciation, amounted to £10,900, of which £3,400 is in respect of additions to buildings, and £7,500 to plant and machinery, the latter being almost wholly for extensions to the lamp works. The profits shown in the accounts, taking into consideration the difficulties the company had to contend with during the year under review, and as were foreshadowed in the chairman's speeches when dealing with the fresh issue of capital, are as high as the directors had anticipated. The proceeds of the issue of the 100,000 preference shares shown in the balance sheet was not available for the company's business until within a few days of the close of the financial year, therefore the trading for that period received no benefit from this additional capital, whereas, as had been previously pointed out to shareholders, the lack of working capital seriously hampered the company's previous operations. Although every endeavour has been made, in entering into contracts, to provide for the increased cost of production arising from time to time by the rise in wages and cost of raw materials, it has been found impossible to synchronise the price obtainable for the company's products with the spasmodic and rapid advances in wages, over which the directors had no control, and this is reflected in the reduced gross profits earned. With the advent, however, of the new capital, enabling the company to take full advantage of discounts upon some of the raw materials purchased, which discounts are, however, now being considerably restricted, and generally to buy on better terms, it is hoped that the accounts for the current year will show more encouraging results.

The engineering side of the works has been, and still continues to be, almost wholly employed on Government orders. The output of lamps has suffered in consequence of large numbers of skilled employees, trained at the expense of the company, leaving the works to take up munition work elsewhere, necessitating the training of fresh workers. This difficulty has to some extent been overcome, and since the period covered by the accounts the output of lamps has largely increased, and manufacturing costs have been somewhat reduced.

The company's operations abroad have been much hampered by reason of the difficulties in obtaining adequate shipping freights, resulting in the Colonial branches not showing that expansion they would have done under normal conditions, and satisfactory profits cannot be looked for in this direction during the continuance of existing conditions.

The anticipated profits have been still further reduced, to the extent of approximately £2,500, by the fact that the company's holding in deferred shares of Altrincham Electric Supply, Ltd., has, during the past year, produced no return, that company's operations having been affected by the Daylight Saving Bill, general economies in the use of current for domestic lighting, and the high price of coal. Additional power contracts, however, have recently been entered into, and it is hoped that a fair return from these shares will be forthcoming during the current year.

There is a considerable sum due by the company for loans, which the board is anxious to reduce as early as possible, and with the commitments for munition levy, interest on the debenture stock due January 1st, and dividend on preference shares due in February, the available cash, although showing a far stronger position by reason of the proceeds of the preference share issue, will not leave more than sufficient margin to carry on the business and meet these engagements; for these reasons the directors are not in a position to recommend a dividend upon the "A" shares.

India-Rubber, Gutta-Percha and Telegraph Works Co., Ltd.

The accounts for the year ended September 30th, 1917, show, after making provision for doubtful debts and war contingencies reserve, which includes excess profits duty, a net profit of £162,149, plus £40,216 brought forward. The preference dividend absorbed £12,500, interim dividend on the ordinary shares £12,500, and there is restored to reserve fund £50,000, leaving the disposable balance at £127,356. A final dividend of 15s. per share, free of income-tax, on the ordinary shares, is recommended, making 10 per cent. for the year; £30,000 is to be put to officers' and employees' staff fund, and £59,866 is to be carried forward. At the meeting on 20th inst. shareholders will be asked to vote £30,000 towards an officers' and employees' staff fund. Col. Weston Jarvis is with H.M. Forces in France, but Capt. Nigel Hanbury is at present home for a short time on leave.

Cape Electric Tramways, Ltd.

Mr. L. BRITMEYER presided at the annual meeting, held in London on December 5th. Referring to the improvement that had taken place in traffic receipts, he said that the number of passengers carried on the Cape Town and Port Elizabeth systems was the highest on record since the flotation of the company. Unfortunately, the working expenditure was also a record, and was greatly in excess of that of normal times owing to the universal prevailing conditions—high cost of materials and wages, and the additional taxation recently imposed by the Union Government of South Africa. In Cape Town, owing to an unusually dry season, a very serious water famine was experienced, which necessitated the undue use of salt water for road watering purposes to the detriment of the permanent way, as salt water corroded the rails more than ordinary water. Fortunately their own water tank storage capacity was sufficient to supply all the water necessary for the service of the boilers during the hours of the curtailment of supply, so that no serious inconvenience was actually caused to the running of the system. The outlook for the coming year was promising, but the difficulty of obtaining supplies was still a matter of grave anxiety.

Adelaide Electric Supply Co., Ltd.—Mr. R. P. SELLON presided, on Monday, over an extraordinary general meeting at Finsbury Pavement House, E.C. He said that, as last year, owing to delays of the mails consequent upon the war they were not able before the end of the year to issue the audited accounts and hold the annual general meeting. The directors had, however, assured themselves by communication with the local directors at Adelaide, that the year's results warranted the declaration of the usual final dividend upon the ordinary shares. They had felt that it would be for the general convenience of the shareholders that that matter should be dealt with without waiting for the accounts. These had now come to hand, and it was anticipated that they would be able to hold the annual meeting early next year. He moved that a final dividend be paid on the ordinary shares of 7 per cent., free of British income-tax, making 12 per cent. for the year.—The resolution was carried.

Ross Electric Light & Power Co., Ltd.—For 1916 the gross revenue was £1,185, as against £1,315 for 1915; the expenditure was £1,141, as against £1,026, leaving a balance of £44 to be carried to net revenue. The loss brought forward from 1915 was £57, and allowing for £282 interest on temporary loans the net loss is £298. Energy sold for lighting fell 15 per cent., but to meet this to some extent the proportion of units generated to units sold was reduced. The company applied to the Board of Trade for the revision of the maximum charges for current, and there being no valid objection made, the maximum charges were raised from 7d. per unit, and for any quantity up to 20 units per quarter 11s. 8d. respectively, to 8d. per unit and 13s. 4d. per quarter. There were 155 consumers (142 lighting and 13 power) 6,089 30-watt lamps equiv.) at the end of 1916.

Barbados Electric Supply Corporation, Ltd.—The trading profit for the year ended June 30th, 1917, was £2,970, against £2,633 for 1916, and £2,231 for 1915. £495 has been charged against trading for repairs and renewals, as against £514 in 1916; this consists chiefly of the cost of replacing poles. The greater part of the work of replacement has now been carried out. The number of consumers advanced from 1,222 to 1,403 during the year, and the 25-c.p. equivalent connections from 17,489 to 19,562. In view of the difficulty of obtaining materials of all kinds, the progress is considered satisfactory. Capital expended during the year: £1,191 for further house connections and additions to mains. The loan which fell due for repayment on June 20th, 1917, has been renewed for a further five years.

Manx Electric Railway Co., Ltd.—Gross receipts for year ended September 30th, £9,573; gross expenditure, £9,625; loss, £52. Adding the debit balance brought forward £19,170, and debenture interest £9,000, there is a debit balance on revenue account of £28,222. The passengers carried were 119,683, against 111,982 in the previous year, as against between 700,000 and 800,000 in normal years. The above debenture interest has again been funded by the issue of second debentures.

Power-Gas Corporation, Ltd.—The results of trading during the year to September 30th show a profit of £21,915, plus £11,120 brought forward. Dividend 6 per cent. per annum on the ordinary shares, less income tax, £11,977; £1,380 to reserve, and £13,678 carried forward.

Eastern Telegraph Co., Ltd.—Dividend at the rate of 3½ per cent. per annum, less income-tax, on the preference stock for the quarter ending December 31st, 1917, and the third quarterly interim dividend of 1½ per cent. on the ordinary stock, free of income-tax.

Calcutta Electric Supply Corporation, Ltd.—The number of units sold to consumers during the four weeks ended October 26th, 1917, has amounted to 2,210,246, compared with 2,038,767 units in the corresponding four weeks of 1916.

Coventry Chain Co., Ltd.—Dividend of 7 per cent. on the ordinary shares for the half-year ended August 31st last, also a bonus of 5 per cent., making 15 per cent. for the year, less tax.

British Vacuum Cleaner Co., Ltd.—Profit for the year ended September 30th, £2,095. Dividend at the rate of just over 2½ per cent., carrying forward £1,041. There has been an improvement in the company's position during the year.

J. F. & G. Harris, Ltd.—The net profit for the year ended at June 30th, 1917, was £529. The preference dividend absorbs £282. £121 is carried forward.

Canadian General Electric Co., Ltd.—Quarterly dividend of 2 per cent. for the three months to December 31st, being at the rate of 8 per cent. per annum, on the common stock.

Hungary.—The Felten und Guillaume Kabel, Draht und Drahtseilfabrik Gesellschaft, of Budapest, is increasing its capital from £40,000 to £120,000.

East London Railway Co.—Interest 8s. 9d. per cent., less income-tax, on "B" debenture stock for the year.

STOCKS AND SHARES.

TUESDAY EVENING.

Most markets in the Stock Exchange are dull and depressed. The principal reason is the state of affairs in Russia, with the possibility of peace negotiations between that country and Germany resulting in the release of such numbers of enemy troops as may increase the difficulties on the other fronts. Money is fairly plentiful, but there is no particular anxiety on the part of the public to invest it, and the success of the War Bonds is, of course, one of the minor factors in the situation that makes for heaviness in Stock Exchange markets. Amongst the few satisfactory spots may be counted the strength of electricity supply shares, and the firmness of the manufacturing issues as a whole, while the attractions of the good-class cable companies come more and more prominently into view as the chance of an increase in the income-tax grows stronger.

In the list of manufacturing shares, British Westinghouse Preference have fallen ½ in consequence of a few sales by holders tired of waiting for developments that do not develop. The Edison Swan report is now available, and nothing is said therein with regard to the rumours which have been current as to a possible agreement of interests amongst the manufacturers. The company has done only fairly well; gross profits show a falling-away as compared with those of the previous twelvemonth. The accounts go up to the end of June last, and the report points out that the proceeds of the issue of the 100,000 Preference shares was not available until within a few days of the close of the financial year. The directors state, however, that with the advent of this new capital, enabling the company to take full advantage of discounts and other terms, it is hoped that the accounts for the current year will show more encouraging results. As we anticipated last week, no dividend is declared on the "A" shares. The price has fallen about a florin on the issue of the report, and is now 25s. 9d. On the other hand, the company's 4 per cent. debenture stock has hardened to 75½.

The big rise in the price of India-Rubber shares which has taken place recently finds an excellent reason in the report just issued. The record for the past few years shows remarkable fluctuations. Whereas in 1913-14 there was a loss of nearly £19,000, in 1914-15 this was converted into a net profit of £80,000, which further jumped to £134,000 last year. The net profits for the year just ended are now returned at £162,000, so that in four years there is a difference of no less than £180,000 in the profits. The directors retain the dividend at 10 per cent., which is, paid free of tax, equivalent to 13½ per cent. under the gross rate, and they carry forward £90,000, an increase of nearly £20,000 as compared with last year. Once more the price is 5s. better at 11½. General Electrics reacted a little to 20. Henley's have enjoyed the substantial spurt of 15s. to 16½.

The telegraph market is good throughout, Eastern Ordinary and Preference all being wanted. Eastern Telegraph has risen to 150½. "China" shares to 15, and Western Telegraph to 15½, being what the Stock Exchange calls a good market. A dull spot is provided by Marconis, where the price of the shares has slipped back to 32, while Americans reacted sharply to 25s. 6d. with a subsequent rally to 24s. This fall came about on the sales by speculative buyers apprehensive of the general outlook. Other descriptions of Marconis are also a little weaker, but it is in Americans that the principal activity has occurred.

Electricity Supply shares are quietly firm. No changes have occurred in the price lists of the London companies. Newcastle-on-Tyne ordinary have gone back to a pound. British Electric Traction are dull, the ordinary has weak-

ened to 32½, while the participating preference keeps about 74½. Transport issues are not popular just now. Home Rails remain depressed and weary. Underground "A" shares dropped to 5s. 6d. Metropolitan Consolidated is ½ down at 22. London & Suburban Traction ordinary changed hands at half-a-crown on Monday, the preference at 6s. 6d., and the ½ per cent. first debenture stock at 61½. London United Tramways 4 per cent. debenture has also been dealt in this week, at 35. The last payment of interest on the stock was made nearly a year ago.

The whole of the Mexican Utility group is very flat. Mexico Tramways First Mortgage bonds have lost 7½, and the Light & Power Co.'s Firsts are 6 lower. Pachuca Fives have slumped to 32½, and the other issues of the concerns, while showing less drastic drops, are well-nigh nominal in their prices. Affairs in Mexico seem to drift from worse to worst, and the apparent hopelessness of the situation is making holders of Mexican bonds ready to sell for whatever they can get.

Brazilian Traction keep firm, although the Rio rate of exchange is a trifle unsteady. Anglo-Argentine Trams first preference are 1/16 down; none too great confidence is felt in the chances of the next dividend being paid. Bombay Electric preference gave way ½, other Indian shares retaining their strength.

Babcock & Wilcox have receded along with most other iron and steel descriptions; the shares at 3 3/16 are 3/32 lower. Rubber shares are flat, on a fresh decline in the price of the produce. The various markets for tin-mining issues are better. Armaments are dull, with a few exceptions, of which Vickers stand out conspicuously. Business in most of the markets runs on very thin lines.

GAS FIRING BOILERS.

By T. M. HUNTER, M.A., B.Sc.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS.)

(Concluded from page 551.)

Boiler Draught.—The efficiency of a boiler depends for any given combustion arrangement on two factors—the gas pressure and the chimney draught. Gas pressure regulates the quantity of gas admitted to the boiler; the chimney draught regulates the air drawn in at the boiler front, and also the speed at which the products of combustion travel through the boiler. Given a gas which does not materially change in its composition, a boiler will always give uniform results provided that the gas pressure and the chimney draught are constant. If the products of combustion travel through the boiler at a certain constant speed, the question of regulating the gas is a comparatively easy one; whereas if a boiler is joined to a stack, the question of draught is more difficult. The draught obtainable from a given stack varies with the temperature of the waste gas entering the stack and with the outside temperature of the atmosphere. For this reason the author would advocate where possible the adoption of automatic damper control, or of induced draught. With a constant draught and a constant gas pressure there should be no difficulty whatever in obtaining a constant maximum efficiency on a gas-fired boiler.

The theory is often propounded that the efficiency of a boiler increases with the velocity of the products of combustion; this theory is incorrect.

Boiler Settings.—Boiler settings sufficiently substantial to limit the conduction losses by insulating a boiler are equally necessary for coal and gas-fired boilers. It is preferable to have a poor boiler with a good setting than the best boiler with a bad setting.

The losses of efficiency by way of boiler settings are twofold—the loss through infiltration of false air into the boiler through the brickwork, and the loss by radiation and conduction of heat from the boiler out through the brickwork. As regards the entry of false air, all this air must be heated to the exit temperature of the gases. The actual heat thus carried away to the chimney is not the whole of the loss, as there must also be taken into account the loss in temperature of the flue gases when mixed with the false air. This lowers the ratio of the temperature of the gases to the temperature of the boiler tubes, and therefore reduces the efficiency of the heat exchange. The loss of efficiency by infiltration of false air is in many cases 15 per cent. or more.

The procedure in order to discover air leakages in boiler settings is very simple. If a sample of the waste gas taken at a distance of 15 ft. from the burner nozzles, or in the case of Lancashire boilers at the end of the first flue, yields a certain percentage of CO₂, the same proportion of CO₂ should prevail throughout the boiler. Should there be a decrease in CO₂, it would prove the presence of air leakages, and by taking tests at varying distances from the burner nozzles, the places where air leakages occur can be exactly ascertained. As soon as these air leakages have been found they must be stopped. The first thing to be done in such a case would be to clean the outer side of the brickwork settings thoroughly, remove all loose mortar, and repoint the brickwork. This will, as a rule, greatly improve matters, but brickwork settings have generally a very large number of small crevices which are hardly visible to the eye. In order to close these it is necessary to cover the brickwork settings with several coats of thick tar, which should be renewed from time to time until the whole of the brickwork is covered with $\frac{1}{4}$ in. layer of tar.

The losses through radiation and conduction of heat from a boiler are not sufficiently realised. When we consider that there are boilers which lose $\frac{1}{2}$ per cent. from these causes, and others which lose 15 per cent., it is evident that matters require attention. Owing to the difficulties of accurately measuring large volumes of gas in the state in which it is used for boiler firing, it is practically impossible to measure directly the radiation loss while gas firing a boiler. The usual practice is to test this loss when coal firing the boiler, and to assume that the loss is the same while gas firing. The results of a large number of tests of well-protected boilers, which were published some time ago, showed that in no case was the radiation loss over $2\frac{1}{2}$ per cent.

One very common mistake, for which one has to pay very dearly, is to have boilers in the open air, and not in a boiler house. As the radiation losses are dependent on the temperature inside the brickwork, the thickness of the brickwork, the temperature on the outside of the brick, and the wind velocity, the radiation losses in the winter months, with rain and high winds, must be very much larger than in the case of summer heat. A 30 ft. \times 8 ft. Lancashire boiler working continuously on gas raises steam worth over £2,000 per annum at present. It is possible in almost every case to save 5 per cent. in the radiation loss by putting a house round a boiler, saving £100 a year.

Another mistake which is very frequently made is that the brickwork is not thick enough. It is no economy to build

light boiler settings, as the additional cost of heavier walls, &c., will very soon be repaid on the savings in radiation. For a Lancashire boiler in the open air, the radiation loss from the exposed front is about 1 per cent., showing a loss of £20 per annum, a sum which would pay many times for the cost of a suitable covering. As a rule, modern water-tube boilers have suitably thick brickwork settings.

In cases where it is not convenient or practicable to determine the losses of a boiler through radiation and conduction of heat by means of a careful test of the boiler with coal firing, these losses may be roughly estimated at the following figures:—

	In boiler house.	In open air.
Water tube boiler	1 $\frac{1}{2}$ p.c. to 3 p.c.	6 p.c. to 8 p.c.
Lancashire boiler	5 p.c.	10 p.c. to 12 p.c.

Combustion.—A good combustion arrangement will give complete combustion with an excess of air of 10 per cent.; but with the usual industrial gases there are such large fluctuations in the composition and calorific value that we do not usually dare to reduce the excess of air for continuous working under 20 per cent. on account of the danger of having unburned gas in the waste gases. Good combustion can only be attained by providing an intimate mixture of air and gas. Complete combustion should take place very rapidly, at the highest possible temperature, and with the smallest possible excess of air.

Each case has to be considered in all its details. It is not always safe to say that a certain combustion arrangement will suit because it is working successfully in another plant under somewhat similar conditions.

Combustion arrangements have to be designed to suit three different conditions of gas pressure:—

1. Steady pressure of 1 in. water gauge or more.
2. Intermittent pressure, ranging constantly from 1 in. water gauge or more, to nil, with total stoppage of the gas flow and extinction of the flame.
3. Very low gas pressure, or a pressure which may sometimes be high, but is low for considerable periods.

(1) For a steady gas pressure the Bunsen type of burner gives the best results. A good burner of this type provides its own primary air, which amounts to 60 per cent. of the air necessary for combustion. The gas, acting as an injector, draws in this air, and also mixes thoroughly the air and gas before ignition takes place. Whether or not the burner is doing its duty in this respect can be tested by taking a CO₂ reading of the gas-air mixture in the burner barrel. The secondary air, which is just as essential, is drawn in by the chimney draught, in conjunction with the injector action of the mixture emerging from the burner nozzle.

The maximum flame temperature should be found in the region of the boiler within a few feet of the burner, and there should be a minimum volume of flue gases carrying away heat to the chimney. The amount of gas to be burned in a boiler is only limited by the volume of gases with which the flues can deal under the conditions of gas pressure and chimney draught. Thus the boiler output is larger than it could possibly be with a bad combustion arrangement, in addition to the efficiency being improved.

(2) Intermittent gas pressure is found at most ironworks having no gas-cleaning plant. Each time a bell is lowered to admit the charge into a blast furnace, the gas pressure drops, and usually the gas fails altogether. Ordinary Bunsen-type burners are useless under these conditions. They light back at the gas inlet inside the mixing tube, and each burner requires attention from the boilerman every time the pressure falls—say every 10 minutes—an impossible proposition. It is only very recently that this problem has been solved. Burners have been developed which draw in and mix primary air with the gas in a similar manner to the Bunsen burner. These burners work on the injector principle. Their mixing tubes are made conical, expanding in cross-section from the gas inlet to the burner nozzle. This form offers practically no frictional resistance to the flow of the mixture of gas and air. It is well known that a flame travels through a mixture of air and gas at a certain definite speed for a known mixture. The burners are so proportioned that the speed of the mixture of air and gas at the burner nozzle is greater than the speed of the explosive reaction of the flame, and therefore, when the gas pressure is present, the gas burns at the end of the burner. When the gas pressure falls the gas burns at that point where the speed of the gas-air mixture corresponds to the speed of the flame. When gas fails, the flame is extinguished, and a small coal fire is kept in the boiler to ignite the gas when it returns. As soon as gas pressure returns, the velocity of the gas-air mixture forces the flame out of the mixing tube, and combustion continues at the burner nozzle as before.

It is found that this burner automatically adjusts over considerable variations of gas pressure, the weight of primary air drawn in to the weight of gas passing on account of the absence of friction in the mixing tube. At one English ironworks, on a Lancashire boiler working at a gas pressure of about 1-in. water gauge, it is found that the temperature of the waste gases is 315 deg. C., while the temperature in neighbouring boilers fitted with the old combustion arrangement is from 700 deg. C. to 900 deg. C., with combustion still taking place at the dampers.

- (3) To deal with gas at a very low gas pressure, and to get

a good mixture of gas and air, is impossible without mechanical assistance. No burner will mix them properly. A Bunsen-type burner would light back at once at such low gas pressures.

If the pressure of either gas or air is raised to 2 in. or more, the conditions are then similar to those in (1) where a steady gas pressure exists. The mixing in the burner is done either by the gas or by the primary air entering under pressure; and the secondary air is drawn in at the burner nozzle as usual. To raise the gas pressure, a fan is inserted in a bypass on the gas main, and three valves are provided to cut off the fan on each side and to close the gas main when the bypass is open. The fan to raise the air pressure has only to deal with 60 per cent. of the air required, but an air main is required connected to each burner. Although both these methods are costly, the results, both as to additional boiler load and as to improved efficiency, are so satisfactory as to pay many times over for the outlay.

When a short, intense flame is required, we must use either air or gas under considerable pressure. This method is well known in the case of gas furnaces for reheating and melting. From $1\frac{1}{2}$ to 2 lb. per sq. in. pressure on the air supply is the most suitable pressure, though excellent results are got with 12-in. (water gauge) pressure. The whole of the air needed for combustion is supplied by the mixing arrangement, no secondary air being used. The author believes that by this method, which puts the boiler under pressure, and by simply drawing off the products of combustion by the chimney draught, we should make a considerable advance in the direction of large boiler outputs combined with high efficiency.

A smaller combustion space is needed in proportion as the air and gas are more intimately mixed in the burners.

Preheated air and hot gas are of great advantage for boiler firing. Air preheated to 190 deg. C. was used at one plant, with producer gas of 150 therms per cu. ft. The sensible heat of the air added 5 per cent. to the calorific value of the gas, and thus raised the flame temperature. It depends upon where the heat is got, whether it really adds anything to the total efficiency. If the air or gas is heated by waste gas, say in an economiser or in passages outside the walls of the boiler, the heat then supplied is all clear gain.

Gas Measurement.—If the evaporation of a boiler is known, the only other thing required is to know the quantity of gas consumed. Here a serious difficulty arises. Wherever a large quantity of gas is concerned, gas measurements are difficult, and where the gas is of high and varying temperature and carries a large quantity of dust, they are next to impossible. Velocity measurements, with the assistance of the Pitot tube or throttling disk, or anemometer, cannot be trusted to give absolute readings, but they are very effective in giving readings which are relatively correct from day to day. To obtain the actual values there is no other way but to resort to theoretical calculation, and to draw up a balance-sheet for the carbon.

A meter of the rotary type should be calibrated by means of a gasometer, both before and after use, with the actual gas it is measuring. If this is not done, large errors may arise. With Pitot tube meters, the Pitot tube must be kept clean, and should be examined and blown out at short intervals. Meters working by the difference of pressure on the two sides of a throttling disk in the gas main are less apt to deceive than Pitot tube meters, because they are not so liable to be affected by eddies in the gas flow. Velocity readings should never be used unless the pipe in which they are taken is straight for about 10 diameters' length on each side of the point of reading. The author has used both Pitot tube and throttling disk gas meters at several different plants, and on the whole has had reason to be satisfied with the readings they gave of relative volumes.

Boiler Control.—There are three methods by which we can test what results are being got by a boiler, namely, (1) by measuring the gas supplied and the water evaporated, (2) by analysing and taking the temperature of the waste gases, as described above, and (3) by taking the combustion temperature. All these methods are good. The chemical method is slower and more laborious than the pyrometer method, but it is cheaper and gives much more information.

For testing the combustion temperature a pyrometer junction is inserted in each boiler flue within a short distance of the nozzle of the burner. All these junctions can be wired to one dial, with switches to connect each junction in turn to the dial. Such an arrangement is especially desirable if the engineer in charge has no time to be constantly at the boiler plant. He can have the dial in his office, and can at any moment read the temperature in front of each burner nozzle, and give instructions to the boilerman to attend to such burners as are not working satisfactorily.

A CO₂ recorder on the boiler flue is an excellent check on the results. It will be realised, however, that very deceptive deductions may be made from the readings of this instrument. Although the CO₂ reading is good, there may be unburned CO present, causing serious losses. If an instrument were fitted to record CO₂ and CO simultaneously, it would be the ideal arrangement for the chemical control of gas-fired boilers, and the author sees no reason why such an instrument should not be made and sold at a reasonable price.

A gas-pressure gauge should be fitted, if not at each boiler,

at least at every range, in a place easily seen by the boilerman. In addition, a differential draught gauge should be fitted to each boiler, showing the difference in draught between the front and back of the boiler, and a plain mark should be made on the dial at the reading which the boilerman is to maintain by means of his dampers. With these gauges it is an easy matter to instruct a boilerman how to control his burners without trusting alone to the appearance of the flame, even under varying conditions of gas pressure and chimney draught. On large boilers working at steady gas pressure it pays well to install automatic damper control to maintain a uniform chimney draught.

Water meters are a necessity for careful boiler control. At least one meter to every range of boilers is necessary. Gas meters should also be installed.

In all large works a man should be appointed to take general charge of the steam output. He need have no great chemical or engineering training, as his business is simply to run his boilers at their maximum efficiency, and all engineering matters would be reserved for the engineer or manager. A suitable man can be got for £4 a week in ordinary times, but of course he would require a little training from a chemist or engineer before he fully understood his duties. The author has trained one such man, and found that he picked up the requirements very quickly and carried out his duties most successfully. At a works raising 100,000 lb. of steam per hour the value of the steam is about £40,000 per annum. If the man in charge of the boilers, by his effective control, improves the efficiency by only 5 per cent., the £2,000 saved will pay his salary many times over. In addition, there is the advantage that the maximum possible supply of steam will always be secured. Even with the best combustion arrangements, the result of intelligent control will be a saving of at least 5 per cent. as compared with the results to be attained with the same installation run simply by boilermen, so that there is no possible excuse for a company that neglects to appoint such a man. In large American works the steam engineer is a recognised necessity, and he is a highly paid official.

The best outfit of recording instruments is useless unless a constant and intelligent use of them is absolutely enforced. All the temperatures, pressures, volumes, and analyses taken should be entered up in a special book. At least once a week a balance-sheet should be drawn up, showing the allocation of the gas to each part of the work and the results obtained therefrom. This should be submitted to the manager weekly, with the necessary explanation in case any result falls short of the required efficiency. If, in addition to this, the boilermen and the man in charge of the boiler plant are given a premium for maintaining good results, boiler control will soon develop into a fine art, and prove an important source of revenue.

PYROMETERS AND PYROMETRY.

DISCUSSION AT THE FARADAY SOCIETY'S MEETING.

(Concluded from page 534.)

Applications of Pyrometry to the Metallurgy and Heat-Treatment of Steel.—A group of papers, and as many speeches, dealt with this important aspect of the subject. Whatever may in the future be the outcome of some of the newer methods of measuring high temperatures already referred to, at present the various forms of optical pyrometers hold the field—not without a good deal of unfriendly criticism—for taking the temperature of molten steel. If the contention of Dr. W. ROSENHAHN proves to be correct, that the future must lie with a pyrometer the sensitive members of which are outside the furnace, this must always be the case, but it is well not to dogmatise on the future. Mr. J. A. RHODIN's view was that the optical pyrometer was essentially unsatisfactory, on account of the personal equation involved. The truth appears to be that this type of instrument is capable of extraordinary accuracy if it is used by carefully-trained observers and under proper conditions, namely, "black body" conditions, or the necessary corrections made if these be imperfectly fulfilled. The optical properties of the glass for the eyepiece was not to be lost sight of, Dr. J. A. HARKER reminded the meeting. These are fairly simple qualifications, and yet it would seem, judging from many speakers, that they are not clearly grasped even by expert users of pyrometers. One of the most fruitful results of the discussion should be to emphasise the care with which pyrometers have to be used—especially for temperatures above 1,500 deg. C.—and their readings interpreted. As to their limits of accuracy, Mr. COSMO JOHNS actually talked of variations of ± 2.5 deg. C. in readings taken at some 1,600 deg. C., and Prof. J. O. ARNOLD, F.R.S., using, in a particular series of experiments, five different types of pyrometer (the P ry thermoelectric radiation, the P ry bimetallic spiral spring, the Foster base-metal thermocouple, a modified Wanner radiation, and a M sure and Nouel radiation pyrometer), and employing different observers, arrived over a wide series of readings at a grand mean temperature of 1,296 deg. C., when 1,300 deg. C. was the temperature aimed at.

Both Mr. Cosmo Johns (Sheffield) and Dr. A. McCance (Glasgow) spoke on temperature determinations of liquid steel. Dr. McCance has now evolved a system under which nearly 12,000 determinations are made in the course of the year, using the Siemens optical pyrometer. His experience was that frequent standardisation was necessary, but if the proper precautions were taken, the apparent temperature of the slag surface could be kept constant between 1,630 deg. and 1,650 deg. C., to the great advantage of the furnace lining. The true temperature would be the apparent temperature less an amount depending on the temperature of the flame and the emissivity of the slag. The true temperature of liquid steel he considered to be 1,600 deg. C., and castings below this gave cold heats. Dr. W. H. Hatfield (Sheffield) found a disparity as great as nearly 200 deg. C. between the readings of the temperature of molten steel by a thermo-couple and the Cambridge optical instrument, due, of course, to imperfect black-body conditions. Both Dr. Hatfield and Dr. McCance had much to say which was of great interest as to the practical precautions to be taken in work of this kind, for which reference must be made to the full report of the discussion that will be published in due course. The bearing of the emissivity of the molten metal surface on optical pyrometer readings was discussed in some detail by Prof. F. G. Donnan, F.R.S. (University College, London), who showed curves and tables giving the necessary corrections in the case of gold, silver, and copper. It would be very useful if similar curves could be obtained for iron, steel, and molten slags. Mr. Cosmo Johns gave the results of his experiences of temperature measurements of molten steel, taken with optical pyrometers using monochromatic light, a system that had been in regular works practice for nearly four years. It appeared that skilled observers were able unaided to distinguish differences of 15 deg. C. when steel was flowing into a ladle, and 10 deg. when running into an ingot mould, so that any system of pyrometry called for an accuracy of ± 5 deg. C. More than this was attainable by trained observers if standard conditions of observation were adopted. Mr. Johns proceeded to state these conditions, both as regards the proper part of the stream to observe and the relative time of observation, seeing that the temperature of a flowing stream was bound to be either rising or falling. Observations on the temperature of the interior linings of furnaces after the steel had run out were of considerable interest as bearing on the softening or fusion range of the refractories employed. Under proper conditions, every detail inside the furnace was visible: joints in the brick work, junctions of sand banks with the side walls, port openings, and places where wear had occurred could all be perceived. A research on the emissivity of silica bricks at steel-furnace temperatures was called for. Dr. McCance's experiences agreed closely with those of Mr. Johns.

The application of pyrometry to the hardening of high-speed tools was discussed by several speakers, notably by Prof. J. O. Arnold. At Sheffield University the practice is to immerse the tool in a bath of barium chloride fused by a current which passes into it through iron electrodes. Perfect regularity of temperature is attained, 1,300 deg. C. being the point aimed at. Mr. P. Peckman (Manchester) keeps a temperature record of his hardening furnace by inserting a thermocouple into the bottom or side of the furnace. The readings of this being standardised it acts as a check, and it is unnecessary to take the actual temperature of the high-temperature zone. For the calibration of thermocouples he suggested, incidentally, to use a piece of steel of known transformation point. Mr. W. Carter voiced the opinion of many users when he urged the use of two kinds of pyrometers, a rough type for works use and a laboratory type for checking.

Pyrometry in Glass Making.—Some interesting remarks on this side of the subject were made by Mr. C. J. Pridde (Sheffield). In the glass industry the value of scientific pyrometry was just beginning to be appreciated. He advocated the use of optical pyrometers, first, because in a glass tank one had almost ideal "black body" conditions, and secondly, because thermocouples could not be inserted in the glass, and even in the roof their life was likely to be short. He saw no reason why the monochromatic glass required for optical pyrometers should not be made here. The instrument makers had only to specify exactly their requirements, and he felt sure the glass makers could discover a suitable glass.

The Measurement of High Temperature by Means of Pottery Materials.—Under this title Mr. H. Watkin, of Stoke-on-Trent, contributed what was perhaps one of the most interesting papers in the symposium. Unfortunately, metallurgy monopolised the field so long that it was nearly 10.30 p.m. before the Chairman was able to call upon Mr. Watkin, and his paper passed as read without discussion. The relation of temperature to degree of firing lies at the foundation of the work of the potter, and it is therefore not surprising that he has for long estimated his temperatures by their effect on his clays. Mr. Watkin tabulates these methods of ascertaining high temperatures as follows:—

1. By sight—by the colour of the oven's contents.
2. By the changes red clays undergo when heated.
3. By the translucency of certain trial pieces.
4. By the development of the rose-tint in enamelling colours.
5. By measurement of bulk or contraction.
6. By the feel or touch.

7. By the sense of hearing—judging of the sound when the ware is struck.

None of these time-honoured methods, however, are up to modern requirements, and they have been modified in the direction of greater sensitiveness, reliability, and constancy. The most famous of these improvements was the invention of the Seger cone in 1886, when Seger made up a series of cones having melting points from 1,150 to 1,350 deg. C. A still further use of the same principle has been made by Mr. Watkin in his "heat recorder," which consists of a block of very refractory ware with five circular recesses sunk into its top face. In these recesses are placed little pellets of fusible materials of definite composition and melting point. The fusion-point of each mixture has been carefully determined by comparison with a standard electrical pyrometer. The pieces that become fused are attached to the recorder, and the heat attained is thus definitely registered. These recorders have been found useful in many industries, as in pottery and porcelain manufacture, brick-making, gas works, glass works, and for numerous processes of annealing. The method seems to be unknown outside the pottery industry, and it is, therefore, well that it has had an opportunity to be brought before a wide public, for its simplicity—the absence of any measuring instrument—may render it useful in many an unsuspected direction. It must, of course, not be forgotten, as Mr. W. J. Rees (Sheffield) pointed out in a written communication, that all such methods measure not temperature, but heat-effect, and that the rate of heating has to be considered as well as the temperature attained. For firing pottery or burning refractories it is the amount of shrinkage which is of importance; nevertheless, as Major C. W. Thomas pointed out (also in a written communication), to enable the worker perfectly to control his process he needs to watch the progress of the shrinkage. It ought to be considered whether any method is capable of giving this information short of a recording instrument. This, however, is for the refractory maker to decide.

Exhibits.—A large number of exhibits, comprising probably every type of pyrometer now on the market, added considerably to the interest and usefulness of the meeting. Among the English instruments were to be seen those made by the Cambridge Scientific Instrument Co., the Foster Instrument Co., Mr. R. W. Paul, and Messrs. Siemens Bros. & Co., Ltd. Messrs. Hatfields, Ltd., showed a Harker electric furnace used for standardising optical pyrometers, and also a Brown furnace control pyrometer. Mr. Watkin illustrated his paper with a range of pottery temperature indicators and other specimens, and Mr. G. E. M. Stone showed his base-metal pyrometer referred to in his paper, and also some very instructive examples of faults which pyrometers are prone to develop. The Automatic Electric Furnaces, Ltd., showed the Wild-Barfield furnace for hardening gauges and tools.

ELECTRICITY IN COAL MINING.

At a meeting of the NORTH OF ENGLAND BRANCH OF THE ASSOCIATION OF MINING ELECTRICAL ENGINEERS, at Newcastle-on-Tyne, on November 24th, Mr. C. A. Nelson, the new President, delivered an address. He said there was no mining district in Great Britain which had the electrical advantages of Northumberland and Durham. They had at their call one of the largest electricity supply undertakings in the Kingdom, which, on account of its size, could offer energy to its consumers at a price per unit that no individual colliery could generate at, unless it had some special advantage. Practically all the Northumberland pits would find it to their advantage to take current from this source. During the last six years he had been constantly engaged in substituting electrical for steam plant. The first steps were directed to cutting off the low-pressure boilers, and the inefficient engines working from them. In each case comparative prices and costs were taken of up-to-date steam plant and electrical plant, and it was found in most cases that the electrical plant had the advantage. In comparing the cost of electricity taken from a supply company with that of steam plant, colliery engineers were apt to err in favour of the latter, and he had found by experience that depreciation and maintenance charges for steam plant were much under-rated. For instance, it was wrong only to take the cost of coal used, plus cost of firemen, and repairs and depreciation of boiler plant; they should allow for depreciation, maintenance, and repairs on steam and water-pipe ranges, boiler pumps, joints, special railway sidings, wagons, and bunkers, and, in addition to firemen's wages, their compensation, insurance, house and coals; for the locomotive, the driver and the shunter, as well as for a part of the agent's, manager's, engineer's, and engine-wright's time. The cost of the water supply also was often omitted from the estimate, as well as the cost of dealing with the ashes. As all these things were eliminated by taking current from a supply company, they should be charged against steam. At the actual machinery, there was a considerable saving in oils, packing, grease, &c. In elec-

trical winding he had also found there was a saving in wear and tear on the ropes and cages; and the maintenance cost of the shaft guides, conductors, &c., was reduced by reason of the smoother working. The maintenance of plant when electricity was used was reduced to a minimum, and a point of great importance was its efficiency. A steam engine might work inefficiently for weeks without the engineer being aware of the fact, whereas, with electricity, it was at once apparent on the meters, and could be attended to immediately. The efficiency of electricity, and its elasticity of application, would practically lead to its gradual replacement of all other power, and the sooner this was realised the sooner we should be able to overcome successfully international competition. The industrial development of this country was intimately connected with the development of the use of electric power. Large central supply stations efficiently managed could, owing to the diversity of their loads, do more to help this industrial development forward than any individual. The plant installed at the Wallsend and Hebburn Collieries was of approximately 13,000 B.H.P., and the energy used was 11,000,000 units per annum. They had two large direct-coupled winders, duplicates, and a third was being installed. The motor was 730/1,950-B.H.P., three-phase induction type, wound rotor and slip rings, 50 R.P.M. They lifted from 60 to 72 cwt. of coal per wind, and the units used were 5.7 per wind, the shaft being 1,080 ft. deep. The winders were built by the British Westinghouse Electric & Manufacturing Co., Ltd. Although the old steam winder had a 22-ft. drum, and the electric winder only 12 ft., the life of the rope had increased from two years one month, to three and a half years, when they had to remove it to comply with the Coal Mines Regulation Act, and, as the rope was in excellent condition when taken off, they had decided to apply to the Inspector of Mines to get the regulation time extended in favour of electric winders. It was in underground haulage that electricity, owing to the intermittency of the work, and the distance from its source of power, showed the greatest advantages. For the main haulages it was ideal, and when taken underground it obviated the abomination of a running set of ropes in the shaft, or, the alternative, pipes. For secondary haulages electricity had also great advantages. He had found that for large main and tail haulage gears, the liquid type of controller, with reversing switches, was the best. They had carried out an interesting change by arranging an independent system of ventilation for each colliery at Wallsend, whereby an hourly consumption of 366 units had been reduced to 92.83, a saving of 273.17 units, equal for a year to 2,392,940. The application of electricity to fan drives, with the motor connected directly to the fan, was attended with difficulty owing to the speed of ordinary motors being constant; to overcome this, they were installing a 150-H.P. adjustable-speed polyphase induction motor with seven speeds—260, 300, 340, 400, 480, 600, and 800 R.P.M. If successful, this would allow them to run the fan at a speed which was just enough to give an adequate ventilation, and would allow of easy change in speeds to suit the week-ends and holiday arrangements. The pumping and air compressing was almost entirely driven by electricity, as was the machinery for the screens and shops. At present they were using about 1,000 miners' lamps of the C.E.A.G. type, and, although more expensive in first cost and maintenance, these had in use justified themselves; but he considered there was a great future for a good dry-cell miner's lamp.

Mr. NELSON is the agent of the Wallsend and Hebburn Collieries, Ltd.

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE 1-4, LUDGATE HILL, LONDON, E.C. 4.

Telegraphic Address: "A0EEKAY, LONDON." Code, A B C.

Telephone Nos.: City 997; Central 4225 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, £1 ls. 6d.; Canada, £1 8s. 10d. (\$5.80). To all other countries, £1 10s.

FOREIGN AGENTS:

ADELAIDE: Messrs. Atkinson & Co., Gresham Street.	MELBOURNE: The Mining & Engineering Review, 90, William Street; Gordon & Gotch, Queen Street.
AUCKLAND, N.Z.: Gordon & Gotch, Albert Street; The Mining and Engineering Review, 31a, Strand Arcade, Queen Street.	MILAN: Fratelli Treves.
BELLSBANE: Gordon & Gotch, Queen St.	NEW YORK: D. Van Nostrand, 25, Park Place.
CHRISTCHURCH, N.Z.: Gordon and Gotch, Manchester Street.	PARIS: Boyvean & Chevillet, 22, Rue de la Banque.
DUNEDIN, N.Z.: Gordon & Gotch, Princes Street.	PERTH, W.A.: Gordon & Gotch, William Street.
JOHANNESBURG, CAPE TOWN, BLOEMFONTEIN, DURBAN, PORT ELIZABETH, &c.: Central News Agency, Ltd.	ROUEN: Loescher & Co., Corso Umberto 1° 307.
LAUNCESTON: Gordon & Gotch, Cemetery Street.	SYDNEY: The Mining & Engineering Review, 273, George Street; Gordon & Gotch, Pitt Street.
	TORONTO, ONT.: Wm. Dawson & Sons, Ltd., Manning Chambers; Gordon & Gotch, 132, Bay Street.
	WELLINGTON, N.Z.: Gordon & Gotch, Cuba Street.

Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, and crossed "London City and Midland Bank, Newgate Street Branch."

THE "ELECTRICAL REVIEW'S"

ELECTRICAL & ALLIED TRADES DIRECTORY (THE RED BOOK),

1917 EDITION.

H. ALABASTER, GATEHOUSE & KEMPE,
4, Ludgate Hill, London, E.C. 4.

THE SPIRIT OF THIS CHRISTMAS.

For the fourth successive year we approach the Christmas festival of Peace and Goodwill with practically the whole world at war. The anticipations of a year ago that by Christmas, 1917, the Christian peoples would be able to celebrate one of the central occasions of their Common Religion in former happiness and content, though subdued the while by hallowed memories of our glorious dead, have not been realised. Victories for the high cause of Freedom and Righteousness have not been wanting, but though the spirit of our race still determines that ultimately the principles for which we fight shall be observed, the crowning victory of all has yet to be won. Along that rugged, bloody, climbing way, and that alone, shall we win the era of Peace and Goodwill for which all the world is now longing and waiting. God grant that soon by the wisdom of sane and experienced statesmanship, by the valour of the Allied Arms, and by the true appreciation in the mind of the people of Germany of the Allied aims, there may be caused to find expression among our enemies the broken spirit of repentance, and the desire to make amends for all the cruel wrong of these terrible years. We may utter such sentiments at the season of the cradled Babe of Bethlehem, of the Holly and the Mistletoe, of Santa Claus, and of renewal of family relationships around a bright fireside, without any sign of weakening of purpose. Sacrifices proudly made, losses bravely born, anxieties manifold but recognised as inevitable, will all have their poignancy and bitterness accentuated as the sweet memories of former Yule-tides cast passingly their spell upon the mind. Such reflections may be indulged in here just long enough for us to utter a word of cheer and encouragement for all of our readers who though brave in heart mingle their laughter with tears. Our Roll of Honour has shown that many who in their earlier days followed electrical pursuits, have made for our Cause the supreme sacrifice, and innumerable others near and dear to readers of these pages, but not directly concerned in electrical life, have "Climbed the Steep Ascent." To such readers, may we be permitted to whisper that these have not died in vain. For them, at least, the Victory has been won. Nobly they played their part in the great world tragedy, and gave a priceless offering to the New Era which we profoundly believe our children will enjoy. Let us be proud that we, with them, have been allowed to pay the price as they have paved the pathway of Freedom with their all.

To those others among our readers who, having passed through the Fire, have returned to home or hospital, no longer fit for active service, but bearing in either mind or body, or in both, marks which will long remain as evidences of duty faithfully done, and to all who, tired with the unceasing work of munition manufacturing, welcome the respite of a few days of rest, we can appropriately repeat the old wish: "A Merry Christmas!" To other readers still in the thick of the fight on many a battlefield; to those on the wintry deep, infested with the pests of evildoers who design to sink at

sight, because, forsooth, they clamour for what they call the Freedom of the Seas; to those who on the wings of flight seek out the enemy or act as our protectors—our hearts go out in fullness of cheer, thankfulness, and sympathy, and we join with them in the hope, so often expressed in their optimistic letters to us, that it may not be long before they come home amid Victory's great rejoicings to take up once again the broken threads of professional and industrial electrical life.

The outlook may not seem to us at home so encouraging as we desire. The realisation of our fond anticipations has not been attained by the Christmas of 1917, and there may be still "a long way to go," but—next Christmas!—we will hope and pray that we may all be at the bench, the power station, and the office again, eagerly co-operating in handling in practice the problems that we have so often discussed in theory—the problems of After-the-War.

"Super" Electricity Supply.

THE report of a Sub-Committee of the Ministry of Reconstruction on the Conservation of Coal, of which we give a summary elsewhere in this issue, is of the first importance to the electricity supply industry. How far it coincides with or overlaps the work of the Board of Trade Committee on Electricity Supply, whose report has not yet seen the light of publicity, we cannot tell, but it is not without significance that some of the members are common to both bodies, and we strongly suspect that the document before us contains very much the same substance as that part of the other which covers the same ground. In any event, it is a noteworthy pronouncement, and while, in the absence of details—for the complete report has not been issued at the time of writing—we are not in a position to discuss its contents at length, there is nevertheless ample material for comment in the recommendations now put forward.

Briefly, the report contemplates the division of the country into 16 districts, each supplied with the whole of its electricity from large "super-power plants," and each under the control of a single authority (as regards generation and primary distribution); the generating stations are to be situated on important waterways, with sites providing for by-product plant and electrochemical works; when these are ready, extensions of local uneconomical stations are to cease, and power will be derived from the main systems; and the appointment of a Board of Electricity Commissioners is recommended, with full powers to deal with the whole question throughout the country. The duties of the Board will include the restriction of uneconomical extensions, the arrangement of equitable terms for the transfer of generating and main distributing systems to the local bodies, standardisation of primary frequency and voltage, and the settlement of the method of control in each area. The last item is pregnant with meaning. "A Parliamentary company working under adequate control as regards limitation of dividends, &c.," is mentioned, together with "other alternatives" which are significantly relegated to an Appendix (which is not before us); in addition, the Sub-Committee is "impressed with the special need for initiative and resource in the management," and says that "the freedom of range and keenness which are distinctive of private enterprise will be found to be in a high degree conducive to the fullest measure of success." It is quite clear, therefore, that the Sub-Committee favours the controlled-company system, though the door is doubtless left open—in the Appendix—for municipal or communistic ownership and management, a system which will certainly be

demanded in some areas. Lastly, it is admitted that in order to get immediate results in the shape of a cheap and efficient power supply, "State assistance in some form may be necessary," as to which we would only say—for "may" read "will." Further particulars of the Sub-Committee's plans—for they appear to be such rather than mere theories—will be awaited with the keenest interest.

Swiss Railways and Electric Traction.

ONE of the economic problems which are engaging increasing attention in Switzerland at the present time relates to the conversion of the steam railways to electric traction. This particular question belongs to those which have become accentuated by the war, and the necessity has arisen for securing economic independence, as far as possible, from supplies of foreign coal in face of the fact that the country merely possesses insignificant and undeveloped natural resources in coal. So far the use of electric traction on the normal gauge railways has been of an extremely limited character. At present, only the Berne-Lötschberg-Simplon and the Burgdorf-Thun lines out of the total mileage of standard network are electrically operated, although the transformation of the St. Gothard Railway has been in hand for some time past. The Federal Railway Administration is now also occupied with a scheme for converting the Scherzigen-Berne and the Brieg-Sitten lines, at an estimated outlay of £388,000, but the desire for further development goes considerably beyond this stage.

The conditions of the war, however, render it very difficult to carry out any large scheme of expansion. Apart from the wish to ensure economy in the consumption of coal, other materials are costly and not easily obtainable, labour is dear, and other obstacles stand in the way. It is, nevertheless, considered that the interests of Switzerland in this matter are so great that the country will be able to overcome the difficulties, although the completion of the work will presumably fall in a period of peace, when the special incentive to an accelerated conversion will no longer exist. The Federal Committee of inquiry, which investigated the subject a few years ago, reached the conclusion that the economy of electric traction is beyond question. In this connection, interested circles now hold that, despite war-time prices, the expenditure on railway transformation during the hostilities would not be so considerable as seriously to prejudice the economy in working which is expected from the change. Some of the water powers required for the purpose have already been acquired by the Federal authorities, and others are under negotiation. In the case of the St. Gothard Railway, the necessary powers have been assured near Goeschenen, Amsteg, and on the Ritorn Lake, but about 500,000 h.p. would be needed for a comprehensive scheme for all the Federal railways; and it is calculated that about 60,000,000 h.p.-hours per annum on the turbine shafts would be required to deal with the increased traffic which would result from the transformation of all the lines.

The financial question is naturally of great importance. It is proposed to raise the money by the issue of bonds, of which considerable numbers will be offered for subscription as occasion may arise. Some idea of the expenditure which will be necessary may be gathered from the fact that the conversion of the St. Gothard Railway alone will involve an outlay of £2,480,000. In the case of the private railways, the question of further conversions is still more difficult than in that of the Federal Railways, as the former are not apparently in a position to raise fresh capital, and it is, therefore, possible that they will seek the financial support of the Cantons and the Federal Council for this purpose.

COMMON SENSE IN ADVERTISING.

By A. J. HOUGH.

THE "hot air" merchants of the world are busy. Matters of vital importance—which will one day have to be dealt with honestly and faithfully—are in some instances becoming so inextricably involved and complicated by masses of contradictory evidence and argument, that the real points at issue are lost in seas of mendacity and sophistry.

In the realm of publicity one can sometimes discern a tendency to bury fundamental truths and commonsense beneath a veneer of grandiloquence and high-sounding phrases. Let us be certain that we do not allow ourselves to become—even to a slight extent—"intoxicated by the exuberance of our own verbosity."

We read and hear much to-day of scientific management, efficiency, and psychology in advertising. Strictly speaking, common sense is necessarily embodied in the practice of these arts. Some of our enthusiasts, however, appear to be obsessed by the idea that the only real evidence of scientific management is the existence of a profusion of charts, card indexes, and printed forms of every description. Even assuming that the last ounce of assistance is squeezed from these admirable business aids, common sense cannot be entirely relegated to the background. Inanimate paper and cardboard, and the strict observance of certain rules and formulae, while conducive to efficiency and success in many directions, are at the best but poor substitutes for the rapid, shrewd, decisive reasoning of intelligence and commonsense. So with abstruse and academic discussions regarding the psychology of advertising. Scientific management, efficiency, and the study of psychology are excellent things in their way, but the glib reiteration of these phrases by pseudo-business experts is not proof that they possess an unfailing panacea for business ills of every description. Common sense remains, perhaps, the most valuable asset which can be possessed by the average business man.

Reading some of the effusions which are written on the subject, one might get the impression that psychology is a kind of occult mystery, and that familiarity with its closely guarded secrets is the only open sesame to success in advertising. It would, perhaps, be more correct and practical to say that psychology, in relation to publicity, is the application of certain ascertained facts and principles in a manner which our accumulated knowledge and experience has shown to be most effective.

It is axiomatic, though somewhat trite, that successful advertising depends to a great extent upon the media selected, the nature of the proposition, and the form in which such proposition is presented. Advertising to sell goods is—to use a familiar analogy—merely salesmanship in black and white.

Some people have a hazy idea that they need only spend a sufficient sum on advertising in order to achieve immediate success. This is not the case. Unless every effort is directed into its proper channel, and the work carried through effectively and with shrewd discrimination, there will be disillusionment and loss.

One of the chief points to be remembered is that every advertisement, immediately it is printed, must enter into antagonistic rivalry with other advertisements in the same paper. This is especially true when small spaces are used. It is not necessary, as some assert, that your advertisement should "kill the man next door." The copy should, however, possess distinctive attention-compelling qualities of the highest degree. Its general form and display should be such as will arrest the eye. Its arguments must be forcible, concise, and convincing.

These conditions probably receive due consideration from the majority of advertisers. There is, however, another aspect which is not so frequently borne in mind. While every endeavour should be used to make the advertisement distinctive, it must not be assumed that it is a good one just because it is conspicuous. There is a vast difference between an advertisement which will bring business and one which will merely attract attention.

Then there is what is sometimes called reminder advertising. How often do we see—especially in the small

provincial papers—fairly large spaces filled with what might be termed memorial cards of the business. This, in most cases, is absolute waste. Such space should be filled with live selling talk, frequently changed. Interesting news and information regarding the goods should be given. A paper which printed the same articles day after day and month after month would not be read. So with an advertisement which is never changed. To spend money on reminder advertising means continual paying out with little prospect of return. If an advertiser can find nothing better to say than the fact that his name is so and so, and his business so and so, it will pay him to get someone to fill his space for him without delay.

Getting results by general publicity is a long and costly operation. Keeping your name before the public is not bad policy when the article can be purchased at any street corner. In spite, however, of all the platitudes we hear from time to time regarding "future investment" and "cumulative effect," there is nothing that can beat immediate results. The quicker advertising expenditure can be recovered, the sooner can the amount be laid out again. Think this out, and decide what you want—whether you wish to have the complacent satisfaction of seeing your name and the nature of your business announced from time to time, or whether you wish to sell the goods. Business or notoriety! A sufficient expenditure in the Press will give you either.

Other copy can frequently be seen which is cleverly written and charming to read, but not convincing. Catchy cleverness sometimes withdraws attention from the goods. Vague generalities—however choice and flowery the language employed—are of little use. Facts and definiteness, in plain and simple words, are more effective. For instance, in literature designed to sell an ordinary wheelbarrow, the words "thoroughly seasoned ash" mean more than "best selected material." Again, "tested to stand a dead weight of 10 cwt." is of more value than "the strongest barrow made." Specific facts are always better than general statements. This is especially true when the article advertised is one which appeals to business men—as distinct from the general public.

The hints which follow, while perhaps they will convey little that is new to the experienced advertiser, may prove useful to some of those whose opportunities for studying the subject are somewhat limited.

Size of Space.—One often hears arguments regarding the most effective size of space. This depends upon a variety of circumstances. There are occasions, however, when the size of the space which is used has really less to do with getting results than the use which is made of the space. Large size in an advertisement, while possessing many advantages, is not by any means the chief desideratum for success.

Headlines.—An attention-arresting headline can be made of great value, especially when it serves as a context to the advertisement, and is developed by the illustration and copy. The headline should be a guide post to the body matter. It should not be too general, nor should it be deceptive. Copy which may otherwise be good in every respect will have little, if any, influence upon people whose attention has been attracted under false pretences.

Illustrations.—Illustrations should be used with a distinct purpose in view. It is not sufficient that they should arrest the attention and stop at that. They should form an integral part of the complete advertisement, and help to tell the story. It is possible to have a picture—in no way related to the goods advertised—which will attract attention because it is in some way novel or bizarre. Such illustrations, however, rarely add anything to the selling qualities of the advertisement. On the other hand, they frequently detract from its pulling power by monopolising attention which might otherwise be given to the copy.

Copy.—When preparing copy, be sparing in the use of italics, and do not have too many lines or words heavily displayed or emphasised in any way. The only result will be that they will work against each other in clamorous competition, and detract from the appeal of the whole. Do not permit overcrowding. An advertisement which is overcrowded is unpleasing in every way, and seldom invites perusal. Someone has said that advertising is picture

painting in words. See that your picture tells the story in a simple, sincere, and convincing manner. Do not use too many styles of type. One style in different sizes, or a few styles artistically related, are best.

Posters.—Posters should, in most instances, serve to fix firmly upon the mind impressions that have already been created, or are being created, by other advertising. While much can sometimes be accomplished by posters alone, they should, speaking generally, be strongly supported by other forms of publicity. Quite as much depends upon the selection of sites as upon the posters themselves. Although little detailed description can be attempted in a poster, the applicability of the goods advertised can sometimes be suggested in a very effective manner.

Handbills.—If handbills are used, they should be of good quality, and be distributed with careful discrimination. 1,000 well-printed pamphlets, enveloped and addressed to selected recipients, will bring more business than 10,000 of poor quality distributed in a haphazard manner.

Distribution of Literature.—Merely to compile a list of names from directories and other sources is not sufficient. The index should be built up carefully and methodically. Some important and far-seeing firms (whose belief in thoroughness has been justified by results) have found it a paying proposition to secure the collaboration of their outside staffs for this purpose. A card is filed in for every firm called upon—if possible, when the first call is made. When received at the head office, the cards for prospective customers are filed in the "live" index. Cards for firms not likely to be of use are marked "Useless," and filed in the "dead" index. The reason why the firm is considered "useless" is always stated on the "dead" card. As both indexes are referred to before a new card is filed, there is no possibility of useless or duplicate names being added to the "live" index. Each card gives particulars regarding the exact nature of the business carried on, the approximate number of hands employed, the goods manufactured by the advertisers which are likely to be required, the name of the person to whom advertising literature should be addressed (if this is allowed), and other information. The cards are filed alphabetically in order of name. They are graded and marked G1, G2, G3, G4, G5, or G6, according to the nature and importance of the business. A capital letter indicates the branch office or district to which the firm belongs—thus "L" denotes London district and "M" Manchester district. Other numbers (written in red and commencing at 10) show the trades classification—i.e., 12 may comprise all engineering trades and 14 all textile trades. With such a system (suitably adapted to meet particular requirements) literature can readily be addressed by young girls to all the firms on the index—to firms likely to be in the market for some particular article—to firms of any selected grades—to any particular trade or class of trades—to the most important or least important of any particular trade or class of trades—to all or any selected grades or trades in any particular district. If neatness and legibility are particularly desired, the letters and figures can be stamped on the cards by rubber stamps. Although full working details of the system cannot be given here, it will be readily appreciated that the adoption of such a scheme gives opportunities for intensive advertising with a minimum of waste. There is no comparison between the results obtained from literature dispatched blindly from a list and that which is guided into the proper hands with intelligence and discrimination.

To sum up, theories upon what may or may not constitute a good advertisement from the critic's point of view are worth careful consideration, but what are wanted for the general mass of people are good, hard, telling, convincing and persuasive facts. Information should be given in plain, straightforward language, without ambiguity or exaggeration. All complex tangle that cannot be easily understood should be strictly avoided. If the article, price, and methods of distribution are right, good advertising will bring results. It is worth while remembering that humanity in the aggregate to some extent resembles sheep and monkeys. Like sheep, they can be driven in flocks, and, like monkeys, they will imitate what they see their neighbours do. Whole neighbourhoods, for instance, will sometimes adopt some special contrivance or article because

some person of importance orders the first one. Certain articles will sometimes become the "fad," and the "fad" ultimately becomes general. A keen judge of human nature can sometimes foresee this result when placing an article upon the market. Unconsciously, it may be, he is a student of psychology.

Successful advertising necessarily involves successful merchandising, and means more than the ability to write interesting advertisements. The goods must be readily obtainable, either direct from the makers or through dealers. If the latter, economical methods of distribution must be arranged.

INSURANCE OF ELECTRICAL MACHINERY.

By C. STUART BUYERS, A.M.I.E.E.

ONE of the results consequent upon the widespread use of electric power has been the formation of electrical departments by many insurance companies whose engineering activities previously were confined to the insurance and inspection of boilers and steam engines.

It may confidently be stated that the number of electric machines insured in this country at the present time exceeds 100,000. These are of all sizes and types, from the diminutive fan motor to the large rolling mill motor or turbo-generator set.

Insurance is the watchword of the twentieth century, and electrical engineers cannot complain that their particular interests have been in any way neglected, there being quite a number of enterprising insurance companies ready to meet any demand which may arise in this direction.

As the usual methods adopted in carrying out the insurance of electric plant may not be generally familiar, the writer proposes to explain on broad lines the underlying principles connected with this rapidly growing business.

On being approached by an insurance agent to consider the question of insuring his electric generators and motors against risk of loss or damage from breakdown, the proprietor or manager of a firm which has adopted electric driving of machinery naturally asks, first of all, what it will cost.

Curiously enough, the premium is charged on what appears at first sight to engineers to be a very unscientific basis. The agent simply requires to ascertain the rated kilowatt output of each generator and the horse-power of each motor, and from this data he is able to submit an estimate of the annual premium and the sum for which each machine will be insured. No details, such as voltage, speed, nature of drive, whether continuous or alternating current are required in the first instance, as the premium is based on the output alone.

The thought arises at once, that surely if this is the case, the owner of a low-tension or low-speed plant must be penalised to the benefit of the owner of a high-tension or high-speed installation. Practice proves, however, that such reasoning is fallacious; in fact, high-tension electrical machinery is a better insurance risk than low-tension, for two reasons—firstly, because the manufacturer pays greater relative attention to the insulating materials used and lengths of creepage paths allowed; and, secondly, because the fact that a machine is operated by high-tension current ensures that it will be properly installed and maintained by the user.

The premium is based on a sliding scale, which has the effect of diminishing the ratio of premium/indemnity as the size, or, to be more strictly accurate, the value of the machine increases. This is sound finance, as the cost of inspection and management is practically independent of the size of the insured item, and remains constant, the risk being the only variable.

Should the agent prove successful in having his quotation accepted, the next step taken is to have the plant carefully inspected by an electrical engineer-surveyor whose business it is to take full details and to report to his employers the condition of the plant, making special note of any circumstances likely to lead to breakdown. If the

surveyor's report is satisfactory on the whole, the policy of insurance is issued, and a detailed report on the condition of the plant, stating any suggested improvements, is sent to the owners. On the other hand, if any serious defects are noticed, such as heavy overloading or the working of open-type motors in exposed, and wet situations, &c., the policy will be deferred until the working conditions have been made satisfactory.

In extreme cases where, due to lack of attention or to adverse conditions of working, the plant is subject to frequent breakdown, the majority of insurance companies will decline to accept the risk.

Experience fully proves that in electrical machinery it is not the design or manufacture of a motor that determines the breakdown risk, but the conditions of working.

The report of a skilful and experienced surveyor is of great value to the possessor of electric machinery, as it enables him to form an accurate estimate of the way the plant is being looked after, and whether suitable steps are being taken to maintain it in efficient condition.

The first inspection is followed by further ones at intervals of about three months, and after each inspection a fresh report is submitted giving details of improvements or defects noticed since the previous examination.

Many insured firms consider the reports to be the most valuable feature connected with their policy, and although they have no breakdowns over a number of years, they continue to insure without any feeling that the amount expended in premiums could have been better utilised.

There is no doubt that a wide-awake surveyor can often prevent a serious breakdown by detecting a hitherto unobserved crack in a casting or by pointing out a defect in the insulation revealed by his portable testing instrument.

On more than one occasion the writer has detected unnoticed faults or flaws in machines working under the supervision of well-trained engineers, and it is without question a fact that fault detecting is largely a matter of experience in breakdown and repair work. A surveyor coming fresh on to a plant is more likely to notice something abnormal than the engineer-in-charge, who usually sees the machines six days a week. This may sound paradoxical, but consider, for example, an oil-cooled transformer. The load on this may have been gradually increasing due to extensions, or the transformer may have been changed to a new and out-of-the-way position with less ventilation. In either case the temperature will rise; and, even if the rise be above safe limits, it is very improbable that a charge-engineer who had been supervising it for a number of years without experiencing the slightest trouble, would notice that the heating was more than it had been previously.

Any excessive heating would, however, at once be noticed by an outside person who had had experience in the working of transformers.

It is not always realised that inspection is carried out solely with a view to prevent breakdowns and to assist the owners to maintain their plant in such efficient condition that the number of breakdowns or accidents will be reduced to the lowest limits.

When a firm allows its electric installation to get into a neglected and unreliable condition, and then insures it against breakdown, it may take the insurance company several years to have patched-up armatures gradually re-wound as they burn out, and to get the owners to alter unsuitable drives, thus turning a bad risk into a good one.

An actual case to illustrate this may prove of interest. A firm of engineers decided to insure their electric motors, numbering some 65, six years ago. This D.C. plant, with motors varying in size from 5 H.P. to 50 H.P., when taken over by the insurance company was considered a doubtful risk, as the motors were of an old type, and they had been frequently repaired in a temporary manner in order to keep them working.

The breakdown experience proved to be as follows:—

1st Year	12 motors broke down.
2nd "	13 motors broke down.
3rd "	11 motors broke down.
4th "	11 motors broke down.
5th "	9 motors broke down.
6th "	5 motors broke down.

During the first three years it was found necessary to

rewind a number of armatures, and the risk was an unremunerative one, but the second three years, in spite of severe work imposed by war conditions, showed a considerable reduction in the amount paid in claims, and it may safely be stated that the plant is in better condition to-day than it was six years ago.

(To be concluded).

THE GOVERNMENT AND FOREIGN TRADE.

THE fascinating history of the birth, growth, and development of British foreign trade contains much to make us proud of the initiative and foresight, daring and enterprise, of our forbears. The pioneering achievements of very early trading days will never lose their romantic character. There was nothing of the ugly spirit of modern methods of penetration, for there were no competitors of any kind. Even down to five and twenty years ago we were able to carry on large transactions practically without let or hindrance in various markets of the world. International trading rivalry was then only a mild and more or less friendly thing compared to what it became—first gradually and then ever-increasingly—in the following years, as other nations developed their manufacturing resources and became envious of our reputation and our success. The efforts of large trading concerns and the enterprise and initiative of private commercial firms secured a great name for British manufactures and for the rectitude of British commerce and commercial men. We knew how our reputation had been established, and securing abundant trade, we were too content, and left the way open for those who designed to weaken our hold, and who introduced all sorts of enemy methods, some skilful and efficient, others mean and base, to that end. The story of their success is well known to traders to-day; three and a-half years of terrible war have brought the facts out into the light of day until even the man in the street knows something of it, though, strangely enough, the lesson has not yet been fully learned by numbers of politicians, judging from the discussion at Westminster on the second reading of the Non-Ferrous Metals Bill.

The foreign trading situation has undergone an entire change since those romantic early days, and while no one can say to-day what developments may take place therein consequent upon the terms of Peace and our new commercial relations with allied peoples, it is perfectly obvious that isolated and individual efforts will be at a great disadvantage for ever hereafter. It is also equally obvious to most of us by now, that while Government control of certain trades must continue for several years there must be Government encouragement of trade too. No coming Government will be able to exist for long unless it sets its face fixedly against obstructing industry and commerce, and abandons anything in the nature of a policy of apathy toward trade and traders. Lessons learned in the tribulation of warfare have to be carried into very definite practical policy, encouraging those who aim at developing our international trade, and bringing to British factories unlimited work for British workers.

Whatever may be the designs of present enemies for after the war—designs which we have it in our power seriously to check by reason of the Allied control of raw material, and the other advantages accruing to us from our Empire resources and from present Allied relationships—we shall require all the assistance that Governments can legitimately render, in order that our position may be secured against such attacks as the disclosures of recent years reveal. Manufacturers and traders will need to bring up their own efforts, individual and collective, to the highest possible pitch of perfection, and we believe that by the employment of scientific method in organisation and production, they will succeed, if they can secure reasonable and intelligent co-operation from the workers, whose prosperity is linked up with their own. But the co-operation of the Government is as essential as is that of the workers, and we are glad to welcome the signs that those now at the helm intend that it shall be given, and given effectively.

The need for Governmental encouragement of trade

is no new theme in these pages. We have offered our criticisms of its obstructive policies in the past, and when we have observed indications of the desire to do well, we have not omitted to say so. Therefore, to-day we welcome quite heartily the measures that are being developed by the new Joint Trade Intelligence Department of the Foreign Office and the Board of Trade for co-operating with the manufacturers and traders of the kingdom. Sir Arthur Steel Maitland, M.P., the Head of the new Department, has in hand a task of the utmost difficulty in evolving something like decent order out of chaos. Infinitely easier would he have found it if he had been instructed to start an entirely new Department for fostering British Trade abroad; but the circumstances preclude any such simple operation. What he has to do is to piece together parts of several departments, and the measure of his success in building up a strong and effective organisation will be the measure of goodwill displayed by those departments. The new Department includes the Commercial Department of the Board of Trade, which, useful as it has been within its limited capacity in the past, may be made a far greater help, and the War Trade Intelligence Department of the Foreign Office will also form a most important section of the new organisation. The operations of the War Trade Department in connection with war-time problems have been larger and more effective than is generally understood. It has had much to do with economic questions which will be of the utmost importance in connection with Peace negotiations and our general proceedings after the war. Then those who have been dealing during more than three years with the Lists of Enemy Firms here and all over the world will not have completed their work when the war ends, for the weeding out of enemy concerns must be followed with a constructive policy of facilitating the introduction of friendly in place of enemy businesses. Therefore, we shall be bringing together, as soon as it can be arranged, the Commercial Intelligence Branch of the B. of T., the War Trade Intelligence Department (though obviously its war work, being still incomplete, it cannot be transferred at once), the Foreign Trade Department of the Foreign Office, and the Consular Service and Consular Department of the Foreign Office. There will be two sections of the New Department:—(1) The Overseas Division organised in geographical sub-sections; (2) the United Kingdom Division sub-divided according to trades and industry.

It is hoped that by means of thorough co-operation between all concerned, co-operation which will in due course be facilitated by greater convenience in respect of departmental housing, any piece of business or information that can be turned to good account by British finance and industry will be taken full advantage of, and will redound to the common good. An efficient Advisory Committee will be set up consisting of live and experienced men from the worlds of finance, manufacturing, commerce, labour, and so forth, and a special effort is to be made to secure the distribution of information among the industries at Home and to ensure publicity in foreign countries respecting British manufacturing and trade.

There has been some feeling exhibited by merchants who are fearful that the new Department has designs for their elimination. These fears originated from the urgent appeals that were made to manufacturers to organise themselves into co-operative bodies so as to secure better results abroad. We have recently referred to this subject in some detail. Sir A. Steel Maitland sees well enough that after the war Germany will be out to do a great thing in the matter of penetration, and while we do not want to adopt the same method, we must meet it somehow, and we can only do so by co-operation amongst ourselves. He holds, as we do, that export associations in industry are desirable, but that such action would not eliminate the merchant. Of course, we cannot eliminate the merchant if we could, and, as a matter of fact, we would not if we could, for he has a most important place to fill in economic activity; but the lessons of the past are not easily forgotten, and if we learn one thing more than another from those who study the course of British and foreign trade competition, it is that co-operation between our manufacturers is absolutely essential on many grounds: if we are going to retain, to regain, and hold much of our former trade, and to develop additional business. Adaptability is a matter of

first importance in meeting the needs of foreign customers, and our adaptability will be facilitated by a policy of co-operation amongst our manufacturers. But why cannot the merchant enter into the co-operative group? Why should he suspect those who desire to strengthen our industries of seeking to work out his elimination?

(To be concluded.)

THE METRIC SYSTEM.

It was hoped that the discussion which took place at the INSTITUTION OF ELECTRICAL ENGINEERS on Thursday, last week, would strike a new note, and prove of direct assistance towards bringing the subject into concrete form, by dealing with it from the practical workshop point of view. Unfortunately hopes were not realised: the debate was certainly interesting, and at times entertaining, but with few exceptions speakers confined their remarks to the merits of the rival systems, and while the trend of opinion was unquestionably in favour of the adoption of the metric system, but little information was gained as to the difficulties to be anticipated and the methods by which they might be overcome. The same applies to the two short papers which prefaced the opening of the discussion; both were of undoubted merit, but both covered ground which has been pretty well beaten in the past, and consisted very largely of descriptive material. On the whole, therefore, the meeting did not carry the matter much further than before, and for that reason we look upon it as somewhat disappointing. On the other hand, too much should not be expected of a discussion of this type, lasting some two hours and necessarily conducted on haphazard lines. Apparently no progress can be hoped for without a properly constituted commission of inquiry, before which each witness will be examined in an orderly fashion, and will be subject to cross-examination. The great importance of the question fully justifies the initiation of such an inquiry, we do not say "even in war time," but more particularly and precisely because we are at war, and now is the time to arrive at a decision in the matter, in readiness for prompt and effective action the moment the conditions permit of it.

MR. LL. B. ATKINSON, in his paper entitled "The 'Pros and Cons' of the Metric System," endeavoured to define clearly the real issues that formed the subject-matter of the discussion which has been in progress for 30 years, and offered some suggestions towards reconciling conflicting views, while treating the question impartially. The author, however, at the outset expressed his preference for a decimal system of coinage, and the metric system of weights and measures as the legal standards for the Empire. He had often been surprised at the lack of definite ideas on the subject in the minds of authorities on this question, and for clearness he divided the points at issue under three heads—the question of decimalisation of moneys, weights, and measures; the question of the actual magnitudes involved; and the question of policy. He then detailed and discussed the three systems—British, metric, and C.G.S.—which he regarded as relevant, laying stress on the fact that in the British system there was no standard of mass, and that the British tables were based almost entirely upon the use of 2 or powers of 2 as multipliers, whilst the other two systems proceeded by multiples of 10. While the decimal system was essential to the use of calculating machines, slide rules, &c., he thought that the great majority of the population did not employ such aids, and were unable to use decimals in calculations. Referring to the magnitudes of units, he had no doubt that the pound and the half-kilo weight were best suited for the mass of the population, and the ton and hundredweight or 50 kg. for wholesale purposes. The foot and centimetre were useful units; the $\frac{1}{16}$ th inch and the mil were better than the millimetre and $\frac{1}{10}$ th mm. He thought the direct relation between the metric units of mass and volume of little practical value, but concluded that as regarded the magnitudes of units, the advantages of the rival systems were fairly balanced. On the question of policy, Mr. Atkinson considered that the vast bulk of the people had no direct interest in international trading, which concerned

only the merchants and engineers, and said there was a widespread feeling that the moment was inopportune for adopting the metric system. He thought there would be little difficulty in decimalising the coinage, but preferred the florin to the pound as the ruling coin of account. With regard to the unit of weight, he advocated the adoption of a new pound equal to half a kilogram, which would enable existing multiples of a pound to be retained almost unaltered, until they fell out of use. If the gallon were made equal to 10 of the new pounds it would be of 5 litres capacity, and the way would be clear for the eventual adoption of the metric units of volume, by which time the metric units of length would have become largely used. Mr. Atkinson concluded in favour of the adoption of decimalised currency, the new pound and gallon, and an educational campaign leading up to the compulsory use of a complete decimalised system—the metric system of weights and measures—a programme which might be realised in ten years.

MR. A. J. STUBBS read a paper entitled "A Case for the Adoption of the Metric System (and Decimal Coinage) by Great Britain," in which he outlined the history and described the constitution of the metric system, comparing it with the "chaos which we call our system," very greatly to the disadvantage of the latter. Referring to proposals to modify the British units without adopting the metric system, he held that the only practical way of mending our present system was to end it, and proceeded to illustrate the advantages of the metric system derived from its scientific basis, the simplification of calculations and the dimensions of drawings, the applicability of the decimal calculator, economy of time in education, and uniformity of international and other relations. The author then dealt with the disadvantages entailed by a change of system, referring to the extended use of English conventional standards of size, tonnage, &c., the cost of the change, which he regarded as exaggerated in importance and in many cases fanciful, the loss of mental and manual facility bound up with existing practice, the correction of drawings, the scales of maps, &c. Admitting that there would be appreciable inconvenience to the community during the transitional stage, Mr. Stubbs held that it would be felt less in the immediate future than at any later period, because our ordinary standards had been upset by the war, and great numbers of men returning from France would be familiar with the French units. The voluntary adoption of the metric system had been proved to be impracticable; compulsory measures were essential. He concluded with the suggestion that the loss of time and waste of money involved by delay should be curtailed by putting the change in hand at once.

DISCUSSION.

The PRESIDENT, in the course of a few remarks, pointed out that they had to consider whether the electrical industry would benefit, or the reverse, by adopting the system. It was argued that it would facilitate export business with metric countries, and if this argument were sound, it was equally true that it would facilitate the business of such countries in our markets which used British measures. He thought that only manufacturers who were in touch with the question could decide this matter. The Institution must make up its mind and decide one way or the other; the system would never be voluntarily adopted, and therefore compulsion would be necessary.

MR. HARRY ALCOCK, who opened the discussion, said he heartily agreed with the general findings of Mr. Stubbs's paper; as to Mr. Atkinson's contribution, he regarded it more in sorrow than in anger. Mr. Atkinson talked about dismissing all fanciful considerations, and then proceeded to invent hundreds of them. He (the speaker) advocated a universal system, as a nation could only survive by its trade with other nations, and we must make it easy for others to deal with us. He did not accept the inference of Mr. Atkinson that the export trade interested a small number of people; we were all interested, and it was a national duty to widen our industrial connections. Which system was to be the universal one? The British system was hopeless, and we must either consider its improvement or adopt a better one. He pointed out that a House of Commons Committee in 1870, after considering the above matter, came to the conclusion that it would be as difficult to adapt our own system as to adopt a new one, and our trade at that time was nothing compared to our present trade. Our manufacturers considered their own convenience, not the national advantage, and this accounted for the passive attitude of the manufacturer. He

reminded them that in 1870 the Germans adopted the metric system used by the French, who were their opponents, because of its advantages. It was probable that there would be a period of reorganisation after the war, when the metric system could be adopted.

MR. W. H. MASSIE said he was born, and lived for 30 years, in a country where the metric system was in use, and then came to England, and for 13 years had to learn English measures. He subsequently returned to a metrical country for two years, and, although he agreed that the metric system was simple, he, personally, had a preference for the English measure which he used. No doubt the metric system was preferred by the scientist, but it did not affect an ordinary workman like him. However, he was absolutely neutral in his attitude.

Commander BOWEN, F.N., expressed his appreciation of the papers, which dealt with the question from different points of view. The question of policy in education was most important; he had often pitied the young Briton who found a difficulty in remembering so many figures, and had to use a ready reckoner. Decimalisation and "metricalisation" were totally different; if the British system could be decimalised it would probably be better to use such a system, but it had been shown that this would probably be as difficult as adopting the metric system. He urged that it was the business of the technical man to lead the practical man, whose business interests were limited to his own affairs.

Major PLAISANT said that he was in this country last year to purchase enormous quantities of wire, &c., and had to translate the schedule into British weights and measures; he believed that we might have saved a year of war if the metric system had been in use here. At Peking, with the Boxer Expedition, he was at the entrance of the Imperial Palace, and witnessed a conversation between his Chinese attendant and a Japanese sentry; neither understood the dialect of the other, but they had no difficulty in communicating with one another in writing. In the same way, the metric system was a universal language, and would facilitate intercourse between the nations, whereas the British system formed a kind of veil between the French and British. Even in a savage country he had found the decimal system in use and understood by the natives. He compared the existing conditions with the confusion of tongues at the building of the Tower of Babel, and illustrated the difficulties due to the difference of units. If our soldiers had known the metric system, much loss of time might have been avoided.

MR. ROGER SMITH said Mr. Atkinson very properly referred to the effect of the change on the 90 per cent. of people who calculated mentally. The mechanical engineer would welcome the change. The French had had some 77 years of compulsory use of the metric system, yet in the provinces they were still able to use their old weights, &c., adapted to the new system, and he felt sure that the English would also be able to do so.

Commander BRISTOW pointed out that the magneto industry had been founded during the war under the aegis of the Government, and all dimensions were standardised in millimetres; some 300,000 magnetos had been made, and the factories might as well be in metric countries as far as drawings and dimensions were concerned. In regard to our export trade, statistics showed that 281,000 tons of machinery were sent to English-system countries, and 203,000 tons to metric countries; it might be hazardous to do anything to affect our tonnage to the former unless they would come into line in regard to system. We did twice as much cycle business with English-system countries, and nearly the same proportion in scientific instrument exports. Taking the whole of these exports, the proportion was 800 to English-system countries and 600 to metric countries, so that the trade with the latter was not so preponderant as the number of such countries might suggest. To illustrate the impossibility of remembering the diverse systems of weights and measures in use in this country, he mentioned that an inquiry as to the number of "caraways in a featherweight," made to an official "weights and measures" department had been treated quite seriously.

MR. D. ADAMSON considered that the question of coinage should not have been introduced. The sovereign was not comparable with the inch, yet the decimalisers would retain the former while abandoning the latter older measure. They must guard against discontinuity in work; the change over to the metric system would involve throwing over everything established by Whitworth. The textile machinery industry was unanimously opposed to the metric system, largely because its adoption would affect continuity of output, due to the disorganisation of the supply of new parts to old machinery. Incidentally, he mentioned that the German machinists had adopted a range of only 50 metrical sizes of tools, as against the 150 different sizes which British makers had for the same range of work. It would not be such a small matter to renew all these tools as might be supposed; he doubted whether they would be able to sell cheaper, and thought it would be a mistake to compel people to adopt the metric system.

MR. E. C. BARTON said he thought that Australia would very soon be a metric country; they were only waiting for England to move in the matter. He strongly urged that this was not a case for studying individual interest; they must consider the national interest. Experience showed that

the jewellery trade, although opposed to the metric carat before its adoption, were its supporters immediately after. The Germans had without trouble abandoned their old coinage for metric coinage. The English system was illogical, and confused a man from his school days; he was logical before he went to school.

Mr. H. M. HOBART said he had long felt depressed by the lack of progress in this subject; the conditions were no more encouraging in America than here. It seemed to him that one dare not contemplate what would happen if the metric system was not adopted within 10 years. He had been a believer in that system for many years, but as an engineer was compelled to use the English system, in order to be understood, and for this reason collective effort was necessary to bring about the introduction of the metric system. He did not see any hope of being free from the handicap for the next generation unless they proceeded actively by collective effort. Habit was a predominant factor; not our own, but other's habits. The young men of both England and America were strongly in favour of the metric system, but the old men were the obstacle.

Captain D. H. KENNEDY recalled a discussion on the subject 16 or 17 years ago by the Institution; he considered it a serious reproach that nothing definite had been done as yet. Although he was neutral in his attitude to the metric system before the war, he now felt that the change should be compulsory. It was a remorseless state of mind which would compel our children to adopt the British system just because we used it. The more mental muddle caused to a child the less was the mental energy available for the things that really matter in life.

Mr. H. ROTTENBURG pointed out that the obstacle to change arose from the fact that the older people while in a position to say whether a change should occur, had not the mental suppleness to arrive at a decision on the matter. The younger generation had a right to be consulted. The question was whether the great thinking mass of the people would benefit by the introduction of the metric system. He, the speaker, felt that the transition stage would lead to endless trouble, but if a broad view of the matter were possible, differences of opinion would disappear.

Owing to the brief time at their disposal, the authors decided to communicate their replies to the *Journal*.

NATIONAL ELECTRICITY SUPPLY.

A BOARD OF ELECTRICITY COMMISSIONERS.

AN interim report of the Coal Conservation Sub-Committee of the Ministry of Reconstruction (abstracted in *The Times* of Friday last) deals with the extent to which conservation of coal could effect economy in the production of motive power with the expansion of industry which should result in the way of new manufactures from the proper use of coal so saved, and with the steps necessary to attain these objects. The members of the Sub-Committee were:—Mr. Charles H. Merz, Prof. W. A. Bone, Mr. Guy Calthrop, Mr. John Kemp, Sir R. A. S. Redmayne, and Mr. Charles P. Sparks. It will be remembered that a Board of Trade Committee is also dealing with the problem of electric power supply.

It is pointed out in the report that the coal consumption involved in the production of motive power in the United Kingdom amounts at present to 80,000,000 tons a year. In the industrial reorganisation which must take place on the termination of the war the further development of power is of great importance, and large quantities will be required for the development and carrying on of new processes not at present undertaken in this country. The present use of motive power per employé is only about half that in the United States, and it is only by largely increasing the amount of power used in industry (by two or more times) that the average output per head (and, as a consequence, the wages of the individual) can be increased. The pre-war earning power, or wages, of each individual, was far too low.

Power can be most efficiently applied to industry by the medium of electricity, and, technically and economically, electrical energy can be best provided by a comprehensive system. Power production in large plants, with generating machines of 50,000 h.p. or more, will not only be far more economical than in a large number of smaller plants, but will ultimately involve great economies of capital by securing a better load and a more effective use of the plant. With such super-plants, if suitably situated on large sites, it would be possible—so far as it might be found economical—to extract by-products from the coal before using it as fuel. The super-plants would feed into the main trunk distributing system, which must be laid down throughout the country, and which would collect any waste power available, wherever situated, and deliver it where it could be profitably used. It would also, by saving the cost of transport, make it commercially possible to bring to the surface much coal that is at present wasted and left in the pits, but which, under the new conditions, would be turned into electrical energy at or near the pithead.

Where power supply in the United Kingdom dealt with on a comprehensive basis and advantage taken of the most modern engineering developments, the saving in coal throughout the country would in the near future amount to 55,000,000 tons

annually on the present output of manufactured products, apart from the possible saving on domestic coal consumption. If the coal so saved were used for the production of further power, it would be possible to generate continuously not less than 15,000,000 h.p., which would more than compensate for the absence of large water-powers in this country, and admit of the manufacture here of many products which at present are made only in America and on the Continent.

The Committee regards it as essential that the present inefficient system of over 600 districts should be superseded by a comprehensive system in which Great Britain is divided into some 16 districts, in each of which there should be one authority dealing with all the generation and main distribution. Centres or sites suitable for electric generating purposes should at once be chosen on important waterways as the future main centres of supply for each of these large districts. The sites should be as large as possible, having in view the land available in suitable localities, and should have ample water and transport facilities. Land is required not only for the power stations themselves—which for the sake of security and safety would have to be suitably sub-divided, and not all contained in one building—but also for the processes involved in the extraction of by-products from the coal, where such extraction is found to be justified. It is also required for the development of electrochemical processes, which can be most conveniently carried on close to the power plant. Plans should be prepared for the construction immediately after the war on these sites of the first instalment of these large super-power plants, and once these plants were in existence it would be possible for existing authorities, without being left in the lurch, to stop extensions of their own uneconomical stations, and to arrange to take their power from the main system.

To carry out this policy a Board of Electricity Commissioners should be appointed, with full power to deal with the electricity supply situation throughout the country. Among other things they should have power:—

1. To stop the extension or multiplication of uneconomical stations for public supply.

2. To arrange for the handing over, on equitable terms, of the generation, transmission, and main distribution system in each of the areas into which the country is to be divided to a new electricity body appointed for that area.

3. To standardise for each area the frequency and voltage of the main transmission and distribution system.

4. To settle for each area whether such body should consist of a Parliamentary company working under adequate control as regards limitation of dividends, &c., or of one of other alternatives set out in an appendix to the report.

With regard to these alternative types of electric power organisations, the Sub-Committee is impressed with the special need for initiative and resource in the management of the business of power supply, and is of the opinion that the freedom of range and keenness which are distinctive of private enterprise will be found to be in a high degree conducive to the fullest measure of success. The Sub-Committee considers that if the nation is to get immediately an efficient power supply, and is to take advantage of the temporary lull in manufacturing output immediately after the war, State assistance in some form may be necessary.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

An Institution of Electrical Station Engineers.

In reference to the letter in the *ELECTRICAL REVIEW* of the 30th ult., from the assistant technical officers of the Sunderland Corporation Electricity Department, I have been instructed by this branch to forward you a copy of a letter which has been sent to Mr. Healy, of Battersea, on the subject of the proposed Institution of Electricity Supply Engineers. You are at liberty to insert the same in your next issue should you so desire, and we shall esteem it a favour if you can do so, as we think it deals with a question of urgent importance.

J. W. Thomas.

Hon. Sec., Manchester Branch,

Association of Electrical Station Engineers.

Manchester, December 14th, 1917.

ASSOCIATION OF ELECTRICAL STATION ENGINEERS.

MANCHESTER BRANCH.

H. W. Healy, Esq.,

Battersea Borough Council Electricity Works,
Battersea.

Re The Institution of Electricity Supply Engineers.

Dear Sir,—At a general meeting of the Manchester Branch of the A.E.S.E. the recent correspondence on the proposed Institution of Electricity Supply Engineers was discussed. The members were in entire agreement with the engineers of Sunderland in their expression of sympathy with the aims of the technical officers in London, as indicated at the meeting held in Hammersmith.

There is little doubt that the state of affairs in the provinces is similar to that in London, and, recognising this, we

in the Manchester district are making strenuous efforts to place the question of status, efficiency, &c., on a sounder basis.

Whist certainly welcoming the advent of such a prospective institution, and being anxious to assist in the establishment of such on a national basis, we would suggest that the task of reconstruction be undertaken by means of and through the already existing Association of Electrical Station Engineers. This Association has already a large membership in the provinces; in Manchester and district we have in a short space of time enrolled upwards of 100 engineers holding responsible positions in electrical supply undertakings, and the task of organising would be greatly simplified if its machinery was made use of, and the danger of overlapping organisations would be avoided.

Moreover, we are of the opinion that the time is now ripe for the broadening of the basis of the A.E.S.E. In the great engineering centres, such as Manchester and Newcastle, there are many capable engineers holding responsible staff appointments in large engineering works, who are desirous of joining an organisation adapted to their needs and status. We have had numerous applications from such, and we are firmly convinced that these men would, if admitted into the ranks of the reconstructed A.E.S.E., at once be a credit and a source of strength.

We would suggest, therefore, that the engineers in Newcastle, and Sunderland, and other districts associate themselves with the A.E.S.E., and assist in the formation of an Association of Electrical and Mechanical Engineers which will embrace engineers holding responsible positions both in supply undertakings and engineering works.

The suggestion may appear to be a very wide one, and to some may be open to the criticism that the interests of supply engineers will be relegated to the background. But such a possibility could be prevented by allowing them a section of their own, by means of which they could safeguard those interests with which they were most particularly concerned, and the same would apply to other sections of the engineering profession, whilst on the broader issues affecting the profession as a whole, there would be a common programme and united effort in place of the overlapping and division which at present threaten to make many of our efforts fruitless.

We should be glad if you would bring the above points before your Committee.—Yours faithfully,

J. W. THOMAS, *Hon. Sec.*

[So far as we are in a position to judge, the proposals of the Reconstitution Committee and the sense of the meeting held last week were entirely in harmony with those put forward in the foregoing letter.—EDS. *ELEC. REV.*]

Prohibited Imports.

In your issue of December 14th there is a letter, signed "L. G. Hawkins," upon the above subject, in which he appeals to lovers of fair play for assistance and advice.

His difficulty appears to be that in these days of world-war, he is not allowed to import electrically-heated American novelties. One quite realises his disappointment, but surely it is not difficult to see that it would be grossly unfair to allow these imports to take place, whilst English manufacturers in the same line of business are hopelessly restricted in their use of material and labour.

The pathetic plea of coal- and labour-saving devices is not very impressive to those in the trade. The only coal-saving devices worth any consideration in these days are large cooking installations and electric fires, neither of which were imported from America, but which have developed here during the last three years to a remarkable extent.

It is to be hoped that those shopkeepers to whom Mr. Hawkins appeals for help will, while thinking of their own small losses, also think of the stupendous difficulties under which English manufacturers now labour, and will keep their help and sympathy for those who under great disadvantages loyally carried out the demands made upon them by none too sympathetic Government Departments, to the practical exclusion of civil business.

T. Birkett,

*Manager, Heating and Fittings Dept.,
Simplex Conduits, Ltd.*

Birmingham, December 15th, 1917.

Regarding the letter from Mr. Hawkins, of the Hotpoint Co., *re* above, I agree with him that it seems unfair that while other American goods, less essential to our needs in these times, should be allowed to come into this country, the "Hotpoint" goods are prohibited; of the large range of appliances they have already placed upon the market, there is not the least doubt that the majority are indeed real "labour savers," and if these facts were placed before the Imports Department in the shape of a petition, signed by the leading electricity corporations, wholesale factors, &c., surely the matter would receive the consideration that it is entitled to. Would it not be possible for the Hotpoint Co., in the event of a permit being refused for the complete articles, to make an application to import the necessary parts and have them mounted here, with the view that after the war an English company could be formed, and the whole of their appliances, upon similar lines, turned out in this country, thus creating a new field wherein lies great scope? Or are

we to lie idle, and become a dumping ground for American goods in a similar manner to that in which we allowed Germany to dump her electrical goods here in pre-war days? The matter is one that would require careful handling, and, also, is a big problem for whatever Government we may have in power after the war, there is no disputing the fact that the electrical cooking and heating business has a tremendous future before it. Shall we rise to the occasion? Meanwhile, get the prohibition ban removed, and keep an eye on the future.

A. E. I.

December 17th, 1917.

The E.T.U. or the A.E.S.E.?

I am desired by the Marylebone Branch to state, in reply to "Fuzzed Engineer," that whether belonging to outside firms are not eligible for membership in this Union, so this branch is free from the trouble apprehended by your correspondent. It is difficult to state on-hand the precise terms of a policy, but the effort made to bring about a substantial improvement in the conditions of the generating and distributing staffs of the power stations, whether privately or municipally owned, and the effort made with a view to securing a base rate for London and Greater London should be a sufficient indication to workmen and engineers alike that this Trade Union is proceeding along sound lines. The Marylebone Branch of the N.A.U.E. are of opinion that many of the difficulties they have encountered during the progress of negotiations with the various authorities would not have occurred had the station engineers stood firmly with the men. One engineer told one of our members that he went in by the front door and signed for salary, while the workmen went in by a side door and drew wages, and the only privilege he got was that of drawing 10s. a week less. The engineers are, not contented, but still they hold aloof from the wages staff, and suffer accordingly.

The extremely high cost of living affects all alike, and the Branch submit that the following calculation has never been proved wrong:—

An engineer earns two guineas per week; he pays 10s. a week rent; in pre-war days that left 32s. for necessities. Suppose, for argument's sake, he bought 16 lb. of tea at 2s.; to-day he still requires 16 lb. of tea, but since he has to pay 4s. for it, he must get 32s. from somewhere to meet the difference. His salary and bonus should, therefore, be equal to 74s. per week. It was stated in the Branch that lamp oil costs 2½d. per pint, candles 10d. per lb., bootlaces 6d. per pair, firewood 1d. per bundle, and so on *ad infinitum*. These unconsidered household necessities are part and parcel of our everyday life, and it is fashionable for Cabinet Ministers to omit all reference to these things in their speeches. If an engineer is still in receipt of a low salary, the task of maintaining the semblance of a decent existence must be unconscionably hard.

The Branch would advise the station engineers to work out their salaries on the poverty line of pre-war days, viz., 30s. per week. Taking 6s. for rent, there would be left 24s.; add the sum now required to make up the purchasing power under present conditions, 24s., the total salary received would therefore be 54s. This 54s. represents the poverty line to-day, and the Marylebone Branch of the N.A.U.E. would like to know how many station engineers are on or below this line. If 6s. be added for rent in their case, £3 per week stands as the poverty line for the educated craftsman of to-day, for it is quite obvious that the engineer would not live in the crowded areas where rents are cheap, and the surroundings not particularly nice.

The problem of how to bring home these hard facts to the authorities is still engaging the attention of the Branch, and it is hoped that the station engineers will accord us a little more support than they have done hitherto.

J. Vincent,

Branch Secretary.

Firemen, Mechanics and Electrical Workers.*

London, N.W., December 15th, 1917.

The Functions of a Borough Electrical Engineer.

Having an overdue account which I was unable to collect. I tried to collect it through the medium of the local County Court. During the hearing of the case, much to my astonishment, although he knew absolutely nothing of the case, nor what I have expended in time, labour, and material, Mr. McInnes, the borough electrical engineer, appeared to give evidence in favour of defendant, and, owing to what he said, I was awarded only half the amount of my account, the whole of which I have since had to pay out in court fees and other expenses connected with the case.

The Judge was as much surprised as myself at the appearance of the borough electrical engineer, and he put this question to him: "Are you the borough electrical engineer?" The reply was, "Yes." "And what," said the Judge, "are you doing mixed up in this case?" The reply was this: "Defendant is a consumer, and I have to look after his interest." But he omitted to say that I, also, am a large consumer, and, according to his own statement, it is his busi-

ness to study my interest as well as that of defendant, but this he neglected to do.

The following is a correct statement of my account, the whole of which I have lost through the unjustifiable interference of the borough electrical engineer:—

Amount of my account for work done and material supplied, £4 12s. Cost of time, labour, and material, £3 13s., thus showing a profit of 19s. Amount awarded by the court, £2 12s. Expenses for court fees, &c., £2 17s. 6d. So, as you can readily see, I have not only lost the full amount of my account, but have also had to pay out 5s. 6d. more than the court awarded me.

Is not this a case of precedent created by the official in question? For I can hardly believe that Corporations allow their highly-paid servants to waste valuable public time in private matters which do not concern them or the public. And I draw your attention to the case, Sir, because, in my opinion, it seems outrageous that a public servant should be allowed to take sides in private business matters and assist one ratepayer to the detriment of another. Thanking you in anticipation for giving the matter publicity.

H. Brand.

Gravesend, December 17th, 1917.

The Efficiencies of Lighting Systems.

I should like to criticise the article in the REVIEW of December 7th on "Modern Arc Lamps and Incandescent Lamps" as being very misleading in the study of the relative efficiencies of the different systems of lighting, and not helpful in the propaganda of scientific illumination.

Undue prominence is given to semi-indirect lighting at the expense of the direct method, and are lighting against both.

The two outstanding features of the article are:—First, the author's method of rating lamps, and, secondly, the unfair example of direct lighting.

In the third paragraph of the article the author states that "When used in a suitable fitting the 'half-watt' lamp consumes 0.55 to 0.9 watt per c.p.," and then, as a footnote, says: "Here and hereafter reference is to *mean lower hemispherical British candle-power* unless otherwise stated."

I can only take it that this method of rating was quoted to make are lamps appear in a more favourable light.

The correct output of a lamp is its total output, i.e., *mean spherical candle-power* or *lumens* (which is the *mean spherical candle-power* $\times 4\pi$), and only by this rating can two sources be compared. The illuminating result of the sources is another question, and depends upon the distribution, which, again, depends upon the equipment used.

Further on in the article the author states that the "half-watt" lamp emits practically equal quantities of light upwards and downwards, which is so; therefore, on the author's working, the third paragraph could have read that the "half-watt" lamp consumes 0.55 to 0.9 watt per *mean spherical candle-power*, and on this working I should like to hear from the author his figures on the arc lamps, quoted in M.S.C.P., as arc lamps notoriously give their light in one hemisphere only.

The next point to which I desire to draw attention is the statement that "semi-indirect lighting is cheaper than direct lighting" (or for practical purposes equally cheap) where half-watt lamps are used, and the ceiling is white.

I am more or less in agreement with the author, if one uses the type of direct unit which he quotes, viz., a 300-watt lamp in an opal globe, but is this a fair and efficient unit for comparison?

In the first place, the term "opal globe" is very ambiguous; there are different kinds of opal, pot or flashed, dense or light in density. The writer has tested commercial opal globes which have varied in absorption to the extent of 30 per cent.

I am not familiar with the "Kandem" semi-indirect fitting quoted, but it is fairly safe to assume it is an opal bowl.

Now let us consider the units together. For the direct unit the lamp is totally enclosed in an opal globe, and in the semi-indirect, an opal hemisphere or bowl is used.

Opal has the property of diffusing the light equally over its whole area, therefore, in the case of the direct lighting, 50 per cent. of the light is in the upper hemisphere, and 50 per cent. in the lower. A portion of this upper 50 per cent. is, as the author remarks, reflected down by the reflector, after passing through the opal envelope, which entails certain losses, and is again passed through the opal globe and further weakened, the resultant illumination thereby being considerably reduced.

On the other hand, the semi-indirect unit being open on the top, the light in the upper hemisphere only has to stand the loss, due to the reflection from the white ceiling, and from this comparison the author states that *semi-indirect lighting is cheaper than direct lighting*.

I consider that the totally-enclosed unit is as much semi-indirect, or at least semi-direct, as the bowl with an open top, and it certainly should not have been quoted as an efficient direct unit.

The proper comparison should have been with the most efficient type of open reflector against the most efficient of the semi-indirect and indirect systems, when the author will find that semi-indirect lighting is 40 per cent., and indirect

lighting 82.5 per cent. dearer than direct lighting, given identical conditions to obtain the same foot-candle illumination per watt consumption.

E. Stroud,

Lieutenant, R.N.V.R.

Wimbledon, December 18th, 1917.

NOTES FROM CANADA.

(FROM OUR SPECIAL CORRESPONDENT.)

Owing to the immense demands for power for the manufacture of munitions in Ontario, it is becoming increasingly difficult for the great power companies at Niagara Falls to cope with the situation.

Sir Henry L. Drayton, who is chairman of the Dominion Railway Board, was commissioned a short time ago to report on the quantity of power developed at Niagara Falls and the proportion of this power which is exported to the United States. Still more recently, this gentleman has been appointed Power Controller by the Dominion Government, and in that capacity will investigate the entire power situation, particularly as regards quantities actually used and required by Canada, and quantities exported to the U.S. not only at Niagara, but at other points.

It has been proposed in certain quarters that Canada, needing all the power at present being developed in the country, should stop all export at once, but this would result in international complications, the more so as, while Canada claims that the power is required here for the manufacture of munitions, the counter claim in the U.S. would be that it is practically all being used for that very purpose there at the present time, and therefore there would be, of course, no gain to the cause of the Allies.

So far as Ontario is concerned, the United States could easily put the screw on in retaliation by reducing or stopping the export of coal, and seeing that this Province has no coal of its own at all, the plight of the people in such a case during the severe winters experienced here can be imagined. It is, however, not in the least likely that either country will take any step tending to irritate the other. The U.S. has just appointed a Commission of two men, Col. Keller, of Washington, and R. J. Bulkeley, of Cleveland, who will co-operate with Sir Henry Drayton regarding all electric-power matters as between the two countries.

Besides power for electric motors in the numerous shell factories at present in operation, a number of electric furnaces for steel making and other purposes has been erected since the beginning of the war in various parts of Ontario, the largest of these installations undoubtedly being one in Toronto, where 10 six-ton furnaces of the Héroult type have been installed; several of these are now in operation, and when all are working there will be a power demand of about 15,000 kw., which is about one-third of the demand of the entire city of Toronto.

The city just referred to is having a taste of war limitations just now, as the street lamps are not put on till 6 p.m., which means that everything is in complete darkness for 15 or 20 minutes each evening—this is to reduce the peak until the factories, offices, &c., begin to close. The citizens have also recently been appealed to by the Toronto Hydro-Electric Commissioners to assist in keeping down the peak by using as few lights, electrical appliances, &c., as possible between the hours of 4.30 p.m. and 6 p.m. Owing to the fact that all the electric power available is generated in hydro-electric plants, there is no object in reducing the actual power consumption, as there is no question of saving coal involved, as in England; the only thing that matters is to reduce the peak.

Like other countries, Canada is taking an interest in scientific research work to an extent that would have been impossible before war broke out. Some considerable time ago a Research Commission was appointed by the Dominion Government, and investigations are being carried on regarding the utilisation of the vast lignite beds of the Western Provinces, the fixation of atmospheric nitrogen for war, agricultural, and other purposes, and many other matters. The Regina Scientific Research Association not long ago proposed that the Dominion Government should be urged to provide \$2,500,000 annually for five years, to be divided among the various Provinces for research work; suggestions were made as to how the money might best be spent.

Iron and Steel Trade Combination.—It is stated in the Times that arrangements have been provisionally made for the amalgamation of the following iron and steel companies:—Steel, Peck & Tozer, Phoenix Special Steel Works, Rotherham; Samuel Fox & Co., Stockbridge and Sheffield; the Frodingham Iron and Steel Co., Scunthorpe, Lincolnshire; and the Workington Iron and Steel Co., West Cumberland. A new company will acquire the entire assets of these companies. The capital of the companies involved amounts to about £1,000,000.

THE PROPERTIES OF ELECTROLYTIC COPPER—MODULUS OF ELASTICITY.*

By B. WELBOURN, M.I.E.E.

IN an address to the Manchester Local Section, the author referred to independent tests made in the National Physical Laboratory, and by Mr. W. B. Woodhouse, to determine the modulus of elasticity of solid hard-drawn copper conductors, and suggested that an all-round value of 18,000,000 might be adopted in future. Other published values are as follows :—

	Solid wires.	Stranded wires.
Verband Deutscher Elektrotechniker ...	18,500,000	—
Kapper (German)	19,000,000	11,400,000
Coombs (American)	16,000,000	12,000,000

In order to get actual values under working conditions, tests were made on an experimental span of about 150 ft., and special precautions were taken to prevent movement or bending of the terminal posts. The sizes of conductors used were as follows :—

0.025 sq. in. =	7/0 068 in. bare hard-drawn copper strand.
0.05 " " =	7/0 097 in. " " "
0.10 " " =	19/0 083 in. " " "
0.25 " " =	37/0 092 in. " " "

These were standard E.S.C. strands taken from conductors made for overhead transmission lines, and not specially manufactured. Each test was made as follows :—

The points of suspension of the experimental span were so arranged as to be level, and the supports quite rigid. The span length under test was pulled up to about 6 in. dip (i.e., just under half the breaking stress) and left for two hours to allow the strand to settle down. The strand was then let out to approximately 12 in. dip (i.e., about one-fifth of the breaking stress) and the dip d_1 at the centre of the span was measured. The span length was then loaded with an extra length of the same size of strand, this being bound to the first strand by means of a lapping of string, and the new dip d was measured. This was practically equivalent to loading the strand with its own weight of ice distributed evenly along its length. The measurements were made in still air and at the same temperature.

On removing the extra length of strand, the original strand returned to dip d_1 , showing that the strand had not slipped at the terminations and that it had not been strained beyond the limit of proportionality. The weight of the binding string was taken into account in working out the modulus.

From these results the modulus was calculated by the formula due to Prof. Alfred Still, namely—

$$w_1/d_1 - w/d = 64 (d_1^2 - d^2) M A/3 l^4$$

- where w_1 = weight per ft. of unloaded strand (lb.).
- w = " " loaded strand (lb.).
- d_1 = dip in ft. for w_1 .
- d = dip in ft. for w .
- M = modulus in lb. per sq. in.
- A = cross-section of strand in sq. in.
- l = length of span in ft.

Repeat tests were made, and the same results were obtained in every case. The values obtained were as follows :—

	0.025" (7/0 068")	0.05" (7/0 097")	0.10" (19/0 083")	0.25" (37/0 092")
A	0.025	0.05	0.10	0.25
w_1	0.09967	0.2027	0.404	0.967
w	0.2035	0.4097	0.8124	1.937
d_1	1.0	0.8333	1.00	0.666
d	1.526	1.3645	1.583	1.177
l	143.42	144.42	150.42	141.42
M (in millions) ...	20.11	19.84	17.36	15.46

It will be noticed that the modulus decreases as the number of wires in the strand increases, i.e., the modulus of a strand apparently depends on the number of wires composing it.

From the above considerations the following may be taken as suitable working figures :—

7-strand cable	20,000,000 lb. per sq. in.
19-strand "	17,500,000 "
37-strand "	15,500,000 "

The terminal posts are not stiff enough to permit of tests on 61- and 91-strand conductors, which are, however, seldom used except on short low-pressure lines with short spans, and their modulus is not of much importance. A consideration of the above figures, when plotted on a curve, suggests, however, that the following values might be taken for them :—

61-strand	14,000,000
91-strand	12,500,000

As a result of this experimental work with long spans, the author wishes to modify his earlier recommendation of 18,000,000 for solid wire, which was chiefly based on the work at the National Physical Laboratory on quite short lengths of wire. The further work now reported confirms Mr. Woodhouse's result of 20,000,000 for working conditions, and this is the value which should be adopted when designing transmission lines.

* Abstract, from the *Journal* of the INSTITUTION OF ELECTRICAL ENGINEERS.

LEGAL.

BESSANT v. STEVENS.

SITTING at Lewes at the Sussex Assizes on December 11th, Mr. Justice Bray commenced the hearing of this action, in which plaintiff, an electrical engineer of Eastbourne, sued defendant, an Eastbourne builder, for the recovery of £522 for goods supplied and work done. The opening statement by plaintiff's counsel was to the effect that the issue had been reduced to a short and intelligible one. There was no question of amount, but simply whether or not defendant was liable. The real question was whether the work was done by plaintiff on the order of the defendant, or whether the real persons liable to the plaintiff were a company of which the defendant was chairman, and over the whole of the assets of which he had a debenture. As reported in the *Sussex Daily News*, it was stated that plaintiff was aware of the building of a cinema at Seaside, but he knew nothing about a company when he undertook the electrical equipment of the theatre on the order of defendant, for whom he had done a lot of work previously. That was the work for which plaintiff was now suing. The accounts had always been rendered to defendant, and it was not until some time later that any suggestion about that was made. Plaintiff had agreed to take 100 shares in the Cinema Co. a part payment of his account, and subsequently, on the suggestion of defendant, plaintiff became a director of the company. On finding that defendant had included plaintiff's account in a memorandum of the general liabilities of the company, plaintiff protested that he had done the work on the order of defendant and looked to him for payment, but suggested an arrangement for payment by the company, provided defendant gave his personal undertaking to pay in the event of the company making default. Upon this defendant repudiated personal liability, and said the debt was that of the company.

PLAINTIFF, who was called in support of counsel's opening, said he had been doing business with defendant for about 25 years, and thousands of pounds had passed between them. When defendant was building the cinema in February, 1914, he had a conversation with witness, in which he asked him to go in for fitting it up with the electrical equipment, as it was a good thing and he ought to be in it. Witness told him he had no money to lock up in cinemas, but he sent his electrician to report on the requirements. Correspondence ensued, and then defendant gave him a verbal order for the work. On his telling defendant he wanted money, and that he must make some arrangement to let him have it, defendant said he had none. Witness then suggested that he should draw on defendant for £100 by bills, and he agreed. When, however, the bills reached him he noticed that those witness had drawn up had been substituted by two others drawn by defendant and signed by the directors of the cinema company, the name of which was the Eastbourne Picture House, Ltd. The bills were eventually returned dishonoured. After becoming a director of the company in 1915, on defendant's suggestion, witness was asked at a meeting of the company whom he looked to for the payment of his account. He replied that he looked to defendant, as he always had done, and he objected to it appearing in a memorandum of the company's liabilities.

The hearing was adjourned.

THE SPEED OF AN ELECTRIC MOTOR-VEHICLE.

BEFORE Mr. Justice Coleridge, in the King's Bench Division, on Wednesday, last week, an action was heard in which Mr. John Leinweher, of 106, Brook Road, Kensington, sued Messrs. Brown and Polson, Ltd., of 6, Bouverie Street, E.C., to recover damages for the death of his son. He was knocked down and killed by the defendant's electric motor-lorry, owing, it was alleged, to the driver failing to keep a proper look-out, and also driving carelessly.

Mr. J. A. Hawke, K.C., appeared, with Mr. P. B. Moile, for the plaintiff, and Mr. Harold Brandou was counsel for the defence.

The driver of the electric motor-lorry said the lad cut right across him, and, although he jammed on his brakes, he could not avoid the accident. There could be no question of his going at an excessive speed, as the electricity would not allow him to do so.

COUNSEL expressed surprise, and the witness explained that these electric motors were charged overnight to go 50 miles in the day, with a top speed of 10 miles an hour; they could not do more. Towards the end of the day—and this was 5.30 in the afternoon—the charge got weak, and he could not possibly have been going more than 7 miles an hour.

COUNSEL said it would have to be accepted that he was not going at too great a pace, but he had never heard of it before.

The JUDGE said it was news to him.

The jury found for the defendant, and judgment was entered accordingly, with costs.

NEWCASTLE-UPON-TYNE CORPORATION v. MARSHALL.

AT Newcastle-upon-Tyne County Court, on the 11th inst., before Judge Greenwell, an action was brought by Newcastle-upon-Tyne Corporation against Private Frederick Marshall, Royal Flying Corps, to recover damages in respect to damage to two tramcars caused, it was alleged, by defendant having negligently driven a military motor-lorry in New Bridge Street, in the city. The sum claimed was £60 15s. 6d. There was a counter-claim by the Secretary of State for War against the Corporation for damage to the motor-lorry alleged to be due to the negligent driving of the tramcars, and £58 19s. 5d. was claimed. His Honour gave judgment for the Corporation in both instances.

SOLDIERS' TRAMWAY FARES.

By a decision of the West Riding Magistrates sitting at Wakefield, on Friday, the point was settled that soldiers as such were not entitled to travel on tramcars as ordinary workmen at the half-fare rate. The case was that of the Yorkshire (W.R.) Electric Tramway Co. against Robert Brown, a corporal guarding prisoners in the Lofthouse Park German Prisoners' Camp.

NEWCASTLE-UPON-TYNE CORPORATION v. SLATER.

At Newcastle-upon-Tyne County Court, on the 12th inst., the City Corporation sued Lance-Corporal J. Slater, A.S.C., for £1 18s. 6d., for damage to one of the tramcars caused by the alleged negligence of the defendant when driving a motor-lorry in Scotswood Road. His HONOUR gave judgment for the plaintiffs, with costs.

BREACH OF LIGHTING REGULATIONS.

At the Bury County Police Court, last week, Ernest Turner, electric wireman, was summoned for a breach of the lighting restriction order on the premises of the Lancashire Power Co., at Ramsbottom. He admitted responsibility, and was fined 10s.

WAR ITEMS.

Part-time National Service.—We cordially welcome the announcement that Sir Auckland Geddes, the Minister of National Service, has appointed a committee to go exhaustively into the question of part-time labour. Large numbers of men and women who are not able to join the fighting forces or to engage for whole-time service in the manufacture of munitions or in work on the land, would, we believe, be glad to render assistance if only a properly organised scheme for utilising their services in their own district in duty which they could be assured would be of service to the State, were put before them. In these days, when the demand for man and woman power is so pressing, it should be possible to so re-organise present efforts of the kind as to increase their efficiency in the gross, and at the same time to secure a certain measure of help from exempted men and from thousands over military age who are unfit for actual military service. We are entirely in sympathy with those who would like to see pressure brought to bear upon capable men and young idling women to make some contribution of service to the National cause. So far as is practicable everybody ought to be doing something, according to their health and abilities, to assist. Extension of the Military Service Acts and measures of Industrial Conscription are admittedly undesirable but if as a result of this inquiry means can be found for securing the fullest use on work of National importance of all forms of part-time work and for assuring co-operation of voluntary bodies which are in a position to undertake the effective organisation and administration of part-time schemes, the setting up of the committee will be amply justified. Exactly what ground is to be covered is not stated, but we presume that the voluntary work performed by the Volunteers, the Special Police, the Red Cross men and women, the canteen workers, the week-end agricultural and munition workers, is all included in the inquiry.

The amount of work that has been rendered by these classes of part-time workers in the aggregate must make a magnificent showing, but how much greater it might be! It is conceivable that some of the present overlapping and waste of labour even among existing workers might be avoided and that by a better organisation of their services men might be released for whole-time pressing National labour on shipbuilding or for the fighting forces, that the staff necessary for compulsory rationing might be found, and that in various other ways the public might be assisted in carrying the increasing burdens of very trying days. We believe that the committee will find it possible to produce a scheme which will ensure a far more satisfactory response and co-operation than could ever have been reasonably expected from those appeals which we all received and those stupid processions of the early months of the present year.

Control of Steel Supplies.—The Order of the Minister of Munitions dated Nov. 20th, 1916, as to control of steel supplies has been amended. The effect of the revision is shown by the following corrected reprint of Clause I. The italicised words are now deleted and the words in parentheses are added:—

"No order for steel made by the Open Hearth or Bessemer (or electric) process other than *Shell Discard Quality* shall be accepted for manufacture and no such steel shall be manufactured unless the purpose for which the steel is required is approved."

Clause 7 now reads as follows:—"No steel shall be manufactured for any order below Class B"—the words "*other than Shell Discard Quality*" being omitted.

The original order will be found in the *Board of Trade Journal* for Nov. 23rd, 1916.

Scrap Steel Collection.—Mr. W. Davie, Glasgow, Scrap Superintendent in Scotland under the Ministry of Munitions, on Friday addressed a largely attended meeting, at which Lord Provost Taggart presided, and emphasised the importance of as much scrap metal as possible being collected for munition-making purposes. It was agreed to organise a scheme in Aberdeen and district. The Lord Provost mentioned that the new electric steel works to be started in Aberdeen in a few weeks should get the first chance of any material available, and it was suggested that another factory might be started in Aberdeen to deal with material that might be forwarded from towns and villages in the North of Scotland—a suggestion which was received with hearty applause.

Shortage of Coal in Bohemia.—A Reuter dispatch from Zurich states that the electrical works at Kolin, Bohemia, have been closed down through lack of coal, with disastrous results to the whole of the surrounding country. Fourteen towns and 35 village communities are without light. Eight sugar refineries, eleven large mills, fifteen engineering works, the railway works and numerous other industrial establishments are all obliged to stop work.

Exemption Applications.—The Dartford Rural Tribunal has granted six months' exemption to A. G. Phillips (C3), electrician, of Darenth.

The County Appeal Court heard seven appeals by the Rotherham Corporation Tramways Department for motor-men, conductors and a mechanic. It was stated that it had been found practically impossible to obtain substitutes to replace even the ordinary leakage of men leaving for more remunerative occupations, let alone for military purposes. If more men were taken it would seriously interfere with the 50 special munition cars run daily. In 1914 9,800,000 passengers were carried, and now the rate was 20 millions. Before the war there were 50 motor-men, 50 conductors and 35 cars; now there were 77 motor-men, 78 conductors (two of whom were men) and 58 cars. Four of the men were ordered to report for service on Jan. 15th, and the others were given open exemption until the end of March.

A firm of electrical engineers at Gloucester opposed a military review of the exemption held by a qualified electrician (40, Grade 2). The firm said that a large number of employees had enlisted and that this man was the only qualified one left in the business. The appeal was disallowed, and the exemption allowed to continue in force.

At Gloucester, a firm of electricians appealed for the retention of an electrician, the only general-service man in their employ. The Tribunal granted exemption until March 7th, and advised the employers to obtain a protection card.

At Axbridge, the Winscombe Electric Supply Co. appealed for E. E. Hill (42, C1), engine driver at the supply station. It was explained that owing to the depleted staff the man now had to perform many duties which hitherto had not been included in his work, and that fact made him more indispensable than he had previously been. The Military Representative did not oppose the appeal, and conditional exemption was conceded.

At Eastbourne, Mr. Bessant, electrical engineer, appealed for S. O. Hoad (42, C3), electrician, and 12 weeks' exemption were granted.

A dealer in electrical goods (31, B2), who appealed at Wigan, stated that he had three brothers serving in France, and he was granted exemption until April 1st.

BUSINESS NOTES.

Calendars for 1918.—From HUDSON'S ELECTRICAL ENGINEERING CO., LTD., of Park Row, Leeds, we have received a wall calendar with monthly sheets for 1918. The upper half of each sheet has a half-tone view of some city of note at home or abroad.

Plant for Disposal.—Manchester Electricity Committee has for sale one 350-H.P. Willans engine, coupled to a 220-kw. Electrical Co.'s generator; three Yates & Thom A.E.G. 1,500-kw. engine alternators; Maidstone Electricity Committee invites tenders for one 150-kw. Peache-Westinghouse D.C. set, 160-550 volts, together with switchgear; Leeds electricity department invites offers for a quantity of surplus plant, including engines, alternators, and condensing plant. Full particulars of these items are given in our advertising pages to-day.

Catalogues and Lists.—STONEBRIDGE ELECTRICAL CO., LTD., 72, Windmill Road, Hampton Hill, Middlesex.—Illustrated price list giving details of their electric heaters.

QUEAD, LTD., 17-57, Marylebone Lane, Oxford Street, W.—Eight-page pamphlet giving illustrated particulars and prices (with a 10 per cent. advance) of "Quead" electric fires.

MESSRS. COLE, MARCHANT & MORLEY, LTD., Prospect Foundry, Wakefield Road, Bradford.—Twenty-page, illustrated catalogue giving full matter relating to their vertical steam engines for superheated or saturated steam, also brief particulars and half-tone views of a number of installations for which they have been supplied, including electric supply, textile and flour mill, rolling mill, and pumping work.

Liquidations.—**BRITISH HIGH POWER GAS ENGINE CO., LTD.**—Winding up voluntarily. Mr. F. G. Palin, liquidator. Meeting of creditors December 21st.

EDISON MANUFACTURING CO., LTD.—Winding up voluntarily. Mr. A. F. Wagner, 161, Wardour Street, W. 1, director and manager of Thomas A. Edison, Ltd., is liquidator. Meeting of creditors December 28th.

NATIONAL ALLOYS, LTD.—Winding up voluntarily. Mr. A. Hodgkinson, 22, Queen Street, E.C., liquidator.

INVICTA ENGINEERING CO., LTD.—Meeting January 15th, at 27, Chancery Lane, W.C., to hear an account of the winding up. Liquidator, Mr. F. C. Harper.

Trade Announcement.—**MESSRS. R. W. BLACKWELL AND CO., LTD.**, have removed to 36, Emperor's Gate, South Kensington, London, S.W. 7, their offices having been requisitioned by Government.

Book Notices.—*Journal of the Institution of Electrical Engineers.* Vol. LVI, No. 269. December, 1917. London: E. and F. N. Spon, Ltd. Price 7s.—This issue contains the presidential address by Mr. C. H. Wordingham, inaugural addresses by Capt. O. T. O'Kelly Webber and Messrs. W. Lang, A. W. Marshall, R. H. Fletcher, C. J. Beaver, A. Page and S. T. Allen, a paper on "The Properties of Electrolytic Copper—Modulus of Elasticity," by Mr. B. Welbourn, and the thirteenth list of members on military service.

The sixth number of the *Journal of the British Science Guild* has now been issued. Copies, price 6d. each, may be obtained on application to the Secretary, British Science Guild, 199, Piccadilly, London, W. 1.

Telephone Troubles. By W. H. Hyde. London: S. Rentell & Co., Ltd. Price 7d. net.—This is the eighteenth edition of this handy little work, which covers both magneto and common-battery systems, detailing the symptoms and nature of faults and explaining the diagnosis and method of rectifying them. A good deal of information is also given regarding the apparatus used, with numerous diagrams. Hitherto the booklet has related mainly to telephone practice in America, where it originated, but in view of the demand in this country it has been revised to bring it into accordance with English practice, and printed in this country. After the war it will be further improved with this object in view, and we would suggest that it should be extended to cover intercommunication telephones, &c., if possible.

Following on the special issue of the *Illustrated London News* dealing with the work of the Royal Flying Corps, recently noticed here, a companion issue has been published illustrating "the Work and Training of the Royal Naval Air Service," with an introduction by the First Lord of the Admiralty, Sir Eric Geddes. The whole issue is printed in photogravure, and reaches the highest standard of reproduction, while the subjects of the illustrations, which constitute practically the whole of the issue, are of surpassing interest. They include a number of views of wireless telegraph sets, and operators learning to use them; and we note that the aircraft not only send, but are also able to receive, messages whilst flying. The issue deserves the highest commendation, covering as it does every branch of R.N.A.S. activity, and admirably illustrates the excellent work of the Service. It may be obtained from the offices of the *Illustrated London News*, price 2s. 6d. net.

L.C.C. Electrical Contract Conditions.—**RETENTION MONIES.**—The General Purposes Committee of the L.C.C. this week recommended the Council to amend its Standing Order No. 295 (d) (i) respecting payments for contracts for machinery. Under the original Order payments have been made as follows:—

50 per cent. of the contract price, less the provision money for extras, on delivery of the machinery.

25 per cent. after erection.

15 per cent. after the trial or testing of the machinery.

Balance after the expiration of the prescribed period of maintenance (usually 12 months).

"For some time past manufacturers of electrical machinery have been willing to enter into contracts with the Council only on condition that payments were made in accordance with the payments clause included in the Model Conditions of the Institution of Electrical Engineers, and most of the recent contracts entered into for electrical machinery required for the tramways department have provided accordingly."

The Highways Committee states that this clause has been accepted or acquiesced in by other public authorities, and that it would adequately safeguard the Council's interests. In these circumstances, and having regard to the decision of manufacturers only to enter into contracts based on this clause, the Highways Committee suggests that the Order should be so amended that the I.E.E. model payments clause may be included in contracts for electrical machinery. The General Purposes Committee concurring in the suggestion, recommends that the following be substituted for paragraph (d) (i) of Standing Order No. 295:—

(1) In contracts for machinery other than penstocks and machinery which has to be erected under similar conditions—80 per cent. of the contract value of the plant from time to time delivered, or work executed on the site; 10 per cent. one month after the plant is taken over, and 10 per cent. after the expiration of 12 months, provided that—

1. Should minor defects arise which would not affect the commercial use of the plant, only such part of the retention money shall be retained as represents the cost of making good such defects.

2. If the contractor is prevented (a) from delivering plant from causes for which the purchaser is responsible, or (b) from erecting plant already delivered, owing to causes for which he is not responsible—

80 per cent. of the value of such plant is to be paid for after notification that plant is ready for delivery or for erection; and

If such delay exceeds two months, one-half of the retention money is to be then paid, and the remainder at the expiration of 15 months from the date of the above notification; and such payment of retention money is to be reduced by an amount to be agreed upon to cover the cost of delivery, erection and maintenance.

France.—A new company has lately been formed at Levallois-Perret, Paris, with a capital of £10,000, and the title *La Société des Etablissements Esselbé*, to manufacture magnetos, and engine-starting and car-lighting sets for motor vehicles.

LIGHTING AND POWER NOTES.

Ashton-under-Lyne.—**PRICE INCREASE.**—The Electricity Committee has decided to increase the charges for energy from the end of the present quarter, as follows:—Lighting, 15 per cent.; d.c. power, 15 per cent.; A.C. power, '06d. per unit. The Council has approved the increase.

Beckenham.—**PRICE INCREASE.**—The U.D.C. has decided to increase the charge for lighting, from December 25th, to the maximum allowable under the order, viz., 8d. per unit; and the charge for power and heating by 3d. per unit, as from the Christmas quarter.

Bedford.—**PRICE INCREASE.**—In order to meet increased expenses, the T.C. has advanced the price of energy for lighting to 6d. per unit, instead of 5½d., plus 10 per cent.; for heating, to 1½d. per unit, and, for power it has fixed a sliding scale:—First 500 units, 2d. per unit; second 500, 1½d.; beyond, 1½d., with a minimum charge of 5s. per quarter. All accounts, except where the coal clause applies, are subject to 2½ per cent. discount.

Bexhill.—A financial statement of the working of the Corporation electricity undertaking for six months ending September compares very favourably with the result for the corresponding period of the previous year. The Committee has decided that no new main extensions shall be laid, and no new house services without special consent.

Brimington.—**E.L. PROPOSAL.**—A public company, on co-operative lines, is to be formed, with a capital of £2,000, for the purpose of establishing electricity works in the parish.

Carlisle.—**PRICE INCREASE.**—The charges for energy have been advanced by the T.C. by a further 10 per cent., making a total increase on pre-war rates of 20 per cent.

Colchester.—**STREET LIGHTING.**—The T.C. has decided to pay 10 per cent. extra for electricity for public lighting for the New Year.

Colne.—**PRICE INCREASE.**—The Corporation has decided, in view of the increased cost of coal, to adopt a flat rate of 5½d. per unit for electricity for lighting purposes, an increase of 3d. For power purposes there will be an increase of one-eighth of a penny per unit.

Darlington.—**PRICE INCREASE.**—The T.C. has increased the price of electricity for power by 1½d. per unit.

Dublin.—**WAGES.**—At its meeting on the 15th ult., the Electricity Supply Committee recommended the Council to grant the members of the technical staff of the Corporation electricity supply the award of the Committee on Production, which had been already granted to the tradesmen and fitters working under the technical staff's supervision. A motion in favour of the recommendation came before the Corporation, but it was rejected in favour of an amendment proposed by Councillor P. T. Daly that the matter be referred to a Special Committee for report as to what Trade Union the men were connected with.

The technical staff have intimated to the Lord Mayor that they wish the matter to be submitted to immediate arbitration. They point out that some of their number have not received any increased remuneration since the war began, except a 5s. war bonus granted generally to Corporation employees and officials. It is requested that the arbitration shall take place before 4 p.m. on Monday next.

Glasgow.—**PLANT EXTENSIONS.**—The electrical engineer has reported additional requests for supplies of energy amounting to 28,000 h.p., and urges the necessity of ordering additional generating plant for the Dalmarnock station.

The Committee has recommended negotiations for a second 15,000-kw. Westinghouse turbo-alternator or larger set.

Glossop.—**STREET LIGHTING.**—The T.C. has accepted the offer of the Urban Electric Supply Co., Ltd., for the maintenance of 15 street lamps for a year at £51 6s., and for the maintenance of four fountain lamps at £8 8s.

Grangemouth.—At a meeting of the T.C., last week, a letter was read from the Scottish Central Electric Power Co., requesting permission to erect an emergency overhead low-tension three-phase line through the streets to the granary. It appeared that the authorities concerned had decided to install electric light owing to the fire danger arising from so much wood. It was agreed to grant the permission requested during the pleasure of the Council.

Grimsby.—PRICE INCREASE, WAGES, &c.—The Electric Lighting Committee has decided to recommend an increase of 15 per cent. in the charges for electricity.

An increased war bonus is to be granted to all members of the electricity staff: all male employees over 18 are to receive a sum which, together with any advance in wages since August, 1914, shall not exceed 15s. per week, the increase to date from August 1st last, also an additional 5s. from February 1st, 1918; those under 18 years of age will receive a war bonus of 7s. 6d.

Hull.—PRICE INCREASE.—The T.C. has increased, as from January 1st, the price of current for lighting by $\frac{1}{4}$ d. per unit, and for all other purposes by $1\frac{1}{2}$ per cent. on the existing charges.

Ipswich.—PRICE INCREASE.—The T.C. has further increased the price of current for ordinary lighting from $5\frac{1}{4}$ d. to 6d. per unit, the rateable value tariff from an increase of $33\frac{1}{3}$ per cent. to an increase of 50 per cent., and the heating and cooking tariff from an increase of $33\frac{1}{3}$ per cent. to an increase of 50 per cent. from the beginning of the March quarter, 1918.

The chief electrical engineer (Mr. Ayton) has appealed to all private consumers to reduce their lighting, &c., as much as possible from sunset to 6.30 p.m. on all evenings except Sunday and Wednesday, as not only is there a great demand for electric power, but the varying quality of the coal now supplied makes it difficult to maintain steam pressure at the required figure.

Kendal.—STREET LIGHTING.—The T.C. has accepted the tender of the electricity department for public lighting at Waterside at £45; the Gas Committee tendered at £46 6s.

London.—HACKNEY.—The Electricity Committee reports that the electricity supply undertaking is developing much more rapidly than was anticipated. Daily maximum loads are now being experienced reaching between 7,000 and 8,000 kW.; the total plant installed, including the whole of the machinery, has a capacity of 12,200 kW., but the largest set is 5,000 kW., and in the event of the temporary failure of this set, they would be left with only 7,200 kW.—that is to say, 3,000 kW. of alternating current and 4,200 D.C. plant. The position is really worse than these figures show, because requirements of alternating current exceed 3,000 kW., and it is not possible to deal satisfactorily with the transmission of the 4,200-kw. D.C. along the low pressure feeder mains. A recent failure of the 5,000-kw. set led to curtailing the supply to large consumers. The Committee is advised that it would be taking an undue risk if it delayed the installation of additional plant, and has therefore instructed the borough electrical engineer to find out what plant is more or less under construction for stock and which can be delivered in time for next winter's maximum load, and he is now considering offers from Messrs. Willans & Robinson, the British Thomson-Houston Co., Messrs. Fraser & Chalmers, Messrs. C. A. Parsons & Co., and the British Westinghouse Co. for plant, and from Messrs. Ferranti for switchgear. The Committee is to be authorised to place the necessary orders for the work up to £40,000. With reference to the necessary extension of steam-raising plant, a loan of £28,000 is to be raised, to be expended as follows:—Messrs. Babcock and Wilcox's tender, £25,140; water-softening plant estimate, £600; wages, contingencies, insurance, inspection, &c., £2,260.

Newport (Mon.).—YEAR'S WORKING.—The annual report of the Corporation electricity undertaking for the year ended March 31st last shows that the receipts amounted to £54,125 and the working expenditure to £32,092, leaving a gross profit of £22,033, which was rather more than the previous year's figure of £20,935. Allowing for accrued interest, &c., and deducting interest and sinking fund charges, war allowances, and other items, there remained a deficit of £273 as compared with a deficit of £933 in 1915-16. The energy sold for all purposes amounted to 6,383,801 units, compared with 5,015,074 in 1915-16. The maximum load was 3,268 kW. and the load factor 22.3 per cent.; 3½ lb. of coal were used per unit generated. The total all-in costs per unit sold was 2.11d., and the average price obtained 2.10d. per unit. The coal cost per unit generated was 338d.

Rathmines (Dublin).—A threatened strike of the Council's employees on a wages demand led to a notice being issued last Friday that it might be found necessary to discontinue the supply of electrical current. Fortunately, however, an arrangement was come to by which the Council is in future to pay the standard rates observed by other Councils in Co. Dublin.

Sligo.—ASYLUM LIGHTING.—In a discussion at the committee as to the lighting of the asylum, Mr. Scott, architect, said they could not at present install electricity, but Mr. Cregan pointed out that installations had been made in neighbouring towns.

Slathwaite.—PROV. ORDER.—The T.D.C. has received a communication from the Huddersfield T.C. that the B. of T. would not allow the Corporation's application for a prov. order for electric lighting for Slathwaite to proceed in the ensuing session, owing to the political situation.

Swinton and Pendlebury.—PRICE INCREASE.—At a meeting of the T.C. last week it was announced that the price of current to consumers would be increased by 5 per cent.

Windsor.—PRICE INCREASE.—On the ground that the application is justified, the T.C. has consented to the Electrical Installation Co., Ltd., charging 81 per unit for electricity supplied, subject to the matter being re-considered at the end of one year.

TRAMWAY AND RAILWAY NOTES.

Clitheroe.—The R.D.C. has approved of a proposal to construct a light railway from Longridge to Hellifield. It was stated that the line would cross the Council's road six times, and it was proposed to have four level crossings. It is expected that the line will be of great benefit to the district, as it will relieve the road traffic considerably.

Glasgow.—At its last meeting, the Tramways Committee had under consideration the position of the Corporation tramway undertaking and other tramway undertakings in Scotland in relation to the Tramway Committee recently appointed by the B. of T., along with a letter from the Paisley District Tramway Co., and has resolved to protest against the constitution of that Committee, on the ground that Scottish tramway undertakings are not represented by any person resident in Scotland, or familiar with the working conditions of these undertakings, and to ask for the appointment of a Scottish representative. The Committee appointed a Special Sub-Committee to take steps, in conjunction with other tramway undertakings in Scotland, with a view to bringing pressure to bear upon the B. of T. to have Scottish tramway undertakings represented on the Committee.

ACCIDENT.—Colonel Pringle, Chief Inspector to the B. of T., conducted an inquiry, on December 13th, into the circumstances attending the tramway accident the previous week, in which three persons were fatally injured and about 40 persons were hurt. Evidence given by tramway officials was to the effect that on the track at the point where the accident took place—a curve at the entrance to Queen's Park—a safe speed would have been five to six miles per hour. Above that speed there would be a tendency for the car to leave the track. There was no B. of T. stop before the curve, but there was a Corporation stop immediately after the curve; the track was in good condition. The driver of the car, a youth of 16 years and 5 months, said he was driving car 157 on the day of the accident for the first time. He did not think that the road at that point was sufficiently lighted, and the result was that he was on the curve before he was actually aware. Approaching the curve he had fed up to full power, and immediately switched the power off. He applied the hand-brake about 20 yards from the curve, but as it had apparently no effect, he released it, and then applied the magnetic brake. Witness gave it three notches, but as it, too, appeared to have no effect, he applied the magnetic brake to the full notch. Half way round the curve the two inner front wheels raised and the outer wheels left the track, and the car ran across the roadway and turned over. On the curve the car was going about four miles an hour. He thought the accident was due to the high speed of the car. Mr. Lachlan Mackinnon, the traffic superintendent, said the Government had offered to send them 105 men back from the Army in return for a similar number of men fit for military purposes. The Tramways Department had kept their side of the bargain, but, up to the present, they had received only six men from the Army. Three great essentials in a motorman were physique, intelligence and temperament, and while they did not get the physique in the lads they were employing as motormen they got intelligence. Temperament, however, was a matter in which they had to make their selection. It was only within the last few months that they had experimented with lads. The Tramways Department was badly hit by the abolition of the leaving certificate in October. Since then they had lost 64 men and 47 women, all skilled drivers, and although they had 800 women trained as drivers, only 258 were working. It required a particular type of woman for driving. The discipline in the service was not so good as it was before the war, and he attributed that to the ease with which people could leave their employment and obtain work elsewhere, and also to the lack of sufficient supervision, there being now only some 50 per cent. of the pre-war number of inspectors on duty. Colonel Pringle indicated that he would give his report later.

Lancashire.—CHRISTMAS DAY SERVICES.—The Burnley Corporation tramway employees have decided in favour of ceasing work on Christmas Day; a similar decision has been given by the Bolton tramway men.

London.—L.C.C. STAFF REORGANISATION.—The Highways Committee has considered the report on the electrical branch of the Council's tramways by the Special Sub-Committee on Tramway Organisation, and has submitted proposals for the appointment of an assistant electrical engineer at a salary of £600 per annum, rising to £800; also a senior technical assistant at £350 a year, rising to £500. The Committee is informed that in comparison with the large power station at Manchester, the Greenwich power station is understaffed, and recommends the appointment of an assistant power-station engineer at a salary of £400, rising to £500 a year; also that the position of senior charge engineer be abolished, and that an engineer with the designation of repairs superintendent be appointed to take charge of the whole of the repair work, at £300, rising to £400 a year; also that an additional charge shift engineer be appointed at £250 a year, rising to £300, and that the fixed staff of the Tramway Department be increased by two sub-station superintendents at £250 per annum, rising to £350; two sub-station repairs inspectors at £200, rising to £250 a year. The additional expenditure involved by the proposals is estimated at £1,655, and ultimately £2,905 a year, and the Committee is satisfied that economies in working costs will outweigh the additional expenditure.

The Highways Committee reports that the various concessions to traffic employees indicated by the recent award of the Court of Arbitration will cost £21,000 for the remainder of the year and

£40,000 in 1918-19. The Committee proposes to re-issue the tramway map and guide, and recommends the expenditure of £1,500 on publicity matters during the remainder of the year.

Newport (Mon.).—YEAR'S WORKING.—During the year ended March 31st last the Corporation tramways carried 11,456,530 passengers and ran 910,020 car-miles, these figures comparing with 10,017,515 passengers and 921,133 car-miles in the previous year. The total income amounted to £50,935, and the working expenses to £31,993, leaving a gross profit of £18,942, as compared with £14,679 in the previous year; after meeting income-tax and sinking-fund charges, there remained a net profit of £8,611, as compared with £5,409 for 1915-16.

Sunderland.—The T.C. has decided that no cars shall run on Christmas Day, and that the day shall be granted as a full holiday for all employees, but without pay.

Weston-super-Mare.—The promoters of the Weston-super-Mare Junction Light Railway have applied to the B. of T. for an extension of time until December 31st, 1918, for the completion of the unconstructed light railway authorised by the Order of 1910.

Wharfedale.—**RAILLESS TRACTION.**—A Conference of representatives of the local Councils of Otley, Gwiseley, Burley-in-Wharfedale and Menston, at Otley, last week, decided to approach by interview Mr. Daggett, acting manager of the Leeds Corporation Tramways, with a view to obtaining better facilities on the Wharfedale railless traction system run by the Leeds undertaking.

Wigan.—**ACCIDENT.**—On Saturday last a car started away from the Pemberton terminus, without the driver, and ran away down a steep gradient, finally leaving the metals and wrecking a house. A lady passenger was killed and three persons were injured, one being in the house.

TELEGRAPH AND TELEPHONE NOTES.

Spain.—It is reported from Madrid that the Spanish Naval Authorities have decided to proceed at once with the fitting of all naval vessels of over 500 tons with wireless telegraph apparatus.

Storm Damage.—Considerable damage to telegraph and telephone wires by weight of snow was done during Sunday and Monday last, when there was heavy snow and high wind in the West Riding. At Yeadon there was some trouble, owing to telegraph poles and wires having been blown down and weighted so far to one side as to be nearly touching the tramway trolley-wires. Railway traffic was held up for a time between Low Moor and Cleckheaton, owing to telegraph poles and wires being brought down over the permanent way. Many wires were down on the bleak hills surrounding Bradford.

Women for Wireless Work.—Well-educated women are wanted immediately for training on urgent Government work in connection with wireless apparatus. Candidates must be between 18 and 40 years of age, and prepared to pass a medical examination. Preference will be given to women with scientific training up to the London Intermediate Standard and some knowledge of practical physics. The course of instruction will be given in the Electrical Laboratories at the Polytechnic, Regent Street, and will last for about six weeks. During this period a weekly maintenance allowance of 25s. is payable. Further particulars can be had from the Director, Training Section, Ministry of Munitions, 6, Whitehall Gardens, S.W. 1.—*Daily Chronicle*.

CONTRACTS OPEN AND CLOSED.

OPEN.

Argentina.—February 23rd, 1918. Rosario Municipality. Establishment of telephone service within the municipal radius. Conditions on application.

Bolton.—January 15th. Electricity Committee. One 7,500-kw. turbo-alternator with condensing plant. See "Official Notices" December 7th.

Keighley.—January 9th. Electricity Department. Induced draught plant. See "Official Notices" to-day.

Spain.—Tenders have lately been invited by the municipal authorities of Cassa de la Selva (Province of Gerona) for the concession for the electric lighting of the town during a period of five years.

Tipperary.—January 11th. New battery for the Union electric lighting plant. See "Official Notices" to-day.

CLOSED.

Glasgow.—The Electricity Committee has accepted the following tenders in connection with the new generating station at Dalnarnock:

Steel work, &c., for roof over turbine house, beams for covering of water culverts, covering of pump chambers, and crane and transporter rails. Redpath, Brown & Co., Ltd. £10,885.
Two travelling cranes: Vaughan Crane Co., Darlington. £5,056 and £1,542 respectively.
Two 1,500-kw. transformers: Ferranti, Ltd. £4,236.

London.—**STEPNEY.**—Electricity Committee. Tenders recommended:

One 1,000-kw. rotary converter. Bruce Peebles & Co., Ltd. £3,580.
Water softening plant. W. Bady. £26.

FORTHCOMING EVENTS.

Junior Institution of Engineers.—Friday, December 22nd. At 8 p.m. At 31 Victoria Street, S.W. 1. Paper on "Water Circulation in Boilers," by Mr. H. Josling.

Friday, December 21st. At 31, Victoria Street. At 8 p.m. Paper on "Some out-of-the-way Engineering Jobs," by Mr. R. H. Parsons.

Royal Institution of Great Britain.—Saturday, December 29th. At 3 p.m. At Albemarle Street, Piccadilly, W. 1. Christmas Lecture, "Our Useful Servants: (1) Magnetism and Electricity." Tuesday, January 1st, (1) "Electricity and Electric Currents," by Prof. J. A. Fleming, F.R.S.

OUR HALF-YEARLY INDEX.

As it is necessary to effect every possible economy in paper consumption, the Index to Vol. 81 of the ELECTRICAL REVIEW, which will be printed in the course of a few weeks, will be supplied only to those who, through the post, specially apply for it. To such it will be supplied for 3d. post free. Any reader or advertiser at Home or Abroad who requires a copy for binding, or for other purposes, is asked to make application therefor promptly to: The Publisher, ELECTRICAL REVIEW, 4, Ludgate Hill, London, E.C. 4.

NOTES.

Foreign Trade.—**NOVEMBER FIGURES.**—The official returns of imports and exports during last month contain the following electrical and machinery figures:—

		November, 1917.	Inc. or dec.	11 months, 1917, Inc. or dec.
IMPORTS.				
Electrical goods	...	123,067	— 10,581	— 224,830
Machinery	...	1,029,510	+ 101,241	+ 701,048
EXPORTS.				
Electrical goods	...	209,217	— 100,552	— 1,104,535
Machinery	...	1,472,375	— 417,056	— 369,732

Birmingham Corporation Electrical Employees.—With reference to the note in our last issue on the threatened strike of E.T.U. members in Birmingham Corporation Electric Supply Department, we have pleasure in printing the following important statement which was published in a Birmingham newspaper, on December 10th, bearing the signature of Mr. P. J. Burgess, the hon. secretary of the Midland Electric Power Supply Engineers' Association:—

"In view of the public statement made by Mr. Beardmore on behalf of the Electrical Trades Union that the shift engineers at the generating stations of the Birmingham Corporation Electric Supply Department are coming out on strike if the Electrical Trades Union demands are not acceded to, I beg to state that all the shift engineers are members of the Midland Electric Power Supply Engineers' Association, and Mr. Beardmore has no authority for his statement. I should like to take this opportunity of saying that these methods do not appeal to the members of this Association, and I should be glad if you would give this letter equal prominence with that of Mr. Beardmore's pronouncement."

Workmen's Brains.—At a conference of the City Livery Companies on Reconstruction, Dr. Addison said it was important that craftsmen should be induced to apply their brains and energy to inventions and new adaptations. For that they must be secured and protected in the rights and benefits which would legitimately follow the adoption of their ideas. All manner of ingenious suggestions had been made by foremen and craftsmen during the war. Emergency might have produced the suggestions, but at the back of men's minds there seemed to be a timidity lest, having promoted something useful, they would not get anything out of it. That must be guarded against if in the future they were to make the best of the minds and experience of the skilled craftsmen of the country.—*Daily Chronicle*.

The Ramsay Memorial.—The hon. treasurers of the Ramsay Memorial Fund have now received donations or promises amounting to £25,011, out of the £100,000 at which they aim. A co-operating Committee in Glasgow, Sir William Ramsay's birth-place, has already raised nearly £2,000. Branches have been formed also in Australia, Canada, India, New Zealand, the United States of America, Chile, Denmark, France, Holland, Italy, Japan, Norway, and Switzerland.

The fund will be devoted to Chemical Research Fellowships and a Laboratory of Engineering Chemistry. The hon. treasurers are Lord Glenconner and Prof. J. Norman Collie, University College, London, W.C. 1.—*The Times*.

An Air Inventions Committee.—Under the direction of Lord Rothermere, an Air Inventions Committee has been set up, and will be in operation immediately. The Committee is as follows:—Mr. Horace Darwin, chairman; Major-General Luck, vice-chairman; Sir Dugald Clerk, Sir Richard Glazebrook, Prof. H. L. Callendar, Prof. C. H. Lees, Prof. J. E. Petavel, Mr. L. Baird, Lieut.-Commander Wimpey, R.N.V.R., Major G. I. Taylor, R.F.C., Capt. B. M. Jones, R.F.C., Capt. A. V. Hill (Munitions Inventions Department), Mr. J. P. Millington, and Mr. F. W. Lancaster.

The functions of the Committee will mainly be to investigate all inventions submitted to it, and to develop and put into operation as soon as possible any invention which at all promises to add to the efficiency of aircraft. Communications regarding inventions or ideas should be forwarded to the Air Inventions Committee, No. 2, Clement's Inn, W.C. 2.—*Daily Telegraph*.

Prospects for Electrical Engineers in India.—In the course of an address given by the Electrical Engineer, North-Western Railway, to apprentices on the occasion of the opening of electrical classes which have been lately started, reference was made to the careers which were open to them when their apprenticeship with the railway was completed. Their chief object immediately at the end of their apprenticeship should be rather to enlarge their experience and increase their knowledge than to settle down on the railway on works which would teach them nothing and lead to very little except the chance of a vacancy in one of the few positions worth having after a number of years. The Electrical Engineer's advice to them all, therefore, was to look for employment outside the railway when the time came. Those who were able to arrange it were recommended to proceed to England for a short course of training at the close of their apprenticeship: it was worth making a considerable sacrifice to spend a little time in a country where the very latest and most up-to-date methods were in use.

They would be more useful in India at the close of their training than in England, and would be worth far more money on their return to India. The railways were always extending their electrical works; some had their own power stations, and their shops were electrically driven. On any railway, however, there were not likely to be more than two or three positions which were well paid, or which should be looked on as a permanency by any one with ambition.

The various electricity supply undertakings in India had increased in number considerably during late years, and were likely to continue doing so as time went on. There were various jobs—such as shift engineers and chargemen—to be obtained on these; but they were like similar appointments on the railway, not worth having, and would only give experience which they already possessed. There was no reason, however, why any of them should not aspire to the managership of, at all events, the smaller of such undertakings, or the position of chief assistant of the larger ones.

Very few of the larger collieries in Bengal were now without their electrical installations, on which, in many cases, the whole working of the colliery depended. The working of these installations was so important, therefore, that most collieries of importance could afford an electrical engineer, who was fairly well paid, and, in many cases, an assistant, who had always the possibility of stepping into his place, either temporarily or permanently. Electrical engineers of mills very rarely held positions of any importance, unless the mills were worked electrically; and, even then, they were only in the position of shift engineers.

There were various Government appointments in the different Provinces. Under the Electricity Act, there had to be electric inspectors appointed in all the larger Provinces, who had rather special duties, requiring common sense rather than deep electrical knowledge, and in several cases these officers were also electrical engineers to their respective Governments, and had charge of all the Government electrical works in the Province. There was no reason why they should not qualify themselves for any of these appointments. In larger Provinces these officers usually had assistants who were fairly well paid, and these were the positions which they should endeavour to obtain, to qualify for the better position of chief, later on.

Many of the native States had their own Electrical Engineers, and some were well-paid appointments. These had certain disadvantages, but the possibilities of lucrative employment in the native States were certainly increasing, and in a State such as Mysore the positions obtainable were comparable with the best which might be looked for in British India.

In many ways the most attractive of all positions filled by electrical engineers in India were those to be filled in commercial electrical engineering. Their possibilities, financially, were far greater than those of any of the positions previously enumerated. All the posts open to the electrical engineers in India which had been mentioned had limitations as far as salary to be earned was concerned: in commercial life there was no limit to what a man

might earn or make. It was the only career in which a competent man could demand and obtain his own value.

The greatest merit a man could have was that of doing his work as cheaply as possible, bearing in mind, however, that this cheapness was always secondary to doing first-class work.

It was competition that made really commercial engineers so valuable to their employers. In competition the firm who could carry out work cheapest (always understood that it was first-class work) would always win, and this was the secret of success of great firms in the world to-day. The firm who could carry out work cheapest would always have the best employes, and these employes could make themselves so indispensable that they could determine their own salaries.

To qualify for, and obtain, such positions as were worth having, let them never be satisfied with any work which was mechanical, or entailed the same duties day after day. These positions were never paid well, because they required little brain work; it was brain work which was paid for all the world over.

They should use their brains as much as possible, because it was only by constant use that brains were developed, and take every opportunity of improving their minds in every possible way.

When they came to the end of their apprenticeship, experience and further knowledge was what they required, to enable them to qualify for better paid positions later on. Let them not, therefore, stay in any job when they had learnt all there was to learn in it, unless they saw a further opening enabling them to learn more, which it would lead to.—*Indian Engineering*.

Educational.—**EAST LONDON COLLEGE** (University of London).—A preliminary course is being commenced in Science and Engineering for young men between 17 and 18 years of age desirous of entering the Royal Air Service. The course includes aeronautics, physics, electrical engineering, applied mechanics and engineering drawing, and aeroplane engines.

Sterling Football.—The Sterling Athletic and Social Club (Sterling Telephone and Electric Co., Ltd.) have finished the first half of the season undefeated, with a record of seven games won out of eight, one being drawn, and scoring 36 goals to 6. On Saturday last, after a grand game, they defeated the undefeated and smart Ipswich Ladies by 3 goals to nil.

A collection at the Sterling Works, Dagenham, on behalf of the Overseas Club Tobacco Fund realised over £35. Mr. Guy Burney, the managing director (who, with Mr. Chas. E. Sherwood and Mr. E. Cholerton, headed the list), has written a letter of congratulation to the subscribers and collectors upon the result.

The I.E.E. and the Non-Ferrous Metals Bill.—The Council of the Institution of Electrical Engineers has passed the following resolution, which has been transmitted to Sir Albert Stanley:—"That the Council of the Institution of Electrical Engineers welcomes the Non-Ferrous Metals Bill, approves its principles, and congratulates the President of the Board of Trade on its introduction. The Council, representing an Institution whose members are interested so widely in the supply of non-ferrous metals, unanimously supports this measure designed to keep the control of the supply of these essential metals in British hands."

Electrolytic Zinc in Utah.—The process used by the Judge Mining and Smelting Co., Park City, Utah, for the production of electrolytic zinc is briefly outlined by Mr. C. A. Hansen in the recent annual report of the company. The zinc concentrates produced at the company's concentrator contain some lead and silver. They are treated first in a Wedge roasting furnace. The roasted ore is then leached by agitation with an 8 per cent. sulphuric acid solution in Deveroux tanks. The leach-tank product is discharged to classifiers for the removal of the coarse insoluble material. The solution and fine suspended solids which flow from the classifier are treated in a Dorr thickener, the underflow from which is sent to an Oliver filter. The coarse and fine solids thus recovered from the classifier and filter are sold to lead smelters for the recovery of lead and silver.

The leach liquor contains impurities in the form of copper and cadmium which are dissolved from the ore, and these are removed before the zinc is recovered. The removal of impurities is accomplished by passing the liquor through tube mills filled with zinc shot on which the copper and other metals are precipitated in spongy form. The solution flowing from the tube mills is filtered, and is then ready for treatment in the electrolytic cells.

The cell room contains 120 cells arranged in two groups of 60 each. Each group is served by a generator delivering 5,000 amperes at 250 volts. Each cell carries 12 aluminium disks, 5 ft. in diameter, mounted on a rotating shaft. Alternating with the aluminium cathodes are 13 lead anodes, which are supported independently of the shaft. Zinc is deposited on the rotating cathodes, and in the course of about three weeks each cell of 12 disks collects about 5,000 lb. of zinc. The loaded shaft is removed, the zinc stripped, and the shaft reassembled for return to the cell. The electrolytic zinc is melted, cast into cakes, and marketed. The electrolyte is again used in leaching roasted ore.—*Met. and Chem. Engineering*.

Lighting Restrictions in America.—According to a Renter dispatch from Washington, the Fuel Administration has decreed that "lightless nights" are to be observed once a week, not only for the purpose of saving coal, but also "to provide startling and visual evidence that the United States is engaged in the conduct of the greatest of world wars."

A Steel Patent Revoked.—In the Chancery Division, on Monday, Mr. Justice Younger delivered his reserved judgment in the matter of the petition by Arthur Balfour & Co., Ltd., Darnley Steel Works, Sheffield, for the revocation of Letters Patent No. 27,838 of 1912, granted to Stahlwerk Becker A.G., of Krefeld Willich, Germany, in respect of an invention for an improved high-speed tool steel. The petition was based upon the ground of prior user and want of novelty. The invention consisted in the addition of cobalt up to 15 per cent. to the other ingredients of high-speed steel, and petitioners said they had been in the habit of using cobalt for at least 12 months prior to the date of the patent. Counsel said the invention was one of vast importance, and revolutionized the production of this class of steel. The respondents were the German patentees, and Darwin & Milner, Ltd., of Commercial Street, Sheffield, who claimed to be the licensees under the patent.

His Lordship said the sole question he had to determine was whether the objections to the validity of the patent had been established, and he came to the conclusion that they had. He, therefore, made an order revoking the patent, but granted a stay for six weeks, in order that the patentee in Germany might be communicated with.—*Financial Times*.

The Non-Ferrous Metal Industry Bill.—This Bill was before the House of Commons in Committee, on Tuesday. There was a good deal of discussion on an amendment which sought to limit the application of the Bill so that only persons suspected of enemy association would be obliged to apply for a Board of Trade licence, but the amendment was rejected by 148 votes to 80. Sir A. Stanley said that the sole object of the Bill was to secure that those engaged in the metal industry were not under German control, and, in order to effect that, everybody in the trade must apply for a licence. Another amendment sought to make the licence inoperative for six months after the end of the war, as the Government had absolute control over the metal industry, and would continue to have such control for such time. Sir A. Stanley said they must take steps to secure the break up of the German combination, so far as concerned this country. The effect of the amendment would be that we might be, during the difficult period following peace, unable to meet the demand for metal, while the German combination would be ready to resume operations. Mr. Runoiman agreed that whatever steps were to be taken must be taken at the earliest possible moment. The amendment was rejected by 165 votes against 68.

An Electric Steel Furnace on the Witwatersrand.—In the *South African Journal of Industries*, Prof. G. H. Stanley, of the South African School of Mines and Technology, gives particulars of the manufacture in Johannesburg of steel shoes and dies for stamp batteries. Prior to the outbreak of war all such material was imported, and of these particular articles about 7,500 tons per year are used for renewals. Without them it would be impossible for the milling of gold ore to continue, and, consequently, the difficulty of importation, as the result of the war, became a matter of grave concern. Moreover, they are made of high-grade steel and by highly skilled workmen, and both the material and the men are required to-day for other purposes. The enhanced price—£35 per ton, as against the pre-war price of £18 10s., has converted a somewhat doubtful proposition into an extremely attractive one. A Committee of the Chemical, Metallurgical and Mining Society, the Institute of Engineers, and the Institute of Electrical Engineers, was constituted to inquire and report on the possibility of local production, and, as a result, the Chamber of Mines, through the Witwatersrand Co-operative Smelting Works, Ltd., furnished the necessary capital, estimated at £5,000, and appointed a Committee of technical men to carry out the scheme. The erection of the plant was commenced in May of last year, and current was switched on on September 3rd, 1916. The total production to the end of July, 1917, was 360 tons. The furnace adopted is an electric induction furnace of the Kjellin type, several reasons contributing to its selection; all the material and machinery required were available in the country for the construction of a furnace of a useful size, the material available for melting—worn and discarded shoes and dies—required no refining, but merely melting and casting, electric heat would cost much less than that from coke, and no electrodes, which would have to be imported, were required. Up to 600 amperes at 250 volts is used in the primary coil, inducing about 30,000 amperes in the metal. The electric current available direct from the mains of the Victoria Falls and Transvaal Power Co. was not suitable, being at 2,000 volts, three-phase, 50 cycles. This is transformed for the furnace by a rotary transformer set consisting of a motor coupled to two generators, all being adapted from other purposes by Prof. Buchanan by means of considerable alteration and re-winding, to give single-phase current up to 600 amperes, at 12 cycles. The furnace is built of South African fire-brick of special shape, lined with calcined magnesite, obtained, in the first place, from Maléane, and used first as a source of carbon dioxide for mineral water manufacture. The imperfectly calcined material resulting is then burnt at a high temperature in a special gas-fired furnace, mixed with clay and heric acid and wetted, and rammed into place round a wooden template. The scrap metal, already heated to redness in a coal-fired reverberatory furnace, is charged in little by little till the furnace is fully charged with molten steel, which takes about six hours, after which for an hour or so, the metal is allowed to get hotter and "kill," during which it becomes to some extent purified, and certain dissolved gases are expelled. During melting, oxidation is prevented, as far as possible, by keeping the molten bath covered with charcoal; nevertheless, some silicon and manganese are lost, and, to replace these, a calculated amount of pure pig-iron and manganese steel scrap is added

at the end. Finally, slag is skimmed off, and the metal is tapped out into a vessel in front provided with a lever-operated clay-stoppered outlet below, from which the molten steel flows into the moulds, which—mounted on wheeled carriages—are run underneath. The moulds used are made of thick cast-iron, in two sections, hooped together, and provided with rammed sand tops—these being dried in a stove heated by the same fire as the pre-heating reverberatory before mentioned. After solidification, the casting head and fins are trimmed off, and every shoe and die produced is weighed and numbered. Usually between 1,900 and 2,000 lb. of castings are obtained per heat, and the production for July was 73 tons. The imported shoes and dies are forged in manufacture, and the local ones are merely cast to the desired shape. The users—the co-operating mines—keep records of their performance in comparison with the imported, and the result is satisfactory, in some cases the local having an even longer life than the imported ones. In spite of high costs of labour and other items, the plant operates very profitably.

Legal.—OSRAM-ROBERTSON LAMP WORKS v. ELECTRICAL ENGINEERING AND EQUIPMENT CO.—Mr. Hunter Gray, on Tuesday, applied to Mr. Justice Eve for his approval of the minutes of agreement arranged between the Osram-Robertson Lamp Works and the Electrical Engineering and Equipment Co., Ltd.

His Lordship: I take it that everything is in order?

Mr. Hunter Gray: Yes, my Lord.

His Lordship: Very well then.

ATTORNEY-GENERAL v. THE METROPOLITAN BOROUGH OF HACKNEY.—In the Court of Appeal, on Tuesday, judgment was delivered dismissing the appeal in this case, with costs. We shall report the judgment in our next issue.

Volunteer Notes.—COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).—Headquarters, Balderton Street, Oxford Street, W. 1.

Orders for the week, by Lieut.-Colonel C.B. Clay, V.D., commanding:—

Officer for the Week.—Second Lieut. E. A. Ullmann.

Christmas Holidays.—Headquarters and the Range will be closed from the 22nd to the 28th, both inclusive.

Saturday, December 29th.—Commandant's Parade at Headquarters, 2.45 p.m., for Route March and Drill. Uniform to be worn.

A, B, and C men are reminded that one route march per month is compulsory.

(By order) MACLEOD YEARSLEY, Capt. and Adjutant.

National Insurance (Part II) (Munition Workers) Act, 1916.—The following are further decisions of the Umpire. Contributions are payable in respect of:—

2,399 X. Charge-room attendants employed wholly or mainly by way of manual labour in connection with any insured trade or munitions work.

2,404 X. Workmen engaged wholly or mainly in making leather parts of cycle and motor-cycle saddles.

2,406 X. Workmen employed wholly or mainly in the workshops of local authorities and engaged in painting iron seats, street orderly bins, or other metal goods.

Appointments Vacant.—Armature winder, for the Oldham Corporation tramways; charge engineers, for the Derby Corporation Electricity Department; Head of the Department of Electrical Engineering and Physics, for the Victoria Jubilee Technical Institute, Bombay (700 Rs.); shift engineer (52s. 6d.+) for the Maidstone Corporation Electricity Department. See our advertisement pages to-day.

Institution and Lecture Notes.—Institution of Mechanical Engineers.—On Friday last a paper was read on "The Use of Soap Films in Solving Torsion Problems," by Messrs. A. A. Griffith and G. I. Taylor. The authors point out that the equations which represent the torsion of an elastic bar of any uniform cross-section are identical in form with those which represent the displacement of a soap film due to slight pressure, when stretched over a hole in a flat plate, of the same shape as the cross-section of the bar, and show how this fact can be applied to the solution of technical problems, very many of which are not amenable to analytical treatment. The method is most ingenious, and is admirably handled by the authors; it will, no doubt, prove of immense value in practice.

Institution of Electrical Engineers.—In the December issue of the *Journal* it is announced that Prof. A. Righi, of Bologna University, has been elected an Honorary Member of the Institution, and that the Committee of the Privy Council for Scientific and Industrial Research has made a further grant of £670 to the Institution towards the cost of the research into the properties of insulating oils. A list of 10 of the Committees appointed by the Council for 1917-18 is given, including also 11 Sub-Committees and Panels in connection with the Research Committee. The Committees on "Ship Electrical Equipment" and "Wiring Rules" include a number of representatives appointed by other societies. The eighth Roll of Honour comprises seven names, and the eighth list of Military Honours awarded is given, with the thirteenth list of members on military service.

Royal Institution.—On Thursday next Dr. J. A. Fleming will give the first of his course of Christmas lectures on "Our Useful Servants: Magnetism and Electricity," dealing with magnets and the magnetic compass. On Saturday he will take up the subject of electricity and electric currents.

The Faraday Society.—A general discussion on "The Setting of Cements and Plasters" will be held on Monday, January, 14th, 1918, at 5.30—7 and 8.30—10.30 in the Rooms of the Royal Society of Arts, John Street, Adelphi, London, W.C. 2.

Electrically Heated Beds.—A warm bed is the most important matter for a patient suffering from pneumonia. If the aim is to maintain an even temperature, it is obvious that any system of intermittent heating is very unsuitable for the purpose; at best with the rubber hot-water bottle the bed temperature is a constantly fluctuating quantity. Various efforts have been made to solve the problem by the use of a continuous electric current passed through suitable resistance, but these have failed for the most part in not providing for the wear and tear inseparable from bed-using and bed-making. A successful solution has now been reached by Mr. H. J. Gauvain at the Treloar Cripples' Hospital, Alton, where two wards are supplied with electric mattresses which have proved both safe and convenient in practice even when a child is the occupant of the bed. The mattress does not differ in appearance from any other except that a flexible wire enters it at the head end through a terminal, which is flush with the surface and therefore not exposed to injury. The resistance wire is insulated by glass beads in flexible metallic tubing incorporated in the substance of the mattress. The mattress is differentially heated, and the heating element is so disposed that the maximum warmth is generated at the foot end, less in the middle, and none at all at the head end. This distribution of heat is maintained in whatever position the mattress is turned, either from head to foot or side to side. The wires are connected with a switchboard on the wall at the head of a bed, which contains a variable resistance, so that the current can be graduated to any required extent. It is so arranged that when the current is full on, the temperature of the bed is raised 25° to 30° F. above that which would obtain apart from the heating, and this has been found in practice to meet the needs of the small cripples, many of whom are fastened on splints which do not allow of the close contact of the bed clothes. A fuse prevents the passage of any current exceeding this amount. Several of the usual difficulties have thus been met; the temperature of the mattress cannot rise to any dangerous degree, the tubing is so flexible that the mattress can be shaken or rolled up, and the resistance wire is waterproof in the spiral metallic tubing, so that no short-circuiting results, even if the mattress is wetted. The mattress may be sterilised in the ordinary way. The system is equally applicable whether the bed be in or out of doors. The saving of time at the Cripples' Hospital amounts to an aggregate of three hours a day in each ward where the electric mattress has replaced the filling of hot-water bottles, while inasmuch as the current required for maximum heating is only half an ampere at 110 volts, the total expenditure for energy of 200 or more beds would be by no means prohibitive. We believe that the general adoption of a similar appliance in hospitals and infirmaries would save much time and relieve the nursing staff of a tiresome routine. Electrically heated beds have already been found of advantage in the treatment of shock at field hospitals, and for military purposes it will be seen that the current required may be instantly supplied from a portable dynamo driven by a motor lorry or car attached to a field hospital. This is of especial importance in circumstances where water for hot-water bottles is not readily available and the means of heating the water required is limited.—*Lancet*.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—The General Purposes Committee of the Stepney B.C. recommends that at the meeting of the Council in March next the following resolution be considered and determined, viz.:—That Mr. F. Tait be transferred to Class I of the Council's Grading Scheme as from January 1st, 1918, at a salary of £312 10s. per annum, rising by annual increments of £12 10s. to £400 per annum.

Buxton T.C. has appointed Mr. AUCHER BISHOP, of Maidenhead, as assistant electrical engineer, at a salary of £150 a year.

Mr. PHILLIPS, borough electrical engineer at Bedford, having accepted a commission in the R.F.C., the T.C. has appointed Mr. H. B. JENKINS acting borough electrical engineer at £275 a year, and Mr. R. J. BLAICH as consulting engineer at the same salary.

The Manchester Tramways Committee has given its approval to the transfer of the services of its general manager, Mr. J. M. McEHOY, from the Admiralty to the Board of Trade, to serve upon the new committee of tramway experts. This was recently set up by the Board. The Admiralty reserves the right to call upon Mr. McEHOY for special services in connection with the department with which he has been connected since the beginning of the present year, and will also return to Manchester from time to time to deal with important matters connected with the tramways under its jurisdiction.

The Leeds C.C. Highway Committee recommends that Mr. J. P. WILSON, second-class assistant, be promoted to the position of senior electrical assistant (electrical branch) in 1918, at a salary of £350 per annum, and that Mr. J. B. WOOD, senior charge engineer at the same station, be promoted to be assistant power-station engineer at £400 per annum, rising to £500; that Mr. H. J. COOPER be appointed charge-shift engineer at Green-

wich power station at £250 a year, rising to £300; that Mr. R. S. GOOD, second-class assistant, be promoted to be sub-station superintendent in the tramways department (electrical branch) at £250 a year, rising to £350; that Mr. N. H. THOMAS, third-class assistant, become sub-station superintendent in the tramways department (electrical branch) at £250, rising to £350.

Stoke Newington B.C. General Purposes Committee recommends that Mr. H. LARGE, acting borough electrical engineer, be granted an addition of £20 to his present salary of £180 per annum, and £25 further on account of honorarium for his services as acting engineer, the latter to be paid in March next. The Committee also recommends increases varying from 2s. 6d. to 5s. per week to other members of the staff of the electricity department, and that, subject to the consent of the L.G.B., such of the officers and servants in the aforesaid department now on active service as are married men, and not holding commission rank, be granted a war bonus equal to that which would have become payable to them if they had continued to discharge their civil duties in the Council's employ.

General.—Mr. FRANK K. COOKE, who has rendered service for some 30 years with the Unbreakable Pulley & Mill Gearing Co., Ltd., has found it necessary, owing to illness, to sever his connection with the company. During the lengthy period mentioned he was secretary of the company for 23 years, enjoying the most happy relationship with them.

Stepney B.C. Electricity Committee has re-elected Councillor H. R. BARGE and Councillor W. F. BATE Chairman and Vice-Chairman respectively for the ensuing year.

Mr. H. SHAPE, on his retirement from the position of local secretary of the Tramway Workers' Association, has been presented with a gold watch by the employees of the Burnley Corporation tramways department, in which he was formerly employed.

It is announced in the Press that Sir JOHN WOLFE BARRY, owing to advanced age, has decided to relinquish his position as chairman of the Eastern & Associated Telegraph Companies, over which for many years he has presided, but those companies will continue to have the benefit of his services on their respective boards. Sir John Denison-Pender has been elected chairman.

Roll of Honour.—Captain F. B. F. HAIGREAVES, of St. Anne's, who is officially reported missing, was chief accountant to the Blackpool & Fleetwood Tramroad Co. at Bispham.

Second-Lieutenant C. L. MACDONNELL, Gloucestershire Regiment, killed in action on October 9th, 1917, was in the employ of the Bradford Corporation electricity department.

Lance-Corporal H. P. ARNOLD, R.E., who has fallen in action, was employed at the Rugby works of the B.T.H. Co.

Rifleman W. BROOKS, who was with Messrs. Johnson and Phillips, Ltd., of Charlton, S.E., is reported missing.

Private C. T. YEWEN, Queen's Royal West Surrey Regiment, who has been killed in action, was with Messrs. Creed, Bille & Co., of Croydon.

Private E. COOPER, of the Royal Welsh Regiment, who has been killed in action, was employed by the British Westinghouse Co. at Trafford Park.

The Mayor of Heywood last week publicly presented the D.C.M. to Sergeant THOMAS FEARING, East Lancs. Regiment. The award was made for conspicuous services at Gallipoli. Sergeant Fearing was mains foreman in the Bury Corporation electricity department.

Private G. W. LAMB, King's Shropshire Regiment, killed in action, was employed by the British Westinghouse Co. at Trafford Park.

Staff-Sergeant FRED WOODS, A.S.C., awarded the Military Medal, was a mechanical and electrical engineer in the employ of his father, Mr. J. Woods, Blackpool.

Private G. LEWIS, R.O.Y.L.I., who has been killed in action, was employed by Messrs. Hirsts, electrical engineers, Dewsbury.

Second-Lieutenant P. N. CUNNINGHAM, who has been killed, was the younger son of Mr. W. Cunningham, a director of the Etna Iron & Steel Co., Motherwell. Just before joining the Army he had taken his diploma in electrical engineering at the Glasgow Technical College.

Corporal H. FOSHER, formerly employed by the Newcastle Electric Supply Co., is in hospital wounded.

Obituary.—Mr. H. A. C. SAUNDERS.—We regret to record the death, which took place on December 8th, at his residence at Highbury New Park, N., of Mr. H. A. C. Saunders, late electrician-in-chief to the Eastern Telegraph Co., aged 85 years. The interment took place at Brompton Cemetery last Saturday.

Mr. E. MATHESON.—The death has taken place, at Dartmouth, of Mr. Edwin Matheson, aged 79. He was for many years an alderman on the Leeds City Council, and had been the chairman of the Electricity Committee and the Leeds Chamber of Commerce. He was also a member of the Inst.C.E. and of the Iron and Steel Institute, at one time being a managing director of the Farnley Iron Co.

Mr. W. JOHNSON.—The death took place suddenly, on December 8th, of Mr. Wm. Johnson, of Messrs. Wm. Johnson and Co., electrical contractors, of Sheffield. He was in his 74th year, and is described as one of the pioneers of the electrical industry in the city.

NEW COMPANIES REGISTERED.

Inventions (Manchester), Ltd. (119,111).—Private company. Registered December 11th. Capital, £3,000 in £1 shares. To acquire any patents, inventions, &c. The subscribers (each with one share) are:—M. H. Goldstone, Sampson Works, Salford, Manchester, electrical engineer; H. O. Farrell, 91, Sowerby Street, Moss Side, Manchester, electrical engineer. The first directors are:—M. H. Goldstone, H. O. Farrell, and J. Lightfoot. Registered office: 29, Princess Street, Manchester.

Surbiton Contract Co., Ltd. (149,128).—Private company. Registered December 13th. Capital, £40,000 in £1 shares. To enter into an agreement with Callender's Cable & Construction Co., Ltd., and to carry on the business of electricians, electrical and mechanical engineers, &c., also to carry out experiments and operations with a view to applying all or any part of the company's processes or preparations to the insulation of cables and wires, the prevention of corrosion, rust, or damp in articles exposed to water or air, &c. The subscribers (each with one share) are:—Th. Petersen, Hamilton House, Victoria Embankment, E.C., electrical engineer; F. E. Gripper, 11, Tophill Street, S.W., electrical engineer. The first directors are:—Thos. O. Callender, Theodor Petersen, Francis E. Gripper, and John C. Wigham (all British by birth). Qualification: One share. Remuneration as fixed by the company. Registered office: Electricity Works, Ewell Road, Surbiton.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Rapid Distillation & Power Co., Ltd.—Charge on company's interest in certain freehold land and premises at Barking, and in certain stock, plant, &c., dated November 27th, 1917, to secure all moneys which may be paid by W. G. Morden and C. W. Small under a guarantee of certain bank drafts.

Oriental Telephone & Electric Co., Ltd.—Satisfaction to the extent of £750 on December 4th, 1917, of £200,000 debenture stock secured by trust deed of 1905 and supplemental deed of 1907.

Telephone Co. of Egypt, Ltd.—Satisfaction to the extent of £1,597 on December 4th, 1917, of £200,000 debenture stock secured by trust deed of 1904 and three supplemental deeds.

CITY NOTES.

Mr. A. W. TAIT, presiding at the annual meeting on December 13th, said that the progress of the company during the last five years was undoubtedly satisfactory. After referring to the difficulties of the past few years, he said that one of the most important and progressive departments of their manufactures was that of steam turbines and turbo-blowers, and the orders which they had obtained for these during the year were decidedly satisfactory. He mentioned last year that the company had built turbines of over 5,000 kw. capacity, and that still larger units were being prepared. It was a tribute to the company's design and sound manufacture that they had secured an order for one of two of the largest turbine units for operation in this country. In these days of necessity for consolidation and efficiency in manufacture, the whole trend was for concentration in the development of electrical energy, so that industry might be supplied at as cheap a rate as possible. A committee appointed by the Government were looking closely into this matter with a view to centralising the power generation of the country in order to assist industrial development, and as the outcome of this there would be great scope for the steam turbine, particularly in the larger units. It was the intention of the directors to participate in this development, and to get their fair share of the business which would undoubtedly be available. The dry-gas cleaning plants which the company had manufactured and erected for important iron-works throughout the country had given every satisfaction. Developments in this department were encouraging, particularly in these days when the value of by-products was so closely studied. There was a wide field for plants manufactured under the patents held by the company, and, in addition to the orders which were on their books, there were large orders which were only held up owing to the present shortage of materials. The conveyor department was a growing business. The merchandise business in South Africa had been excellent. The trading in Australia, Canada, and at other branches had been necessarily restricted. Their office at Petrograd still remained open, but no new work was being undertaken at the moment.

Companies Struck Off the Register.—The following companies have been struck off the register, and are accordingly dissolved:—

Adjustable Cover & Boiler Block Co., Ltd.
Forced Lubrication Co., Ltd.
South African Engineer Co., Ltd.

F. Reddaway & Co., Ltd.—Dividend, 6 per cent. on the ordinary and preference shares for the year. £6,220 is put to depreciation, and £2,854 is carried forward.

British Westinghouse Electric & Manufacturing Co., Ltd.—The numbers have been advertised of 79 debentures of £100 each (6 per cent. prior lien) which have been drawn for redemption at par on January 1st, 1918.

Napier-Kimber, Ltd.—At the annual meeting, held on 6th inst., it was stated that the turnover for the year ended August 31st last showed a considerable increase, which was reflected in the profits, and after allowing for payment of debenture interest, depreciation of stock, bonus to staff, &c., a dividend of 10 per cent., free of income tax, is paid on the ordinary shares, and £957 is carried forward. A considerable increase in capital in the near future is contemplated, when Treasury sanction has been obtained, in order to deal with expanding business.

Ferranti, Ltd.—The annual meeting will be held on December 28th, at Basildon House, E.C., but the directors are unable to submit the accounts for the year ended June 30th, 1917, as several important matters in connection with Government contracts are not yet settled. The accounts will be submitted later.

Eastern Extension, Australasia & China Telegraph Co., Ltd.—Third quarterly interim dividend of 3s. per share, free of income-tax, in respect of profits for the year ending December 31st.

Manila Electric Railroad & Lighting Corporation.—Dividend of \$1.50 per share on the common stock for the quarter ending December 31st.

Automatic Telephone Manufacturing Co., Ltd.—The preference share and transfer books are closed until 25th inst., for the purpose of preparing the dividend warrants on the 6 per cent. cumulative preference shares for the half-year.

Anglo-Argentine Tramway Co., Ltd.—The directors have postponed the consideration of the payment of the dividend on the first preference shares until the accounts for the year are received.

STOCKS AND SHARES.

TUESDAY EVENING.

Stock EXCHANGE markets have dropped into a jog-trot condition, in which the prevailing factors are, as before, the issue of War Bonds and the news from abroad. The latter would have been less disappointing had it not been for the success previously achieved at Cambrai, with the subsequent ringing of joy-bells. The disappointment is reflected, so far as the Stock Exchange is concerned, in a slowing-down of business and a moderate set-back in prices, although in any case the latter was pretty sure to have come about as a natural sequel to the great push on behalf of the War Bonds.

The various transport markets, steam and electrical, lean to the down grade. Undergrounds are not in much worse state than they were, except that the sentiment for them is perhaps more chilly than it was before. The Underground Co.'s Income Bonds have fallen $\frac{1}{2}$ in spite of the demand that is arising again for investments the dividends on which are paid free of tax. The recent speech of the Chancellor of the Exchequer, forecasting heavier taxation in the New Year, has revived the quest for tax-free securities, and on the present basis of 81, the Underground Income Bonds return practically 5 per cent. net, assuming that the previous 4 per cent. rate is maintained. The bonds, of course, are entitled to 6 per cent., which they received a year or two ago, but the rate had to be cut in consequence of the increase in taxation, and with the fall in dividends came a corresponding reduction in price. The 5 per cent. clear, which is the present yield, is the equivalent of 6 $\frac{1}{2}$ per cent., less tax, and this is attracting a little notice from investors who are not afraid of home railway stocks.

Anglo-Argentine Tramway First Preference have again fallen back, this time to 23, there being some pressure to sell the shares on behalf of a deceased account. Whether this be the true reason or not, the market is certainly dull, and the price is now within 5s. of that of the Second Preference, which have received no dividend since December, 1915. The 5 per cent. debenture stock is steady at 65 $\frac{1}{2}$. Brazilian Traction keep about 46, and the preference at 90, the latter being recently ex dividend. Mexican Bonds of all kinds remain flat. Further falls have taken place in the bonds of the Mexico Tramways, the Mexican Light and Power, and the Pachuca Companies. In reply to inquiries as to why these should be so especially weak at the present time, authorities in the market aver that there was no particular reason why quotations should have been hoisted some time ago, and that those who bought the bonds at that time are now sick of waiting for the recovery which does not come, and are anxious to get out at practically give-away prices. The common shares of the Mexico Tramways are down to 32 $\frac{1}{2}$, and the company's bonds, both Firsts and Seconds, are exactly the same price. There is something ironical in the bonds and the common shares all footing the same line. Mexican Light & Power common are nominally 22 $\frac{1}{2}$, but shares changed hands a few days ago at 19 $\frac{1}{2}$. The preferred have fallen to 29, the 5 per cent. First Mortgage Bonds to 32 $\frac{1}{2}$, and the Seconds to 23 $\frac{1}{2}$, while Pachuca bonds are quoted at 30. The last transaction marked in the latter was at 40 $\frac{1}{2}$ a month ago, although the deposit receipts changed hands last Thursday at 33. British Electric Traction remain dull, the ordinary stock at 32 $\frac{1}{2}$, the preference

at 72½ x.d., while the First and Second Debentures are quoted 76½ and 65 respectively.

The cable market keeps good, and business is marked regularly in Eastern Telegraph Ordinary stock at 150 and over. Eastern Extensions changed hands freely between 14½ and a shade over 15. Westerns keep strong at 15½ x.d., and the Globe shares of both classes are also good. There has been a little activity in the Marconi shares, where the parents are dull at 3 1/16, while Americans, after going back to 23s., braced up to 23s. 6d. Marconi Marines remain about the firmest of the group at 2 9/16 middle. There is nothing fresh to report in the telephone group, save ½ decline in Orientals, lowering the price to 3.

Electric lighting issues are a little irregular, a rise in Metropolitan preference being off-set by falls in Westminster and Charing Cross preference. There seems to be some doubt felt as to maintenance of the 1916 dividends. Edisons rallied to 24s. Electric Constructions eased off to 1½. General Electric ordinary are 5s. down.

Rubber shares are weak on heavy selling of shares in a few of the leading companies. After dipping to 2s. 2½d. per lb., the raw product recovered to 2s. 4½d., but this failed to have any stimulating effect upon prices of shares, and there is a general heaviness throughout the list, holders of rubber shares asking, with some asperity, why the price of their commodity should be about the only thing which has fallen during the war, while everything else has risen so materially. The iron and steel list is also a trifle lower, from which it would appear that the provinces are finding other channels for the use of their money, and amongst the mining markets, tin shares are a trifle easier, notwithstanding a rise in the price of the metal to about £306 per ton.

Industrial Reconstruction Council.—The first meeting of this Council was held on Tuesday, December 11th, at the Holborn Restaurant. The chair was occupied by the President, Sir Wilfrid Stokes, K.B.E., and the draft Constitution submitted by the Provisional Committee was approved and adopted. Mr. Ben Tillett, M.P., emphasised the need for a propagandist body which would help to remove the distrust of Labour and the contempt of Capital. The need of the future was not only efficiency of Labour but efficiency of Capital. He was glad to associate himself with a body which had for its object the education of all parties in the real position of industry. Mr. Ernest Benn, in presenting to the meeting the report of the Provisional Committee, laid stress on the single purpose of the new Council. It was a propagandist body, and its battle-cry was "Self-Government for Industry." Mr. Benn gave a brief sketch of the present chaotic condition of industry. Much of the trouble had inevitably arisen from the state of War, but much also was the result of ever-increasing interference by a central bureaucratic Government. The only way by which this nation could work out her industrial salvation was to establish within each trade a self-governing body representative of all those engaged in that trade, charged with the duty of maintaining and developing it in the national interest. The membership of the Industrial Reconstruction Council was open to all sections of the community of whatever shade of opinion, the only qualification being a genuine desire to promote the doctrine of industrial self-Government. The Council would start immediately upon a great campaign throughout the country and in every trade; on the one hand seeking public interest in the vital problems of industry, and on the other encouraging the representatives of the trade themselves to meet together to take concerted action for the full development of their industries. Mr. Emil Davies, speaking of the Whitley Report, emphasised the fact that the Government had now for the first time distinctly laid it down that Labour was no longer a chattel. This idea was fundamental. There was a great need for some body like the Industrial Reconstruction Council which would popularise the principles embodied in the Report. Miss Mona Wilson, as a member of the Whitley Committee, supported the establishment of the Council as a propagandist body. It was extremely important that Capital and Labour should understand what a very wide field was open to the Whitley Councils if set up in all industries, and how necessary they were as representative bodies with whom the Government could negotiate in all matters affecting Labour, commerce and industry.

ELECTRICAL COOKING AS APPLIED TO LARGE KITCHENS.

By W. A. GILLOTT, A.M.I.E.E.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS.)

Owing to the favourable tariffs now in force in most districts, electrical cooking in large kitchens is now a sound commercial proposition. In new premises, where it is pro-

so fitted that it is practically impossible for steam to penetrate through to the insulation. On well designed apparatus solid type connections are employed, and where a connection is required from, say, a hot-plate to the terminal chamber, the wiring may be run in solid drawn tubes direct from the hot-plate case to the terminal box, this being fitted well up and away from any position likely to be affected by liquids boiling over. By this method, flexible metallic tubing is dispensed with, thereby removing a weak link.

All elements except the grills should be connected in series-parallel, and where possible they should be so arranged that after the cooking has thoroughly commenced, they can be switched to "low," and provide sufficient heat to complete the operation. Under these conditions, the elements are running at quarter load most of the time, with the result that they have a much longer life than if parallel elements were employed throughout.

On apparatus where the heating elements are clamped under pressure, such as hot-plates, water boilers, stock pots, steamers, &c., the pressure plates should be made of strengthened cast iron in preference to wrought iron, in order to prevent them from buckling, and causing uneven bearing surface on the element. The element should cover as much surface as possible, as concentration of heat on apparatus of this class is likely to cause premature failures. On apparatus where the loading is comparatively high, it is advisable to employ cast iron or steel bottoms in place of copper. Instances have occurred in the author's experience where the adoption of cast-iron and steel bottoms on large boiling units has overcome the trouble of premature failures.

Quick Service and Efficiency.—In laying out a cooking scheme for a large kitchen, it is essential to arrange the apparatus so that the chef can supervise the cooking with a minimum of effort. By a judicious classification of apparatus, such as grouping all roasting

and oven work in one section, vegetable and pudding steaming, &c., in another, and toasting, egg-poaching, and tea-making in another, it is possible considerably to increase the efficiency of the kitchen, inasmuch as quicker service is given, and a possibly smaller kitchen staff required. In restaurant work, where special attention must be given to ensure quick service, it is often necessary to provide special apparatus to deal with some classes of food which are required at a moment's notice.

Where large quantities of water are required for tea-making, the author recommends that the water be raised to a tem-

perature to run the kitchens on up-to-date and efficient lines, electricity is usually employed. The words "large kitchens" apply more particularly to the class of kitchen met with in restaurants and in works or other large business premises, when staff-feeding is required for a large number of employés. In Newcastle-upon-Tyne there are several such institutions depending entirely upon electricity for cooking. The author considers the future of this branch of electrical industry to depend, first, upon close co-operation between the supply company's engineer and the manufacturer, and, secondly, upon the interchange of ideas and experiences between different supply companies and municipal engineers who have the plant actually running on their own mains. The figures given in the paper have been obtained under ordinary working conditions, and in some cases without the knowledge of the cook using the apparatus. They can therefore be taken as a basis for similar installations working under somewhat similar conditions.

In drawing up a scheme for cooking in large kitchens, the essential items are: (1) Reliability, (2) quick service, (3) efficiency.

Reliability.—Under this item the question of electrical distribution from the service cables is as important as the electrical work on the apparatus itself. At a restaurant where there are serveries on different floors, quite apart from the kitchen, especially where the total loading of the apparatus in the serveries is appreciable, two pairs of cables should be brought from the service, which on large installations should be the main distributing centre, to each servery and kitchen. In each kitchen or servery these cables should terminate in a double-pole switch of ample size and single-pole fuses of the replaceable pattern, and connections be provided to supply through branch single-pole fuses to the various pieces of apparatus, each of which should be controlled by a double-pole switch adjacent to the same.

The apparatus itself must be of solid construction, and designed to stand hard and continuous wear, and be efficiently earthed. All switches and fuses must be fixed on a separate board within easy reach of the chef, and each section of the apparatus should be fitted with a switch, fuse, and indicator. The internal wiring of the apparatus must be

perature of approximately 160 deg. F. by means of a coke boiler or live steam, the final boiling being carried out in self-contained electric urns. The author usually fixes urns in banks of two, each supplied with hot water through a hand-fed valve, and arranged so that as one is being emptied, the other is boiling up ready for use. By this method, one is always in a position to meet a "rush on teas." In some cafés, toast is often in great demand. By using suitable

FIG. 1. MAIN KITCHEN, INSTALLATION "A."

FIG. 2.—MAIN KITCHEN, INSTALLATION "A"

racks, several pieces of bread can be toasted at one time. At the installation under Item "A," 2,000 pieces of toast can be supplied in one hour.

Plate and dish warming is a very necessary item, especially in restaurants. This becomes very important on installations such as "A" below, where dining rooms are on several floors. Hot cupboard for this class of work should be lagged, as they are called upon to work several hours a day, and, by conserving the heat, running costs are kept down. The

hot-plates are used, the loading should not exceed 20 watts per sq. in. for an 8-in. plate.

(To be concluded.)

DISCUSSION IN LONDON.

The author, in concluding the reading of his paper, said he had obtained information with regard to over 400 cooking installations of this type in this country, with a total connected load of 22,000 kW., and these were supplying 130,000 meals per day; 80 per cent. of this equipment had been put in during the last three years. In the Newcastle area they had proposals at the moment for approximately 4,000 kW. of cooking plant to supply 22,000 meals per day. He went on to urge the necessity of effective co-operation between the supply authorities and the manufacturers, who had done most of the work up to the present, suggesting the necessity for a representative committee to develop this special branch of business.

Mr. A. F. BERRY, in opening the discussion, said the cost figures given might be expected in an area where exceedingly cheap power was obtainable. Many features in the installations reminded him of coal and gas practice. With big ovens it was usual to cook all kinds of meat at the same time, and this explained the similarity of "restaurant taste" in meats. The author showed that five persons were served per kW. installed, but he had found it possible to deal with 10 persons per kW. if he had independent hot-water heating. He also found as a result of continuous observation in restaurant practice that such cooking could be done on .25 unit per person; he did not want them to think that .5 unit per person, as mentioned by the author, was necessary. There was no real necessity for big ovens; big joints cooked less efficiently than smaller ones in smaller ovens. In his own works canteen exactly 4 oz. of meat (including bone) per head was used; the Food Controller allowed 5 oz., and Government specifications for apparatus allowed for 8 oz. per head, though the actual result in practice was not usually ascertained.

Mr. SOWERBY, speaking as a user of one of the installations

FIG. 3.—KITCHEN, INSTALLATION "C."

question of keeping food hot is also a very important item, and in restaurants this has to be carried out in an entirely different manner from that adopted in staff-feeding establishments, where the meals are usually provided at a specified time each day.

When specifying the essential items in large-kitchen practice, efficiency was placed third. The author is convinced that the "man who pays the bill" would prefer to pay a

FIG. 4.—KITCHEN, INSTALLATION "D."

little more for cooking, knowing that he is getting this returned in reliability. It is not a serious thing, for instance, if a restaurant or hotel kitchen were built up from scratch with a meal coming to a breakfast covered by endeavouring to extract the highest possible efficiency from a piece of apparatus at the expense of reliability.

Upon referring to the schedules of installations, it will be noticed that the number of hot-plates has been kept low, and several pieces of self-contained apparatus have been provided. This is more practical than cooking in utensils on hot plates. This increases the initial cost, but it is money well spent, and the policy should be adopted wherever possible. Where

described in the paper, said he had had experience of gas cooking, and knew the cost. Their experience with an electric cooking installation originally intended to serve 1,200 people, and now catering for double the number, was most satisfactory, and the figures of the estimate had been improved upon. The saving in meat on the Food Controller's figure was not necessarily a saving due to the installation, as in their case they had not reached the Controller's figures in the past. The sanitary condition of their kitchen had been specially commended, and was due entirely to the ease of operation. Their grill trade had gone up to four times its amount before the use of the electric grill. He warned them

not to under-estimate their requirements for electric cooking, as the trade always increased, and this must be allowed for. Despite the efforts of the Job's comforters, even of the electrical persuasion, they were quite satisfied with the result.

Mr. H. J. CLARKE said he had the oversight of a plant catering for 5,000 meals a day, by means of two installations. He had never regretted having adopted electric cooking, and the energy consumption per meal—no electricity being used for water heating—was very low, being in November .15 unit per meal. The installation was a novel one, on the American Cafeteria principle, using electrically-heated shelves from which the customer served himself. With the second installation they supplied 400 meals per day during the first week, but this had increased up to 2,500 meals per day for some weeks past.

Mr. C. J. NOBBS said running and maintenance cost should receive prior consideration; initial cost was effected by the conditions of installation at the moment. Looking at the author's A and B installations, the former used .29 unit and the latter .5 unit per person, but A was a restaurant and B was a canteen. If an accurate analysis of the total weight of food were made (including all water) it would form a unit basis; B took three times the energy for water heating. If they took 1,500 lb. food for A and 680 lb. food for B, and allowed for water-heating units, they found .94 lb. per unit cooked by A, and 1.38 lb. for B; the difference was explained by the conditions in the two cases. Certain steamers in the A installation were operated by steam, whereas B was entirely electric, and allowance must be made for the steam heating in the comparison. It was necessary to know maintenance costs for gas and steam apparatus with accuracy. He found that the maintenance on electric installation A worked out at $\frac{1}{2}$ per cent. of the capital cost, and on installation B at $\frac{1}{4}$ per cent., but if similar types of apparatus had been used in each case, and the net cost of installation taken, he estimated that the comparative figures would be A $\frac{1}{4}$ per cent., and B $\frac{1}{4}$ per cent. At a hotel with 400 beds electric heating maintenance cost about £100 per annum, which tended to show an additional advantage for the electrical method. In the case of his firm, apart from domestic work, about 12,000 kw. of heavy electric cooking plant had been sent out in three years.

Mr. BRAZIL said the author was right in putting reliability first; he felt that the contact difficulty was all against the hot-plate. He described certain experiments relating to element construction, as a result of which he found that a fire-clay element could be made with 140 watts loading per inch of length, as against only 64 watts with a mica element; the former element had stood up well, but it took 4 mins. to get to a proper heat. The manufacturer must consider the question of making apparatus suitable for 400 volts, and so overcoming balancing troubles.

Mr. GRESLEY was interested in the possibility of using electric cooking on railway dining-cars, where it was difficult to avoid using gas, despite the representations of the Board of Trade. The kitchen on a diner measured 14 ft. by 6 ft., and often dealt with 100 five-course meals at one sitting. Such a car weighed 40 tons, and he asked what extra weight would be required, and what arrangements would be required to keep the apparatus working when the train was standing.

Mr. F. H. WILLIAMS agreed that the future of the business depended largely on the co-operation of the manufacturer and central station. All the essential items mentioned by the author were equally important, but efficiency often took second place on account of first cost. The running and maintenance costs were always more important than the initial cost. He quoted various figures to show that specially-built apparatus was more efficient. As regarded running cost, a staff kitchen supplying 80 breakfasts, 480 dinners, 480 teas, and 12 suppers for five days a week, with breakfasts and suppers on the sixth day, and where 80 gallons of water were boiled each day, took 955 units per week, costing 11d. per unit; this installation had done two years' work. In another case, a convalescent hospital, where all meals were supplied and 36 gallons of water boiled, 130 units were required per day; this installation had been in use three years.

Mr. P. FLETCHER said a great deal could be said on the technical side, but the chief thing was reliability. He saw no reason why elements should not be made of uniform dimensions, so that any dealer could stock replacements. Theoretically, the large installation was the more efficient, but its efficiency was affected by having to meet small demands as well as large. Looking ahead, it seemed that it would be impossible to continue low-pressure distribution, and they would have to adopt high pressures with transformers in order to save the cost of mains, if much cooking apparatus were connected. He asked what was the desirable point to depart from electric water heating. He also urged that it was up to our manufacturers to produce a satisfactory switch for this work.

Mr. W. R. COOPER would have liked to see the paper more critical; the character of the service required more minute description. There appeared to be a smaller diversity with the works kitchen than in domestic cooking. The oven and grill faults appeared to be excessive, and he thought that wiring faults could have been reduced in number. He asked what was the author's experience with radiant apparatus, and whether he had employed thermostatic control.

Mr. GODDARD (of Messrs. J. Lyons & Co.) expressed his

interest in the results shown in the paper. His firm were not using electricity for cooking, and had no figures as to the cost of gas, &c.

Mr. WILSON felt that the load curves shown were not such as to encourage the supply authority to give a low tariff. He thought possibly the "hay box" principle, recently described in the ELECTRICAL REVIEW, could be so adapted as to modify such a peaked load, and that probably a saving in food would result by slow cooking. Engineers and manufacturers must co-operate to push forward electric cooking, and great assistance would be obtained by the installation by the industry of electrical equipment in the numerous cooking schools throughout the country.

Mr. WALKER, speaking as a hotel manager, thought that the kitchen temperature in a dining-car must be raised by gas apparatus, and that electric cooking had a considerable future. The time taken to obtain cooking temperatures was very important, especially for grilling, in hotel and restaurant work. He discounted staff reduction with electrical methods, and asked whether records of kitchen temperature were available where electricity was used. Any chef would, he thought, favour a solid-top heating table, where the locally heated areas enabled the cook to select any degree of temperature for his pans, &c.; this gave much better heat control than by switches. A good cook would get good results whether using gas or electricity, but the gas did affect the utensils.

Mr. HOLMES said, as a considerable user of electric cooking, he found it very satisfactory, and had no wish to change to other methods.

Mr. C. W. CROSBIE drew attention to the practical importance of the similarity of load factors in the installations cited, viz., 13, 17.8, 13.4, and 13.1 respectively, or an average of 14 $\frac{1}{2}$ per cent. The figures for installation B, however, were worked out on 130 kw., whereas a total of 165 kw. was installed, and, taking the latter figure, the load factor came down from 17.8 to 13, or almost identical with the other installations. They might expect a maximum demand from such installations of 45 $\frac{1}{2}$ per cent. of the connected load, the actual figures being 35, 48, 44.5, and 55 per cent., and giving some indication of the probable cost of maintenance. Maintenance cost in terms of 1,000 units consumed had a tendency to mislead; expressed in per cent. of capital outlay, the figures became .75, 2.35, 3.65, and 4.17 per cent., and he did not regard them as satisfactory. Installation B in particular showed a bad record, especially as regarded ovens, hot cupboards, urns, and steamers; it would be interesting to know, if external wiring faults were referred to, if the same contractor was responsible for all the work. The relation of the meal hours to peaks was not shown. He agreed with the principle of pre-heating water, but not with the method of doing it. In the 350-kw. installation, the conditions were such that open lights and fires could not be permitted, and it was essentially a case for electric thermal storage, with a view to reducing the peak and filling up the load gap between 6 p.m. and 8 a.m. The water-heating load of the boilers and urns in this plant would, he thought, add 55 to 60 kw., which was a considerable proportion of the average 190-kw. peak which might be assumed from the average of "peak load/connected load" shown by the load curves. Much of this water-heating load could have been transferred to the slack time had a thermal storage system been installed in connection with the urns, which latter would then only be used when the load from other apparatus was considerably reduced. The exact effect on the load factor would depend on the amount and incidence of the load on the rest of the plant, but its importance in this case might be judged from the fact that for every 1 per cent. increase in load factor above 10 per cent., a reduction of 2 per cent. was made in the charge. As an instance of the improvement of load factor due to thermal storage, Mr. Crosbie mentioned the case of his domestic installation, where the load factor of the lighting was about 5 per cent., the cooking and heating load factor 6.8 per cent., and adding the 100 per cent. thermal storage load factor, gave a combined load factor of 11 or 12 per cent.

Mr. E. T. WILLIAMS asked why, when steam heating was used, the water was not brought to boiling temperature for direct use, instead of being pre-heated. The author did not state whether the meals were spread out or eaten at one time. He thought wiring faults were numerous, and asked what they included. The capital cost of installing the equipment was misleading, because it included connecting to the source of supply, and was not applicable in cases where a works generated its own supply. Future development depended on hiring facilities, which must be provided. Where the price of energy depended on load factor, the effect on this of the cooking load must be closely watched, as under certain conditions the price for the whole supply might be increased. He understood that in the North it had been found in some cases that the cooking demand was high on a Monday, and dwindled away to nothing on Friday.

The AUTHOR, in replying, said the consumer should not imagine that the cost of energy was a determining factor; there were so many other advantages. He considered that electricity at .75d. per unit would easily compete with gas at 2s. per 1,000 cu. ft. for cooking. The Ministry of Food was conducting tests in various localities on gas, coal, steam, and electric cooking, but he (the speaker) did not agree with

its methods of cooking. It was not possible to get munition workers to economise in food, and this affected the results shown. In installation "B" all the steaming was done by electrical steamers, but in "A" continental steamers were used. Electric cooking in a dining-car might entail the use of an independent generating set, or of a battery which could be boosted at stopping places; the ordinary belt-driven dynamo would not suffice for heavy discharge work. A short time previously he had investigated the question of electrifying a whole village, where the maximum demand would be 5,000 kW., and he found that L.T. supply would not meet the case; he thought it would be best to distribute 200-volt single-phase current, and so dispense with balancing difficulties.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

AUSTRALIA.—A new and consolidated list has recently been issued by the Department of Trade and Customs specifying the articles for the exportation of which from the Commonwealth a Customs "Permit" must first be obtained. The list is a very comprehensive one, and includes the following:—Electric appliances adapted for use in war, and their component parts; metals, alloys, minerals and ores of all kinds; searchlights and parts; rubber of all kinds and in any form, including goods made wholly or partly of rubber; materials for telegraphs, telephones, and wireless; celluloid; copper, part wrought; cork, corkboard, and cork dust.

The Department of Trade and Customs has also issued the approved form of declaration which is required to be printed or stamped on invoices for goods exported to Australia, and duly signed and completed by a principal officer of the manufacturer or supplier. In view of its importance, the text of the form is given below:—

I,.....(manager, chief clerk, or as the case may be).....of.....(name of firm or company).....of.....(name of city and county).....the manufacturer or supplier of the goods enumerated on this invoice, amounting to....., have the means of knowing and do hereby declare—

1. That the said invoice is in all respects correct and true.
2. That the said invoice contains a true and full statement showing the price actually paid or to be paid for the said goods, the actual quantity thereof, and all charges thereon;
3. That the said invoice also exhibits in a separate column the actual price at the date of this declaration of equal quantities of identically similar goods to any purchaser for home consumption in this country;
4. That no different invoice of the goods mentioned in the said invoice has been or will be furnished to anyone; and
5. That no arrangement or understanding affecting the purchase price of the said goods has been or will be made or entered into between the said exporter and purchaser, or by anyone on behalf of either of them, either by way of discount, rebate, salary, compensation, or in any manner whatsoever other than as shown in the said invoice.

Signature.....

Witness.....
Dated at this day of 19.....

NOTE.—The witness need not necessarily be a magistrate, notary, or other public official, but may be any person competent to sign as a witness to signatures on ordinary business documents.

All declarations tendered to the Department must be made by the declarant in a personal capacity—that is, the declaration must run "I, John Jones," &c., &c., and be subscribed "John Jones" (or John Jones's ordinary signature), and not, e.g., "Brown & Thomas, per John Jones." The ordinary signatures of declarants are sufficient at the foot of declarations, the full name of the declarant being stated at the head of the form.

CHILE.—In virtue of a Decree issued subsequently, the provisions of the Decree of January 26th last, which instituted a new form of Consular invoice for goods shipped to Chile—see *ELECTRICAL REVIEW* of August 24th—are not to come into force until further notice, so that Article 283 of the Chilean Consular Regulations, specifying the particulars to be given in Consular invoices for goods shipped to the Republic, is to remain in force.

SOUTH AFRICA. By the provisions of Act No. 36 of 1917, the increases of Customs duties which were imposed in 1915, and resumed last year, are again re-imposed, with a few exceptions, and will continue in force until June 30th, 1918. Particulars were given in the *ELECTRICAL REVIEW* of September 15th, 1916, as to the electrical goods affected.]

SOUTHERN RHODESIA. A Customs decision has recently been issued which brings Southern Rhodesia into line with the Union of South Africa in regard to the duty on insulating tape (sheving) see the *ELECTRICAL REVIEW* of October 12th last. Under the General Tariff the duty is 3 per cent. ad val. British goods entering free.

THE "ELECTRICAL REVIEW'S"
ELECTRICAL & ALLIED TRADES DIRECTORY
(THE RED BOOK),

1917 EDITION.

H. ALABASTER, GATEHOUSE & KEMPE,
4, Ludgate Hill, London, E.C. 4.

With the decision of the Court of Appeal, on Tuesday last week, dismissing the appeal of the Attorney-General "at the relation of the Gas Light and Coke Company," against the judgment of Mr. Justice Astbury, a further stage has been reached in the controversy between the gas interests and the electricity supply industry. Whether the dispute will be carried to the final Court does not appear; as notice of appeal was not given, however, we feel at liberty to comment on the case. To our mind, from the very first the result was a foregone conclusion, and, while we were debarred from expressing our views upon the merits of the case, in our issue of April 20th last we urged the municipal electricity supply authorities to rally to the support of the Hackney Borough Council, which was singled out for attack by the Gas Co., and whose success was of vital importance to all of them that had a power load, believing, as we indicated, that there could be little doubt as to the outcome.

As in previous cases, the matter turned upon the question of preferential treatment of a certain class of consumers by the supply authority. To us, who are not lawyers, it is difficult to understand how any such action could be expected to succeed, seeing that the Act distinctly states that undue preference must not be shown to any consumer in comparison with any other consumer under similar circumstances. Now, consumers of electrical energy for lighting are not consumers "under similar circumstances" to those who take energy for power only; the gas companies admit that this is true, and in some cases they themselves make different rates for lighting and for power. Again, consumers of energy both for lighting and for power form a third class, and each of these classes is capable of indefinite sub-division, from the point of view of their effect upon the working and finances of the supply undertaking. So long as the same terms are offered to every consumer in a given class, we fail to see how the terms of the Act are infringed, and there never has been any suggestion that such was not the case at Hackney or elsewhere under the type of tariff in question.

What the Gas Co. really claimed was that one class of consumers was preferred over another—that the user of light only was charged at a higher rate than the user of both power and light, so far as the lighting portion of his consumption was concerned; but the Act says nothing about preferential treatment of a whole class of consumers, and a class may comprise any number of consumers from one upwards without undue preference, if the same tariff is offered to all who choose to place themselves in

that class. Thus, a special rate might be offered to all electrochemical works which came on the mains; there might be only one such works in the district—but at any time others might be established, and would be entitled to the same terms, under similar circumstances.

The law, however, appears to require that preference shall not be shown to a class of consumers, but that where more favourable terms are granted to one class than another, it must be capable of demonstration that the former are the more advantageous consumers to the supply undertaking. The Gas Co. contended that an intermediate scale should be provided for customers who used both light and power, higher than that offered to power users only, but lower than that offered to users of light only, thus recognising the division into classes, but alleging undue preference as between class and class. But the weakness of their case was effectively demonstrated by Lord Justice Swinfen Eady in his admirably lucid judgment, of which we give a summary elsewhere in this issue. He pointed out that by the working of the maximum-demand system upon which the tariff was based, precisely that result was attained which the Gas Co. desired—namely, that the user of energy for both purposes was charged at a higher rate than he would have had to pay for power only, because the lighting load necessarily worsened his load factor. "The effect," he said, "of the sliding scale is that it does in fact introduce and adjust a third scale for power and light combined, the charge being higher than would have been the charge for power only, and lower than would have been the charge for light only." Hence there was no breach of the Act. Lords Justices Warrington and Scrutton held the same views, and the appeal was dismissed with costs.

Incidentally, we may point out that, following the line of argument of the appellants, a flat rate is one of the worst offenders from the point of view of equity. A one-hour lighting consumer under this tariff is charged at the same rate per unit as a three-hour lighting consumer; but the latter is by far the more profitable to the electricity undertaking. Hence the former, who may even be supplied at a loss, receives undue preference over the latter!

National Works in Germany.

THE threat of nationalising the supply branch of the electrical industry in Germany has been hanging over the undertakings now for some years past, and is gradually assuming a material form in directions which were scarcely expected. In the first place, an act which may be regarded as a war measure is the recent acquisition by the Imperial Government of the undertaking of the Electro-Works Co., which furnishes energy to Government works for the fixation of nitrogen, from a lignite fuel generating station in the district of Bitterfeld, the cost of acquisition being put at approximately £2,500,000, as mentioned a short time ago. Secondly, a big scheme is under way in Bavaria for the further utilisation of water powers in connection with the establishment of local industries, and the conversion of Bavarian railways to electric traction. In the third place, the Prussian Government has laid before the Diet an estimate for £650,000 for the erection of a steam-power station near Hanover. This scheme lies in connection with the power station built on the Weser near Bevergen in 1906, and the project settled in 1916 for the utilisation of the upper reaches of the Weser and of the water power of the Main. The object of the Hanover station is to connect these two power stations, and thus form a large and self-contained State area of supply from Bremen to the Main, but

the new station is only to be brought into service two years and a half after the conclusion of peace. In Saxony, too, where the Government already owns certain electricity supply works, estimates have just been placed before the Diet for an expenditure of £2,000,000 on extensions and the acquisition of further shares in two companies. It would thus appear that the developments being undertaken by Federal States independently will render it exceedingly difficult for the control of the supply business to be proceeded with, as was originally suggested, on an Imperial basis. At the same time, no one can foresee what results may possibly ensue from the Imperial absorption of the large works in the district of Bitterfeld, and the long-distance line which is now being carried thence to Berlin to assist in coping with the effects of the coal scarcity in the capital.

Electric Cooking.

ELSEWHERE in this issue we conclude our abstract of the interesting paper on electric cooking read by Mr. W. A. Gillott before the Institution of Electric Engineers. The subject is of particular interest at the moment, as, though domestic electric cooking has necessarily been somewhat in the shade during the war, the latter has apparently brought into greater prominence than might otherwise have been the case the advantages of large-scale or collective electric cooking. One of the features of Mr. Gillott's paper which will interest central-station men is the almost monotonous similarity of the load curves, although both restaurant and staff kitchens are included; the curves, in fact, coincide too well, and this presumably will be a feature of the works cooking load in most industrial centres. The London discussion disclosed the similarity of the load factors of the installations described, which for this class of cooking can apparently be taken at 13 per cent. with a maximum demand of 35 to 55 per cent. of the connected load; attention was also drawn to the obvious necessity, where the charge for energy is based on load factor conditions, of adopting those types of apparatus which favour an off-peak load—this, of course, being possible where electric water heating is employed.

It was noteworthy that the sense of the meeting was almost wholly in favour of placing reliability before heat efficiency; this is a point we have often emphasised, for it is obvious that the consumer must be able to depend on his apparatus, and that, even were the latter highly efficient in the hands of an expert, the average user could not hope to reproduce his results day in and day out. What we may call the "cooking efficiency" of the apparatus must exercise an important influence on its design; a few units more or less are of little consequence, in comparison with ease and certainty of obtaining the desired cooking result. In this connection, the heated surface hob, by reason of the great range of heat intensities which it allows to the cook, would appear to offer considerable advantages over any form of switch-controlled hot-plate, though, of course, this is a matter which practice only can settle.

As there is no question that electrical cooking on a large scale is a desirable enterprise, both to the user and to the central station, it is probable that not so much interest attaches to Mr. Gillott's paper itself as to his concluding remarks on the necessity of forming an energetic and unbiased advisory committee representative of both central-station authorities and manufacturers, in order to promote the business end of what is already a good proposition.

This proposal is, of course, not a new one, and if carried out it would greatly speed-up the commercial development of electric cooking.

COAL STACK FIRE RISKS.

By E. B. PAUSEY.

DURING the present difficult times, and doubtless for a considerable period after the fighting has ceased, there can be no question but that fuel will occasionally, like many other necessary commodities, be abnormally scarce. On the one hand, shortage of skilled efficient labour, and, on the other, heavy and sudden demands, are conditions that are certain to persist at least during the period of reconstruction, and, in spite of increased economies which may be brought about by the general adoption of scientific systems of boiler-house control in place of the more or less crude methods in operation at the present time, the possibility of shortage due to these conditions will compel those in charge of important power stations to safeguard themselves by providing sufficiently large stocks of fuel to tide over any such temporary periods of scarcity as may be reasonably expected. In this country coal is at present practically the universal fuel, and the provision of a coal stack is the most obvious and most popular means of keeping reserve supplies at hand.

Now, easy though it may be to dump down coal on a stack, bitter experience tells us that care and thought must be used, otherwise serious loss may take place owing to the overheating or, maybe, ignition of the stored fuel. This is a risk which cannot be completely covered by insurance; if the reserve fuel is lost and the regular supplies fail, no amount of money payment will avail to prevent stoppage of the plant, an occurrence whose cost to the community cannot be estimated. Therefore, in asserting, as I do, that the matter is of national importance, I believe that I am not exaggerating its claims, and I hope that a little discussion of the possible causes of the spontaneous ignition of coal and the means whereby the risk thereof can be minimised may not be without interest. I am, of course, quite aware that the subject is not entirely new; there has, indeed, been a large amount of theorising upon it; but I certainly think that a majority of the theories propounded have been built up on hasty generalisations from insufficient evidence.

For instance, there is the question whether sulphur is responsible for the spontaneous ignition of coal. Many people whose opinions are well worthy of consideration will answer this question decidedly in the affirmative, while others, equally worthy of consideration, will give just as emphatic a negative. Both parties claim to speak in the light of experience, yet, so far as I am aware, not one has given us any definite reason, or anything but bare assertion or denial, for his belief or unbelief. Now, on the one hand, the oxidation of sulphur is not, at ordinary temperatures, such a very vigorous action, nor does it evolve nearly so much heat as that of carbon or hydrogen, and at the same time sulphur only forms a small proportion—say about 1 per cent.—of coal, so that apparently it can have but little heating effect in any case. On the other hand, an efflorescence of what appears to be sulphur is a frequent sign of fire in a coal stack or large ash heap; at the same time, this is not evidence that the sulphur is responsible for the outbreak. It is quite possibly due to the dissociation by heat of sulphur compounds, with the result that on arrival at the cool exterior of the stack the sulphur vapour becomes condensed and appears as flowers of sulphur, being thus not a cause but an effect of the internal heat of the stack.

It is, however, quite possible that sulphur, either in the free state or in combination with other elements, may so enormously accelerate the oxidation of the carbon or hydrogen in the coal by catalytic action as to be an indirect cause of the overheating. In any case, I think there can be little doubt that the overheating is at least started by catalytic action of some kind.

While catalysis is a well-known and familiar phenomenon, it may be as well, in order to emphasise its importance and the great probability that it is largely responsible for coal stack fires, to illustrate it by a description of the catalytic effect of platinum on a mixture of hydrogen and oxygen. It is a matter of common knowledge that if a mixture of

these two gases be kept at an ordinary temperature no apparent combination will take place between them, no matter how long they are kept; but that if a lighted taper be introduced the two gases immediately combine explosively, forming water and liberating considerable heat. Why, it may be asked, should the introduction of the light have such an effect? The unthinking "man-who-knows-it-all" will say: "Why, because you have set light to it, of course!" and put you down as a fool for asking such a question. But it pays sometimes to ask obvious questions, and to give consideration to what are generally accepted unquestioningly as every-day facts.

In the present instance, what happens is that the portion of gaseous mixture immediately adjacent to the flame becomes heated so much that combination takes place, developing so much heat that the next portion of gas is sufficiently heated to combine, the effect being that a flame suddenly flashes through the mixture, and the combination of the whole is completed almost instantaneously. If the experiment be repeated with finely divided platinum in place of the lighted taper, practically the same result occurs, the cold platinum having the same effect as the hot flame of the taper. Moreover, if the mixture of gases be pure the platinum can be used over and over again indefinitely, showing that it does not enter into combination itself, but that its presence is sufficient to accelerate enormously the chemical action. This is the phenomenon known as catalysis.

To get an idea of what this catalytic action means, it should be borne in mind that the chemical combination of hydrogen and oxygen although it does take place at ordinary temperatures, is then vanishingly slow, the relation between the time taken for the action to proceed to completion, and the temperature of the mixed gases being such that for every 18° F. increase of temperature the speed of the action is approximately doubled. If, therefore, a mixture of the two gases in a certain vessel would completely combine in the thousandth part of a second when at a temperature of $2,000^{\circ}$ F., a fairly simple calculation will soon show that a period of many millions of billions of years would have to elapse before the action could proceed to completion if the temperature were maintained constant at 60° . Yet this awful abyss of time, long enough, conceivably, to cover the whole life of the Solar system from the almost infinitely distant period when the primordial nebula began to condense right along to that other far-off time when the sun, its last spark of fire vanished, shall be no more than a huge mass of clinker, may be shortened to a fraction of a second merely by the application of a little platinum, which need not even be hot!

Catalysis may be, therefore, a prodigiously powerful factor in increasing the speed of an action. When we consider that though a piece of coal may be kept indefinitely at ordinary temperatures without any apparent change taking place, yet when stored in a stack of large size heating occurs, we are almost forced to believe that the first heating must be due to catalytic action by some substances present in the coal upon the hydrogen or volatile hydrocarbons given off by it—in extremely small proportions at first, but more and more rapidly as the stack heats up.

Another property of catalysts may be noted; it was remarked in connection with the combination of hydrogen and oxygen that if the gases were pure the platinum could be used over and over again indefinitely. If there are certain impurities present, the catalyst will gradually lose its power, becoming, in fact, "poisoned." This is the reason why automatic gas-lighters on the catalytic principle are not a success—they are too short-lived.

A fine field for investigation is thus opened; let some chemist ascertain what are the catalysts which cause spontaneous ignition of coal, and also their appropriate "poisons," then all we shall have to do will be to spray our coal with the latter, and we shall be able to stack it to any depth we please without any fear of danger!

Such an achievement is, however, decidedly a thing of the future, and, in any case, its accomplishment is very problematical; so that at present, when stacking any coal containing more than a small proportion of inflammable volatile matter—a bituminous coal, such as is often used—

all that we can do is to assume that it is dangerous, and act accordingly.

Probably the chief factors regulating the liability of a given coal to fire when stacked are: the amount of free hydrogen, or methane, or other hydrocarbons given off by it at ordinary temperatures; smallness of size and consequent increased surface from which such volatile bodies may be disengaged; the possibility of a sufficient supply—and no more than a sufficient supply—of oxygen to its interior; and insufficient means of dissipating any heat generated. A bituminous slack, especially a “nutty” slack made up of particles of all sizes up to, say, $1\frac{1}{2}$ in. or 2 in. cube—such a coal as is commonly used for burning on mechanical stokers and, consequently, for storage in stacks—fulfils the first three of these conditions to a greater degree than any other class of coal, and a fuel of this kind is, therefore, badly adapted for stacking. While, as already pointed out, the small coal offers a large surface on which chemical action and liberation of inflammable gas may take place, the larger pieces tend to run together and form pockets and channels whereby air can slowly percolate through the stack in quantities sufficient to keep the temperature low, but quite enough to ensure a constant supply of oxygen and maintain the chemical action. The fourth condition will be fulfilled if a coal of this description be stored in a large, deep stack, especially if very much fine coal be placed on the top so as to blanket it and keep the heat in: a good rule to follow is to limit the stack to such a size that no part of its interior is more than 10 ft., or preferably 8 ft., distant from its free surface. If the coal can be deposited in small heaps of from 30 to 60 tons, and so kept for a few weeks before its final removal to the stack, its safety will be much enhanced, since much of the more volatile and dangerous constituents will then be got rid of. While it may be objected that this means a loss of heating value, it must be remembered that this loss is bound to be incurred in any event, and that if it take place in the stack it involves the risk of the much greater loss of the whole, or a large part of the fuel. Stacks should be of a moderate size, and means should be provided for accurately taking their temperature in one or more places; not only should such means be provided, but they should be used regularly, and records should be kept.

Various methods have been suggested for taking the temperature of a coal stack: most of them are incorrect and misleading, the error always being the dangerous one of making the temperature appear lower than it actually is. One proposal is to drive a pipe down into the coal where the temperature is required to be taken, and lower a thermometer down it by means of a string; the method of taking the reading is to haul the thermometer madly up the pipe, and, if one has the luck to bring it up unbroken, to snatch a reading of the rapidly falling mercury, add as much as you think proper to allow for the drop in the reading which occurs when hauling the instrument up, and then pretend that a satisfactory reading has been taken. Another method is to fill the tube with water or other liquid: this is certainly an improvement, inasmuch as the reading of the thermometer does represent the correct temperature of something—although the something is not the coal in the interior of the stack but the water in the pipe; and what use that is, I am unable to see. A much more accurate, but needlessly expensive, system is to use some form of electrical thermometer, placing its resistance or thermocouple element in that part of the stack the temperature of which it is required to ascertain. To overcome the disadvantages of these methods I have proposed the system illustrated in the accompanying sketches, this system being at once cheap, simple, and accurate. Fig. 1 shows an ordinary stem thermometer, graduated to, say, 220° F., enclosed in a glass tube such as a boiler gauge glass; both ends of the tube are fitted with corks, the bottom one being stuck in with varnish to prevent any risk of its dropping out and losing the thermometer. The glass tube is nearly filled with water, and a string attached to the upper end serves to lower it into the thermometer pocket. It is evident that, as the glass tube, water, and thermometer together have a much greater capacity for heat than the thermometer alone, no appreciable drop in the level of

mercury will occur as the instrument is drawn up the pocket, and no doubt need be entertained that the reading taken is a correct one, provided that the instrument is subjected to the correct temperature when in position at the bottom of the pocket. By proper arrangement of the pocket this can be ensured; the pocket, which, as shown in fig. 2 consists of a piece of 2-in. iron pipe of a convenient length fitted with a pointed plug at the bottom and a loosely fitting lid at the top, should contain just sufficient oil to immerse the thermometer tube completely. A very accurate indication of the temperature of the coal adjacent to the bottom of the pocket may then be obtained, from which the condition of the interior of the stack may be deduced.

No more liquid than a sufficient amount to submerge the thermometer tube completely should be placed in the pocket; if an excess be used, convection currents in the liquid may cause a low reading, and, if an insufficient quantity of liquid be used, a similar result may be due to convection currents in the air. The lid has the effect, not only of keeping the pocket free from small coal or other foreign matter and forming an attachment for the thermometer string, but also of preventing any possibility of errors due to the cold outer air obtaining ingress to the pocket.

It cannot be definitely laid down that there is a distinct temperature limit below which a coal stack is safe and

FIG. 1.

FIG. 2.

above which it is in danger, though, of course, if the temperature is approaching 200° F. the stack is undoubtedly in a dangerous condition. The rate of increase of temperature is a much more important factor, and from this, together with any tendency the increase may show to proceed either faster or slower, a sound conclusion regarding the safety of the stack may be drawn. For instance, a stack whose temperature has reached, say, 140° F. but shows little or no tendency to rise further, is in a much safer condition than one whose temperature is at the time of observation low—say 110° F.—but is showing a tendency to rise more and more rapidly. It is, therefore, useful to plot a graph of the temperature on a time base, and to give special attention to any stack which may show a steep temperature graph, particularly if its slope be an increasing one. From this, the necessity for taking temperatures accurately will at once be evident, and the value of such a simple and efficient means of doing this, as has been detailed above, will need no further demonstration.

There seems to be little room for doubt that a wet coal, much as a washed slack, has a distinctly greater tendency to

overheat than a dry one. The lower portion of a wagon of washed slack is often uncomfortably hot to the touch, even though the wagon may not have stood very long. This is probably due to the greater blanketing action of the fine, wet coal, which retards the escape of the heat. For this reason it is a bad policy to put a rough dry slack at the bottom of a stack and cover any considerable portion of it with wet slack. No doubt much less risk would be run if the arrangement were reversed. A rough analogy, which will appeal to those readers, of whom there are, no doubt, many at the present time, who have had gardening experience, is that of a "smother" fire for burning garden rubbish; here slow, but steady, combustion is required, and to secure this, one puts the larger, more combustible matter at the bottom, and covers it progressively with smaller and smaller, less and less inflammable stuff, carefully providing just sufficient means for air to reach the interior. Exactly the opposite principle is the one to follow in laying down a coal stack.

On the question of ventilation very conflicting opinions exist, but most people seem to hold the belief that ventilation is an advantage. For my own part, while I am quite prepared to agree with that belief, provided that the stack is thoroughly and completely ventilated, I contend that this is a very difficult problem, and that inefficient ventilation is much worse than no ventilation at all. For example, if a stack could be sealed up completely air-tight, a little heating might occur at first until the small quantity of oxygen present in the air filling the interstices between the particles of coal had been consumed, but, after that, no further action could take place, and the stack would cool down again. But if an inefficient ventilating system were in use, the air which had been robbed of its oxygen would be replaced by fresh air, and, at the same time, the inflammable gases given off by the coal would, in a large proportion, remain in the stack, so that further heating would be the result. Further, should a fire actually break out, any ventilating system of pipes would act as flues, making it burn more fiercely by creating a draught of air, and spreading it by carrying the heated products of combustion to other parts of the stack. An efficient ventilating system would have to carry away all inflammable and hot gases from every part of the stack, thus ensuring that no dangerous accumulations whatever should take place. This is neither an easy nor a cheap matter, and a better policy is to make the stack as air-tight as possible, and to keep its depth within such reasonable limits as I have already suggested.

It is no easy matter to extinguish a stack which has already fired. Playing water upon it with a hose-pipe is not very satisfactory in its results; it even seems to have the very unwelcome one, of spreading the area of the fire. Excepting as a temporary expedient to enable men to handle the coal, it should not be resorted to. If the hose pipe be used from the top of the stack there is considerable risk of a quite dangerous explosion taking place when the water reaches the fire; considerable quantities of steam, hot water, foul gas, and cinders may be shot up, with possibly serious results. The best policy is, if the stack is a small one, as it ought to be, to remove the whole of it, and, if possible, use it on the boiler fires at once. Parts of it which have not suffered much damage may be used to form the beginning of a new stack; as they will have lost much of their volatile constituents they should, after cooling, be perfectly safe. If the stack is, unfortunately, a large one, the area of the fire should be located and isolated from the remainder by digging a division through the stack as quickly as possible.

The process of removing coal from a burning stack is an unpleasant and dangerous one, and the necessity for it should be avoided as far as possible. I will, therefore, conclude by summarising the means by which coal may be stored in stacks with a minimum of danger. The coal should not be stored in one large stack, but in several stacks each of a moderate size; the depth of each stack should be such that no part of the coal is more than 10 ft. at the most distant from the surface; accurate temperature readings should be taken regularly and recorded. If possible, the coal should be graded; the fine at the bottom, the coarser at the top. Ventilation should not be used; the coal may with advantage be dumped in small heaps to season prior to

stacking. I have little doubt that the more closely these rules are adhered to the less will be risk of loss due to spontaneous ignition.

THE INSURANCE OF ELECTRICAL MACHINERY.

By C. STUART BUYERS, A.M.I.E.E.

(Concluded from page 581.)

Colliery companies are possibly the class of electric power users who favour insurance most. This is only natural, as the conditions of working in coal mines are hard, and breakdowns are frequent, especially in wet mines, where the air is laden with moisture.

The average colliery manager or owner places great value on the insurance company's quarterly reports. Although not an expert in electrical matters, he has sufficient technical knowledge to understand thoroughly the defects reported, and he will usually feel impelled to aid his electrician by giving facilities to have a faulty motor or armature brought to the surface for overhaul.

When a breakdown occurs and the defective part is sent away for repair, he receives one or more reports stating what repairs are being executed, and when the part is likely to be ready for dispatch.

At certain collieries possessing a number of electric coal-cutters, together with a considerable amount of other underground electric plant, it is not unusual to have an armature burnt out, on an average, once a week. Although in these cases the premium charged is high, the fact that the repairs are carried out under supervision, relieves the colliery officials from a considerable amount of correspondence, and any doubts whether they are being overcharged for repairs, do not arise, as the accounts are rendered direct to the insurance company.

The majority of collieries are entirely dependent on electrical machinery to maintain their output, and owners realise that efficient inspection is a valuable feature to ensure continuity of output. It is for this reason that the percentage of colliery companies who have tried insurance and given it up is extremely small.

The adoption of turbo-alternators by many of the smaller municipalities and electric supply companies has caused these concerns to consider the question of insurance.

Turbine plant is by no means beyond the possibility of breakdown, as anyone with experience of this type knows to his cost, and it is the "glorious uncertainty" and the extensive amount of damage which may occur in a few seconds of time which dictate insurance to all users except, perhaps, a few large undertakings having a special reserve fund to meet contingencies.

A fairly large turbine set will cost some £20,000 complete, and it may be insured for the full amount if desired, or against damage amounting to, say, £10,000 or £7,500.

The question of damage to surrounding property should be carefully considered when insuring turbo-alternators, as the ordinary policy only covers damage to the machine itself by breakdown. It is, therefore, in many cases, advisable to have the policy endorsed so as to include damage to surrounding property. The risk of external damage is not great, and consequently the additional premium is small percentage.

A case occurred a short time ago illustrating the uncertainty of turbo-alternator risks. An H.T. machine, about 1,000 kw. capacity was insured when it was installed and it worked in an exemplary manner for several years. So satisfactory was its behaviour, that the firm who owned it decided to give up insuring it; but only a few months after cancelling their policy a serious breakdown took place, necessitating considerable expenditure for repairs. Needless to add, the machine was insured again when it was repaired and resumed work once more.

As the use of electric power is growing rapidly among small power consumers, for whose requirements one or two motors are sufficient, and who thus do not require to employ an engineer or electrician, electrical insurance and inspection

appears to have a considerable future before it, and additional electrical surveyors will be required each succeeding year.

The qualifications required of a surveyor are twofold, and, to use an American mode of expression, they may be stated as follows:—

Tact and common sense	50 per cent.
Engineering knowledge	50 per cent.

It goes without saying, that an electrical surveyor must have a good theoretical training, so that he can diagnose irregularities in the working of the machinery he inspects, and thus indicate the remedy. A good practical knowledge of armature winding is very useful when dealing with repairs, but is not essential.

Some insurance companies require candidates to sit for a written examination of an elementary description, but, usually, an applicant's theoretical qualifications can be suitably judged by the certificates he holds from technical colleges. A tactful manner in dealing with clients when breakdowns occur is a *sine qua non* to the inspector who means to be successful.

Occasionally a breakdown arises which requires delicate handling by the inspector, such as, for example, the case of an attendant examining a motor with a lighted taper, and thereby setting it on fire owing to accumulated wool fluff and oil about the brushgear.

A breakdown policy would not cover damage to windings from such a cause, and unless the owner was insured against fire, he would require to make good the damage, caused by his employee's carelessness, at his own cost.

Such incidents, fortunately, are infrequent, and if the matter is explained in a judicious manner, no feeling of injustice will be left in the mind of the owner.

Many persons, on receiving a policy of insurance, lock it in a safe without reading the printed "Conditions" and "Definitions." These "Conditions" state in legal phraseology that while the insurance company is liable for all breakdowns happening to the machine itself whilst at work, unless caused by habitual overloading, the owner may require to renew, at his own expense, certain parts, such as carbon brushes, commutator, or bearing bushes, which are liable to wear out from time to time.

In conclusion, it may be stated that policies are issued for a year at a time, and it is open to either the insured or the insurer to cancel the policy at the annual date when it falls due for renewal.

This is a valuable safeguard to both parties to the contract, and it tends to ensure smooth working and prevents any high-handed action.

THE GOVERNMENT AND FOREIGN TRADE.

(Continued from page 582.)

We are glad to learn that it is proposed to bring about measures of reform in connection with the *Board of Trade Journal*. We do not wish to underrate its past usefulness, but we shall certainly welcome it in its revised form if it is going to be of real value in circulating articles founded on official information which will help the traders of the country promptly, and if it is going to co-operate with the trade journals—an office which it has filled in an acceptable but limited way in the past.

We presume it will not be long now before the Government is able to announce the names of the twelve new Trade Commissioners from whom we expect so much. We believe that practically all of them will be found to be men of business experience; but until the names are known we shall be unable to estimate how far their qualifications promise well in respect to the great engineering and electrical industries, in the future of which we are naturally more directly interested. We have long observed how valuable have been the services rendered by the four Trade Commissioners acting for us in Canada, Australia, South Africa, and New Zealand, and we trust that now that the number is increased to sixteen, spreading their efforts over wider fields, British industry will be materially advantaged, but our manufacturers and traders will require to show a

full measure of confidence in their ability by availing themselves of the valuable co-operation in information and action which these Commissioners are able to afford them. This remark applies to the period of activity of these officials while in the markets to which they will devote their energies, and also to their visits Home when our firms are able to interview them. Of course, at this date it goes without saying that the Commissioners will require to be most fully informed regarding our industrial manufacturing ability and capacity before starting to take up their posts abroad. It is reasonable to suppose that, however extensive their general knowledge of certain trades may be now, they will have other things to learn before they proceed to the scene of action abroad. It has been obvious in the past that only first-class men will be possessed of the training and experience that will fit them for this very important duty to the State and to industry, and we are glad to know that it is intended that the remuneration and allowances are to be such as to make the posts attractive to men of the required type. As we had occasion several years ago to urge an improvement in the remuneration of our Commissioners, we welcome the more reasonable treatment that is to be meted out to this branch of the Overseas Intelligence Services. It is intended that the Commissioners' extended activities will affect India and some of the Crown Colonies and Protectorates, as well as the self-governing Dominions. The Commercial Attaché Service is also being reorganised and greatly increased in numbers. The control of both these Services has been handed over to the new Department. The improvement of the Consular Service, the need for which everybody recognises, is also being dealt with, but very many matters in this connection require adjustment, and when so many excellent men who could fill such posts with distinction and success are engaged with the Forces, it is not possible to proceed so expeditiously as might have been done were they available now. The Consular Service is not as yet under the control of the new Department, but for the present it has been placed under Sir A. Steel-Maitland's personal charge as Parliamentary Under-Secretary in the Foreign Office. It is proposed that the Commercial and Consular Departments of the Foreign Office shall be definitely assimilated by the new Department when adequate accommodation for the entire new Department has been obtained near the Foreign Office.

There can be no question that Sir A. Steel-Maitland has personally a correct appreciation of what German commercial strategy has been in the past. It is almost impossible to doubt that those who are working under, or in co-operation with, him will have that same understanding of the situation and of the responsibility resting upon us as a nation to be equal to whatever the future may bring forth. This new organisation, given, as we say, goodwill on the part of its different sections, also confidence in its intentions and abilities on the part of traders, should go far to give us the needed measure of Governmental assistance, as regards intelligence service, that is required.

Since the foregoing was written the following official announcement has appeared in the *Board of Trade Journal*:—

The new Joint Department of the Board of Trade and the Foreign Office has now been constituted.

The new Department will be known as the Department of Overseas Trade (Development and Intelligence). It will be represented in Parliament by Sir Arthur Steel-Maitland, M.P., who will occupy the position both of Additional Under-Secretary of State for Foreign Affairs and also of Additional Parliamentary Secretary at the Board of Trade. The Department will comprise the existing Department of Commercial Intelligence of the Board of Trade, including the management of the British Industries Fairs, the War Trade Intelligence Department, the section of the Foreign Trade Department of the Foreign Office dealing with Form K and with other matters relating to the promotion of trade abroad; and certain functions now performed at the Foreign Office in connection with commercial intelligence and with the Commercial Attaché and Consular Services. Sir William Clark, K.C.S.I., C.M.G., has been appointed Comptroller-General of the new Department, and Mr. F. G. A. Butler, C.B., C.M.G., formerly of the Colonial Office, has been appointed Director of the Overseas Division.

The temporary headquarters of the Department will be at 73, Basinghall Street, London, E.C. 2, to which personal letters for Sir Arthur Steel-Maitland should be addressed. The Commercial

Attention is called to the fact (as regards which some misconception has prevailed) that the whole of the rest of the Foreign Trade Department will remain as heretofore under the Controldership of Sir Ernest Pollock, K.B.E., K.C., M.P., at Lancaster House.

Intelligence staff will for the present continue to be housed at the same address. The office at Basinghall Street contains an Inquiry Bureau where information on all matters affecting trade can be obtained on personal application; or inquiries can be addressed there either by post or telephone (telephone numbers, London Wall, 4713 to 4717).

The War Trade Intelligence staff will remain at their existing offices in Lake Buildings, London, S.W. 1.

WIRELESS TRANSMITTING STATIONS ON GERMAN AEROPLANES.

SOME highly important and interesting information on the means adopted by the Germans for signalling between aeroplanes and land batteries, infantry, &c., is given in *La Nature* for December 8th. It is realised, of course, that owing to engine noise, &c., aeroplanes can only transmit, and not receive wireless messages.

The receiving station on the latest type of German aeroplane consists of:—

1. A generator of D.C. and A.C.
2. The oscillating circuit.
3. The antenna.

1. At first the necessary current was provided by a storage battery. Difficulties arose, however; the batteries were very heavy, very fragile, and liable to be discharged rapidly. Small A.C. and D.C. generators were then fitted. These generators are driven by an air screw, or are coupled to the aero motor by a coupling (clutch) operated by the pilot. The generating plant, styled "J. A. Flieg, 1917," by the Germans, comprises two generators mounted on the same shaft. One of these, forming a simple dynamo, supplies the D.C., and is used for exciting the alternator, for the oscillator circuit, and probably also for lighting the lamps and projectors on the aeroplane.

The other generator supplies the A.C. for the oscillating circuit.

The three types of transmitter actually employed are the "Sender" type C, 1916, the "Hüth transmitter," and the "Telefunken transmitter."

Underneath the alternator is a sort of case, into which 12 terminals lead. These terminals permit of inserting in the exciting circuit different values of a resistance placed in series, and housed under the generator.

According to the type of transmitter fitted on the aeroplane, these terminals are used with the corresponding types of current. For check purposes they are connected up by connecting plates corresponding to the transmitter employed, the connectors being small plates of insulating material.

In the cover of the case mentioned above is a small transparent window for observing whether the generator is properly regulated in respect of its oscillating circuit. The generators are constructed so as to work rotating either right or left, according as they are driven by air screws or by the aero engine. The type of generating set just described weighs, with its air screw, cables, &c., 10.3 kilograms (about 23 lb.). The driving screw is designed to give a speed of 4,500 R.P.M. with a wind speed of 150 km. (say 90 miles per hour). Variations of aeroplane speed do not appreciably affect the output of the generating set. The set is air-cooled.

2. *Transmitting Apparatus.*—The "Telefunken" apparatus comprises the usual parts, the whole being contained in a case measuring about 14 in. × 10 in. × 6 in., and weighing some 19 lb. These parts are: a transformer, a condenser, a plate-type spark gap, and a variometer. There is a three-stud contact device for varying the intensity of emission by a rheostat in the excitation circuit, and at the same time decreasing the resistance of the spark-gap by short-circuiting part of the plates.

Another three-stud contact permits of employing three different wave lengths, viz., 150, 200 and 250 metres, by using one or more turns of an Oudin coil. The variometer (variable self-inductance) permits of tuning the aerial with the primary circuit. The observer knows that his circuit is properly regulated when the ammeter pointer attains a maximum.

3. The transmitting aerial is formed by a 1-mm. diameter copper cable about 40 metres long. This wire, which hangs below the aeroplane, tends to assume a nearly horizontal position by reason of its inertia and the wind resistance.

A special arrangement is provided for preventing the antenna swaying, and for ensuring that the correct length is unwound. The manipulator and ammeter are of the usual type. The conductors of this system are insulated and mounted in special flexible aluminium tubes.

The total weight of the complete set is as follows—

Oscillatory circuit	8.7 kg.
Generator system	10.3 "
Aerial, &c.	3.7 "
Manipulator, wiring, and ammeter	3.0 "
			25.7 kg.

or, say, $\frac{1}{2}$ cwt.

The mean range of the set seems to be about 3.5 kilometres, or something over 20 miles.

Every squadron of the German Army Service Corps attached to the air service includes a tractor wagon specially fitted up for dealing with repairs to, and tests on, wireless sets.

The article from which this information is derived is fully illustrated by photographs and diagrams.—E. S. H.

JUSTIFIABLE INDUSTRIAL UNREST.

By G. BASIL BARHAM.

EVERYONE who is in close touch with the engineering trades is aware that a good deal of unrest exists, and that this is due principally to the inequality between the wages paid to those who have been in the shops since boyhood, and who have attained a high degree of skill, and those who have drifted into the fitting and machine tool shops since the war, and who possess neither experience nor special skill. These men are engaged principally on repetition work, and in many instances can earn, with comparatively little effort, more money than those who have been in the trade for years. No one with a sense of equity can endorse a system of payment under which a labourer who merely feeds metal bars into an automatic machine receives more than the skilled supervisor, tool maker, or tool setter, on whose accurate work the correct running of his machine depends. Yet this is the system which obtains in a great number of shops, and countless instances could be given where the difference in wages runs into pounds per week rather than shillings.

Since this inequality was first recognised, a number of movements have aimed at rectifying the anomaly, but neither individually nor collectively have they achieved their object; and it is hardly to be wondered at that the skilled workman, irritated at their failure, has been tempted, in some instances, to take matters into his own hands, and see whether by *force majeure* he cannot bring about a better state of things.

The weapons he has employed have been threats to stop work, threats to stop all overtime, threats to stop dilution, and even to restrict production by less creditable and legitimate means. No talk of payment by results will meet his approval, as he knows that amongst many grades of engineers—especially those possessing considerable skill—piece-work rates or premium bonuses could not be introduced. General fitters and turners, the more skilled amongst the pattern makers, and tool setters are men who could not be paid at piece-work rates, at least for the greater part of their work, although it is true that many of the setters-up and some of the tool-room hands share in the bonus earned by the men in charge of the machines for which they look after the work-setting and the tool-making and setting respectively.

It is time that the employers generally recognised the fact that the skilled workmen are strongly opposed to the establishment of any system of "premium bonus." The Employers' Federation would be well advised to give way

on this point; as a matter of fact, it has little to commend it, and it is generally admitted to be unfair, as under it men only receive a portion, and not the whole, of the value of the time they save for their employers. A man rightly argues that if he, by special effort, succeeds in doing 60 minutes' work in 15 minutes, the value of the saved 15 minutes should belong to him, more particularly as he feels that the employer receives his share of the benefit in the extra amount of work done.

In some parts of the country a scheme of collective piece-work payment has been adopted, and it has met with a certain amount of success in United States shops. It is admitted that American "scientific management" has failed up to now to serve as a medium for reconciling deep-rooted differences between employer and employed; but the system of payment mentioned has many good points. Where adopted, it is arranged that piece prices shall be fixed at such a rate that an ordinary workman can make time-rates plus 50 per cent., these prices being fixed by mutual agreement. A day worker who cannot be placed on piece-rates shall be paid a bonus which shall bring his wages up to the average amount earned by the piece-workers; and although this is merely a bald statement of the scheme, and although it is admittedly imperfect in some respects, it is a scheme which at the present juncture might be introduced with advantage, as it would do away with the majority of labour troubles.

From the employers' side it might be urged that under such a scheme the energy of the piece-workers might result in a higher addition to the wages of the day workers than they expected or demanded, and that, consequently, they would be satisfied with less. To those who argue in that way it is sufficient to say that the war has revolutionised the old ideas as to the relations between Capital and Labour; it will do away with the "Ca'-canny" master as well as the "Ca'-canny" workman, and it is gradually becoming recognised that the labour of the man who works with his brains and the labour of him who works with his hands are both worth exactly what they can obtain. In both cases the only test of reasonableness is the price that can be commanded. Masters must put aside the old idea that the amount of wages paid per week is of any importance, and realise that the only thing that matters is the cost per unit of their production.

REINFORCED CONCRETE POLES FOR TRANSMISSION CABLES.

By A. V. CHITTY.

(Paper read before the ASSOCIATION OF MINING ELECTRICAL ENGINEERS, NORTH OF ENGLAND BRANCH.)

THE colliery where these poles, to be described, have been made and erected has undergone a complete change; for no electricity of any kind had been in use before. The new houses for engines, pumps, boilers, &c., have all been built with reinforced concrete, so that when the poles came to be made everything was ready for the purpose.

As the poles were not required for a few months, one mould served to make them all. The mould was made ready; then as opportunity occurred the concrete was put in, and when finished left to set for about 11 days, according to the weather. A little water was thrown over the concrete occasionally to assist the hardening, and when set sufficiently the box was taken off and made ready for another mould. At this stage the poles were quite "green," and not safe for handling.

The concrete mixer was kept going principally to make concrete for the buildings, &c., but there are periods during work of this description when delays occur, especially at the present time. When the mixer was not supplying concrete to buildings, the concrete was used for moulding a pole.

The illustration gives the dimensions of the pole. Reinforcing rods run the full length, and iron wire was fastened in between the rods to give a better binding. One rod was bent about 1 ft. from the bottom of the base, and brought out at the side. An earth plate was attached to this rod after the pole was erected. At the top the rods project for a short distance to take an iron plate about 3/16 in. thick and 4 in. square. A hole is left in the top to take the top insulator spindle, and a slot in one side to enable the nut

to be secured. A rod was fastened to one of the nuts to carry an overhead earth-wire. About a foot from the top a slot was left to take the cross-arm and a bolt-hole for securing it.

The arms were 2 ft. 6 in. long by 3 in. square, chamfered at the edges, and secured to the pole by a 5/8-in. bolt. Three inches from each end of the cross-arms are the insulators. The shortest distance between the wires, provided they are all at an equal tension, is about 15 in., which for a 440-volt, 3-phase transmission is ample.

The weight of a 28-ft. pole is about 2 tons 7 cwt. Each pole was placed on rollers and moved to its place of erection, care being taken to see that the rollers were fairly equidistant to obviate risk of cracking the concrete, which did happen in one case. The best method is to move the pole on planks strapped to it.

The ground where these poles were set was good solid clay with about 8 in. of soil at the top. The hole was stepped down to about 5 ft., so as to leave a solid wall at the back. The pole was then placed over the stepped side of the hole and set into position by means of a derrick.

A board was placed against the back wall to prevent it burying itself in the ground and breaking the earth away

REINFORCED CONCRETE POLE FOR TRANSMISSION CABLES.

while being lifted. No stay wires were used, as they were not considered necessary in a sheltered colliery yard; also the length of span is only about 40 yds. For a transmission line, say from one colliery to another, through open country, wind stays might be necessary.

One of the reinforcing rods of each pole has an earth-plate attached at the base, and the poles are connected together by an overhead earth-wire which terminates at a steel tower. The wire is taken down the tower and connected to two earth-plates about 20 ft. apart. These plates serve as a central earth for all the surface motors and the underground circuits. It is not necessary for each pole to have an earth-plate, but they were convenient for connecting the motors to. In the case of a long line with a number of poles, an earth-plate at every fifth pole would suffice.

The approximate cost of the pole is about £3 10s., including reinforcement and the mould. A wooden creosoted pole would cost at the present time about 2s. a foot. The life of a wooden pole would be, say, 15 to 20 years, whereas a reinforced concrete pole should last as long as the colliery. For general appearance and strength, concrete is best.—*Iron and Coal Trades Review.*

GAS-FIRING BOILERS.

Mr. T. M. Hunter's paper was read before the members of the BIRMINGHAM LOCAL SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS on December 5th. An abstract of the paper appeared in the ELECTRICAL REVIEW for December 7th and 14th.

In the discussion, Mr. W. N. Y. KING said that an important factor was the question of dust in the flues. In a paper on "Waste-Heat Boilers in Steam Plants," read by Mr. C. J. Bacon before the American Iron and Steel Institute, open-hearth practice was referred to, and it was stated that dust was blown off the tubes every six hours. This was a serious item, as in the case of coal-fired boilers two or three times a week was considered quite frequent for this operation. The result of leaving the dust on the tubes was a great loss of efficiency, on account of reduction of heat transmission; the amount of this was shown in some figures published in the *Electrical Review* and *Western Electrician*, September, 1917, as follows:—

Thickness of soot on tube ...	1/32	1/16	1/8	3/16 in.
Loss of conductivity per cent. ...	9.5	26.2	45.3	69.0

The use of waste products as mentioned had been tried at various times, and the main obstacles to successful working had been reduction of output from the plant due to the large amount of refuse, and the increase in labour costs and difficulty of disposing of the refuse. Even with coal of the quality obtainable at the present day, the handling and disposal of ash and clinker was a serious item of expenditure. The infiltration of air had an appreciable effect on the efficiency; boilers should be fitted with tight casings, and these maintained in good order to reduce losses to a minimum. Explosions, which occurred at times due to unburned gas accumulating in the flues, were not often so violent as to disturb the stability of the boiler, but did affect the walls, loosening the joints, which had to be made good again if heavy losses due to air infiltration were to be avoided.

Mr. A. GOLDIE ENGHOLM said Mr. Hunter had not given any definite information concerning the costs of gas-firing boilers. So far as he was aware, it did not pay to put down gas plant to recover the various by-products unless the plant could deal with, say, two to three hundred tons of coal per day. Mr. Hunter stated that a 30 ft. by 8 ft. Lancashire boiler to evaporate 6,000 lb. of water would require 71,000 cu. ft. of gas per hour at 107 therms per cu. ft. If the gas could be supplied at 1½d. per 1,000 cu. ft., this would work out at about 9s. per hour for the gas alone. He did not think that at present gas at 107 therms could be supplied at 1½d. per 1,000 cu. ft.

Mr. R. L. GOULD said the author emphasised the importance of minimising the excess of air. The admitted air, even when pre-heated, was, he presumed, at a temperature of 100 or 200 deg. C. The excess air had to be raised to a temperature of 1,200 or 1,500 deg. C. The consequent reduction of calorific intensity was obvious. They had to operate between this evil and the evil of unburnt gases in the stack. These unburnt gases probably consisted largely of combustible gases which had been manufactured in the flame, as distinguished from gases which had escaped from the burner. It was conceivable that the wetted surface of the boiler might be the means of so reducing the temperature in a region in which the regenerated gases were liberated that they escaped combustion. The importance of thoroughly mixing the air was emphasised in the paper; this mixing of the air with the gas was, however, a matter of the greatest difficulty, and the regenerated gases escaped combustion on this account also. He suggested an inquiry as to whether the desideratum of substantially complete combustion with a minimum of excess air could be more nearly attained by a gas-fired boiler, the design of which was founded, *inter alia*, upon a recognition of the existence of combustible gases generated in the flame.

LEGAL.

GAS LIGHT & COKE CO. v. THE METROPOLITAN BOROUGH OF HACKNEY.

THE Court of Appeal on Tuesday, December 18th, delivered judgment in this case.

LORD JUSTICE SWINFEN EADY's judgment is abstracted below:—The relators complain that the defendants, who are empowered to supply electrical energy within their districts, are committing breaches of Sections 19 and 20 of the Electric Lighting Act, 1882. They complain that the defendants are supplying electrical energy for lighting on different terms instead of the same terms to persons taking under similar circumstances a corresponding supply contrary to Section 19. They also complain that the defendants are showing undue preference to persons taking current for lighting who also take it for power, contrary to Section 20. Mr. Justice Astbury decided that the relators had failed to give any breach by the defendants of the statutory provisions, and dismissed the action and the relators' appeal.

The scale of charges of which they complain is set out in paragraph 5 of the Statement of Claim, and was contained in

a circular issued by the defendants in July, 1914. The plaintiffs do not make any complaint as to defendants' charges for energy for lighting, or for power alone; their complaint is limited to the provision enabling power users taking current under the B.1 scale to consume up to 20 per cent. of the energy so taken in lighting their factories. The substance of the plaintiffs' complaint can be put in a very few words. They say that if two customers take from the defendants energy for lighting under what they allege to be similar circumstances, as, for instance, if two customers take current for lighting their factories, and one has steam or gas-engine motive power, and the other takes from the defendants electric current for his motive power, the latter is able to obtain his lighting at a cheaper rate than the former. The plaintiffs contend that in such case both customers take energy for lighting under similar circumstances, and ought to be charged at the same rate for such energy. The defendants dispute that both customers take current under similar circumstances, and contend that the customer who takes one combined supply for lighting and power—who takes at least four units for power for each unit for light—is a better customer for the electric station, and takes energy under different circumstances from one who takes it for lighting only.

The plaintiffs' contention is that the defendants ought to have a third scale—namely, an intermediate scale for customers who use current for light and power, higher than the scale charged to power users only, and lower than the scale charged to light users only.

In approaching the consideration of the matter in dispute, it must be borne in mind that customers affect the central supply station differently according to the different circumstances under which they take current. The purpose for which current is taken is immaterial, except so far as the station is affected by the amount taken and the circumstances under which it is taken. An ideally perfect customer would be one whose maximum demand on the station was also his minimum, and whose load remained constant throughout the whole year. Speaking generally, it is agreed that customers for power have a better load factor and more favourably affect the diversity factor of the station than customers for light. A figure of 25 per cent. was accepted as a general figure of load factor for power users. The general figure given as the load factor of light users was 12.5. The diversity factor of the station is, speaking generally, more favourably affected by power users than by light users. It is essential to bear in mind the effect of load factor and diversity factor on the working of an electrical undertaking when considering the scale of charges. It appears that defendants' charge under scale A.1 for lighting is nearly double the charge under B.1 for power. Under A.1, if the unit be taken at 5d. for the purpose of calculating the cost of one hour's supply at maximum demand, and then all current consumed be charged at 1d. per unit, the annual charge per kW. of maximum demand will be £7 11s. 8d., as against the fixed charge of £4 per year per kW. for power, and the charges for current will be 1d. per unit for lighting and ½d. per unit for power. No complaint is made of these charges if enforced for light only or power only, as the case may be. It is now necessary to consider the position of a power consumer who is allowed to use for lighting 20 per cent. of the energy he takes. Sir John Snell, the electrical engineer called by the plaintiffs, agreed that in so far as a power user consumed for lighting 20 per cent. of the current taken, his load was rendered worse than if he used all current taken for power alone, and that, as a class, a power user although consuming 20 per cent. of current for light had a better load factor, a better diversity factor, and was a better customer than one taking only current for light, and he concurred in the view that the average price which should be paid by a consumer taking current for power, and using part of it for light, should be higher than was paid by a customer taking current for power only, and lower than was paid by a customer taking current for light only. The defendants point out that this is the effect of their automatic scale, and that in proportion as the load factor of a power user is rendered worse by his taking current for light, to that extent will he pay at a higher rate for all energy consumed, as the worse his load factor the higher the rate at which he pays for current taken. The table put in by Mr. Merz shows how this works out in the hypothetical instance taken; exactly in the proportion in which the load factor becomes worse, the smaller is the relative quantity of current over which the fixed charge has to be spread, and accordingly the cost per unit of current consumed rises in proportion. Down to this point, I do not understand that the plaintiffs dispute the position. But they contend that this result is arrived at without considering another element, namely, the diversity factor; and they urge that if a customer takes power only at a similar load factor to one who uses current for both purposes, they will both be charged at the same rate for all current taken, although, by reason of the latter customer adversely affecting the diversity factor of the station, he will be a worse customer than the one with the same load factor taking for power only. At most, it comes to this, that given two power users with the same load factor, one only using current for lighting, they pay at the same rate, and thus, it is said, lighting is given at a cheaper rate than it is supplied at to a customer taking current for lighting only. No doubt it is. In my opinion, how-

over, a customer who takes current for power as well as lighting, being a more beneficial customer to the undertaking, and taking at least four units for power for every unit for lighting, cannot be said to be taking a supply under similar circumstances to one who takes for lighting only. Indeed, the appellants conceded in argument that such two customers might be charged a different rate. What seems to be the plaintiffs' real grievance is, not that two light users are charged a different rate, but that two power users are charged at the same rate through each having the same load factor, although one uses part of his current for lighting. Mr. Colefax criticised the use which the defendants' counsel made of the table, and the way they dealt with it in argument. He contended that the table takes no account of the diversity factor, but merely shows that every power user pays according to his load factor, neither more nor less, because the difference of load factor is taken into account in the method of charging. It must be remembered, however, that we start with this—that using current for light as well as power renders worse the load factor. If, therefore, two power users have the same load factor, although one uses current for light, it follows that without using current for light they would have had different load factors, and, as such, would have been charged at different rates if worked out per unit per consumer; it is only by reason of one of these customers also taking current for light, and so adversely affecting the load factor, that he is reduced to the same level or charge as the other customer, who has a worse load factor than his own for power only. The effect of the sliding scale is that it does in fact introduce and adjust a third scale for power and light combined, the charge being higher than would have been the charge for power only, and lower than would have been the charge for light only. The appellants have, in my opinion, failed to show any breach by the defendants of either Section 19 or 20 of the Act of 1882. The case of the Attorney-General *v.* the Long Eaton Urban District Council is clearly distinguishable from the present. In that case, where power and light were both taken, the charge was at a lower rate than when power only was taken, although the consumer was not so good a customer to the station. Again, a difference was made when partial lighting only was taken, so that if any lighting was obtained from any other source the higher rate was charged. The Long Eaton case cannot govern the present one. In my opinion the appeal fails, and should be dismissed.

Lords Justices Warrington and Scrutton also delivered judgments dismissing the appeal, which was accordingly dismissed with costs.

KENSINGTON & KNIGHTSBRIDGE ELECTRIC LIGHTING CO., LTD., v. THE NOTTING HILL ELECTRIC CO., LTD.

In the King's Bench Division, on Wednesday, December 19th, Mr. JUSTICE MCCARDIE had before him this special paper case, which came up upon the consideration of an arbitrator's award adverse to the Notting Hill Co. upon a dispute between the two companies with reference to the use of electrical power from a joint station. The case was reported in the *ELECTRICAL REVIEW* of July 20th, 1917, and the arbitrator's award in that of October 12th, 1917.

Mr. Tomlin, K.C., and Mr. Bruce Thomas were counsel for the Notting Hill Electric Lighting Co., and Mr. Vesey Knox, K.C., and Mr. Marriott represented the Kensington and Knightsbridge Electric Lighting Co., Ltd.

Mr. TOMLIN, K.C., in opening the case, said that he represented the Notting Hill Co. on a special case where an award had been made by Mr. Swinburne. The case arose out of a difference that had resulted between the two companies in reference to their obligations under certain agreements which they had entered into, and under a special Act of Parliament in regard to the same matter. These agreements related to the erection and maintenance of a joint generating station, and the nature of the question in dispute between them was substantially as to whether or not the Notting Hill Co. in certain circumstances had failed to take from the joint generating station the amount of electrical energy which, by reason of their obligations under the agreement and the Act, they were bound to take. It was alleged against the Notting Hill Co. that they ought to have taken more current than they had taken from the joint station, but his case was that one of the purposes for which it was alleged they ought to have taken current, and for which they had not taken current, was a purpose that was outside of the Act altogether, and for which it would never have been possible for the generating station to have supplied current consistent with the provisions of the Act. Under the agreement it was provided that the output of 1,500,000 watts might be used by the companies as they should require, but it was afterwards agreed between the two companies that the Kensington Co. should not be entitled to use more than 1,200,000 watts without the consent in writing of the Notting Hill Co., and the Notting Hill Co. should not be entitled to use more than 100,000 watts without the consent in writing of the Kensington Co. If the joint station was unable to supply the total output required, the companies could take the available output in accordance with the proportions indicated, or in such proportions as might be agreed upon from time to time. Under this agreement, the Notting Hill Co. had taken their maximum, and yet they had been fixed with damages in the

arbitrator's award for not having taken more. After dealing in detail with the various agreements and the provisions of the Acts conferring the powers on the companies incidental to the erection of the joint power station at Hammersmith, Mr. Tomlin said his case was that the Act authorised the acquisition of land and the construction of the joint station for one purpose only—for supplying energy within the areas of supply for the time being authorised, and nothing outside of those areas fell within the scope of the agreements, and any agreement, therefore, for the use of electrical energy supplied by the joint station for some purposes outside of that would have been *ultra vires*. Here the Notting Hill Co. had had damages awarded against them for not taking from the joint station energy for a district that was outside of the statutory area. The fact was, they could not have supplied that district from the joint power station except at enormous commercial loss, as it involved a low-tension continuous supply, and they could not, and would not, have done it.

Mr. VESSEY KNOX, K.C., interfering, said that the arbitrator who had made the award was an experienced electrical engineer; the Notting Hill Co. set up before him the case that they could not possibly have taken this supply from the joint power station, and the arbitrator found against the Notting Hill Co. on that contention. The case for the Kensington & Knightsbridge Co. was that the supply could have been, and should have been, given from the joint station.

Mr. TOMLIN said that their case on this was that the supply could only have been taken from the joint power station at great commercial loss, and the evidence on the other side was also to the same effect. They would not have been able to supply this district at all except for the fact that they were able to make arrangements for the supply from another source. An arrangement was made with the Metropolitan Co. The district in question was the Kensal New Town locality, and the arrangement began about the year 1909. He asked the Court to declare that the arbitrator's decision was incorrect, because energy could not be taken from the joint station for any purpose outside of the area. Counsel proceeded to deal with the effect of the Electric Lighting Act of 1909, which, he suggested, gave a licence to use outside of their area some energy for particular purposes. This licence was to supply at their will and pleasure to particular places. The Kensal New Town district had no characteristics of the statutory area.

Mr. JUSTICE MCCARDIE: So that one of the chief questions in the dispute is whether premises covered by this licence under the Act of 1909 constitute an extension of the original statutory area?

Mr. TOMLIN: Yes—whether those districts come within the area of supply authorised by the agreements and the Acts.

The case was adjourned till Thursday, December 20th.

At the close of the arguments his Lordship reserved his judgment until the 1918 sittings.

THE OSRAM-ROBERTSON LAMP LITIGATION.

Mr. HUNTER-GRAY on December 20th, in the Chancery Division, before Mr. Justice Eve, moved for judgment in two cases in which the Osram-Robertson Lamp Works, Ltd., were the plaintiffs, the first being against the Serena Supply Co., and the second against the Electric Lamp Supply Co. Mr. Hunter-Gray, in reply to the Judge, said that the circumstances were exactly the same as in a case in which his Lordship had previously given judgment. The papers were all in order, and it was a consent order for which he was asking.

His LORDSHIP: Then take your orders.

WAR ITEMS.

Export Prohibitions.—A notice of various additions to and alterations in the list of exports prohibited appears in the *London Gazette* for December 18th.

Experts to China.—Additions to the names of persons and bodies in China and Siam to whom exports may be consigned are published in the *London Gazette* for December 18th.

War Loan.—Big subscriptions to the War Loan during Manchester's great "Tank Week" included £25,000 from the British Westinghouse Manufacturing Co., Ltd., £5,000 from the General Electric Co., Ltd., £25,000 from Messrs. Charles Macintosh & Co., Ltd., and £10,000 from the Chloride Electrical Storage Co., Ltd.

Sale of Electric Heating Apparatus Forbidden in Rome.—The *Times* correspondent at Rome states that a new decree limits the use of electric light, prohibits the use of electricity for heating between 1 and 10 p.m., and forbids the further sale of electric heating apparatus. Gas is already shut off the greater part of the day, and will shortly be cut off altogether for heating purposes. Wood and charcoal are very scarce.

Trading with the Enemy.—In the "London Gazette" for December 21st there appear further lists of persons and bodies with whom trading is prohibited in the following countries:—Argentina, Paraguay and Uruguay, Bolivia, Brazil, Central America, Chile, Colombia, Cuba, Ecuador, Greece, Netherlands, Netherlands East Indies, Norway, Peru, Spain, Sweden, and Venezuela.

Coal Shortage in Germany.—The "Daily Chronicle" special correspondent at Amsterdam says that the gas question is becoming serious all over the Central Empires. Vienna has introduced a gasless 24 hours weekly. Berlin's population has been warned to exercise the utmost economy, as only very small supplies of coal are being obtained. In Stettin gas may only be used for 12 hours roughly out of 24, from 4.30 till 8 in the morning, from 11 to 1, and 4 to 11. Leipzig fares slightly worse, and prospects everywhere are dismal. The reduced amount of gas interferes seriously with various industries, and the situation will become worse shortly, when a reduction in the amount of electricity used is introduced, as is reported will be the case.

Economic War.—In the course of a discussion on war aims in the House of Commons last week, Lord Robert Cecil said (see *Times* Parliamentary reports, December 26th, 1917):—"An economic offensive was quite as important as, if not more important than, any other aim that we had. It was perfectly right to 'bomb' German businesses. The policy of the 'statutory list,' which enabled them to do their best to put out of business German firms in neutral countries, had been one of the main instruments in weakening the economic power of Germany, and in making her look anxiously to the restoration of peace. Neither he nor any other member of the Government advocated an economic war after the war. There was in many respects a world shortage of raw material, and the longer the war lasted the greater would be the shortage. The country would have a right to impeach any Ministry which allowed this country to be in want of essential raw materials because they were being sent to those who had been our enemies in this war. There was nothing vindictive about that. It was a statement of economic fact which it was right to present to the world."

Germany's After-war Trade.—The Central Union of the German Wholesale Trade has issued a series of 20 essays, urging the importance of preparation for the transition period following the conclusion of peace. Imports, it is pointed out in one of these, will involve the payment of large sums to foreign countries. The wholesale trade, however, can make use of its own connections to obtain credit so that payments will be better regulated and more widely distributed. At the same time an effort should be made to export, as far as possible, goods of a high value, such as potash and dyes, whereby credits may be obtained abroad. The problem would be greatly simplified by setting aside a large amount of gold for the use of the importers, if that can be done without injury to the German economic system. Purchases abroad should be made through syndicates, consisting of representatives of both industry and the wholesale trade, and the Government should exercise a certain control over prices. So the Germans propose—but the Allies may dispose otherwise.—*Financier*.

Exemption Applications.—At the Lanarkshire Military Appeal Tribunal, the head electrician at the Royal Princess Theatre, Glasgow, B2, was granted exemption until the end of the pantomime season. He was stated to be the only practical electrician on the staff. He had charge of the network of electrical appliances on the stage, and he had eight unskilled workers under him. It was stated that it would be a source of danger to the public if he were taken. He is not to be called up until March 1st.

The Bispham-with-Norbreck Urban District Council appealed to the County Appeals Tribunal, at Preston, against the decision of the local Tribunal, which refused more than two months' exemption to their electrical engineer, on the ground that it was unreasonable to expect to retain two Class A men for the work. The Chairman asked if it was not possible for the Blackpool Corporation to take over the electrical supply of Bispham in advance of the date agreed upon for the amalgamation of the two areas. The reply was in the negative. The County Tribunal therefore granted temporary conditional exemption to March 31st, by which time winter lighting would be over, and amalgamation would have taken place. It was intimated that the Council would then want a much stronger case to gain any further consideration.

At Skipton, an Addingham electrician and engineer had his appeal refused, and was ordered to report for service on January 1st, with a strong recommendation that he be allocated to the Air Service, which was badly in need of such men.

Before the Essex Appeal Court, the Union Cable Co., Ltd., of Dagenham, appealed for H. Comley (20, Class A), cable machine help; W. H. Rowe (23, Class A), cable armoring machine help; C. W. Dean (24, Class A), lead-press help; G. E. Wheeler (20, Class A), cable armoring machine help; A. W. Taylor (24, Class A), help to cable vulcaniser; W. Matson (24, Class A), lead-press hand; and R. Thorpe (19, Class A), cable machine hand. Mr. Blackwood, the firm's representative, said that it had been found impossible to obtain substitutes. If the men had to go, the work would have to stop. The Military Representative pressed for Comley, Matson, Thorpe, and Taylor, as the Dilution Officer was of opinion that they could be spared. Substitutes had been offered, but had not been accepted. Rowe, Dean, and Wheeler were not pressed for, their claims having been accepted by the Dilution Officer. Mr. Blackwood said that he could not accept the substitutes on the terms under which they were offered. He could not spare any of the men. Mr. Hollick thought that someone who understood the work ought to decide whether or not it was necessary. If it was not necessary, all

the men ought to be in the Army, and if it was necessary older men who were accustomed to the work might be brought out of the Army as substitutes. Conditional exemption was granted in each case until efficient substitutes were found, when the cases could be reviewed.

Before the South Yorkshire Appeal Court, the Military Representative appealed against exemption held by Mr. A. B. Gott (35, B.D.), electrical engineer, and the exemption was cancelled.

At the Shoreditch Tribunal, S. J. Minter (26, single, C.U.), managing director of Stuart (Woodworkers), Ltd., made a third application on business grounds. It was stated that they were now doing a large business in electrical goods, with an ever-increasing trade. At one time the business was run by a man named Baber, and some time back the Tribunal agreed that as he was an A man he could join up, and this man Minter could carry on. This he had done very successfully, the business at the present time being a great success. Captain Weber said the arrangement that this man should stay and carry on was a legacy from a very reprehensible practice of theirs of some time back. Nobody dreamed the war was going to last so long, and they allowed these things. The Chairman said they had been ordered to take all fresh conditions into consideration, and there were clearly fresh circumstances here. The Tribunal decided to grant one month only, final.

At the Shoreditch Tribunal, on Friday, Messrs. W. A. and R. J. Jacobs, Ltd., electricians and electric torch manufacturers, applied that the condition of exemption as to his doing V.T.C. drill should be waived in the case of W. J. Bristow, the manager. He was classed C3. Owing to the heavy pressure of important work, he was unable to do any drilling. They were under the impression that he was not liable in view of the low medical category. The Tribunal declined to take any action in the matter.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

The Production of Ductile Tungsten.

In the lecture given by Mr. Sydney Johnstone at the London School of Economics on the subject of the Rarer Key Metals, as published in the December 2nd issue of the *Daily Telegraph*, the following statement is made with reference to tungsten:—

"A small quantity is employed for the production of filaments for incandescent electric lamps. The manufacture of ductile tungsten for this latter purpose was not carried on in this country before the war."

Mr. Johnstone has evidently been misinformed on this point, because the British Thomson-Houston Co. were supplying their whole requirements of ductile tungsten for Mazda lamp filaments in 1912 by manufacture at their Rugby works. At that time, and until within a month or two from the date of the outbreak of war, the raw material used was tungsten oxide; but the company, foreseeing a possible shortage of that material at the outbreak of the war, immediately started the manufacture of the metal from the raw ore.

This ore, which is of British origin, has always been available in sufficient quantities to supply the needs of the lamp industry. The metal required for tungsten lamp filaments must be of an exceptional purity—far higher than that required for steel alloys—so that the method of refining involved a considerable amount of research and development work before it could be put into regular operation on a commercial scale. This was successfully accomplished, and the whole process of refining the ore and producing ductile tungsten filaments from the metal obtained has now been continuously in operation since the middle of 1915, and many millions of feet of wire have been made.

The British Thomson-Houston Co. not only takes care of its own requirements, but supplies filament for lamps made by a number of its licensees. It has sufficient capacity for supplying far more than the requirements of the lamp industry of Great Britain, if needs be.

Trusting that you may be able to find space for this letter in an early issue,

The British Thomson-Houston Co., Ltd.
Patent Department.

JOHN GRAY,

London, E.C., December 19th, 1917.

Distinctive Colours for Braided Cables.

I have often wondered why the colour of the braiding of electric cable is either red or black. After years of experience, I think that if there were three colours of braiding, it would be of great service to "three-phase merchants."

As the electrical industry moves forward, three-phase plants and installations hold premier place. If a system of using, say, red, black, and yellow wire was followed, it would be an advantage in many ways. All wiring of machines, switchboards, and motor

circuits would be easily followed out, and wiring faults would be nearly eliminated.

In the case of star-delta connected machines and switchgear, three colours of wire would indeed prove beneficial. The leads from the machine would consist of two reds, two blacks, and two yellows. The mains into the switchgear would be one of each colour. In the connecting up of meters on three-phase work, three colours would be of great service. In house-wiring, &c., where the loop-in system is universal, the three colours would be greatly approved of. All feeds could be wired with red, returns with blacks, and switch wires yellow. In the wiring of three-phase automatic controllers, each phase would have its own colour throughout, and this would facilitate the tracing out of what is usually a maze of wiring. We all know the benefit of the various colourings of multicore telephone cable as used for, say, intercommunication systems. Without wishing to have a multitude of colours, I do think that if another colour were added to the V.I.R. cables it would indeed be useful. The colour I suggest is yellow.

I trust that some of your readers will state their valued opinions on this matter.

T. D. Spark.

Newcastle, December 4th, 1917.

BUSINESS NOTES.

Book Notices.—*Manual of Electrical Undertakings*, 1917-1918. By E. Gareke. Vol. XXI. London: Electrical Press, Ltd. Price 21s. net.—The Manual shows no disposition to shrink in proportions. It has arrived at its twenty-first birthday, and is putting on flesh still, judging from its bulkiness. The only change that war and rationing appear to have produced in regard to its general appearance is that its white paper has become grey, but this is not at all a drawback. It contains statistical and general information respecting 2,500 electrical undertakings. The aggregate capital issued by the electrical companies registered in Great Britain is stated at £475,400,320, which is about £5,000,000 less than for the year 1916-17, the reduction being due mainly to the exclusion of companies which are not entirely electrical or British, and to the redemption of debenture capital. There is a section dealing with electrical undertakings in the Colonies. The events of the year are reviewed, financial results of electric light and traction undertakings are summarised comparatively, there are 50 maps, a directory of officials containing about 20,000 addresses, and all the usual interesting features. The work has made its appearance later than usual, but it is stated that advantage has been taken of the additional period to insert various accounts and particulars of a later date than in previous years.

The International Mercantile Directory and Year Book, 1918. Edited by A. M. Pooley, B.A. London: Syren and Shipping, Ltd. Price 5s. net.—This interesting and useful annual, with the sub-title: "The Decimal Book," first issued last year, has been improved in many respects; the commercial information has been widely extended, and the convenient conversion and exchange tables have been expanded. Additions have been made to the tables for converting metric and British measures to other systems, and an explanatory article on the decimal system, by Mr. Harry Allcock, has been inserted. The ground covered by the contents is extremely wide and varied, and the arrangement is very convenient for reference. Anyone engaged in international trade should find the book invaluable.

We have received from the National Electric Light Association, U.S.A., bound copies of the Papers and Reports of the Fortieth Convention, held in New York City, May 9th-10th, 1917, including the following sections:—Technical and Hydro-Electric Section, Commercial Section, Electric Vehicle Section, General and Executive Accounting Section.

"Notes on Screw Gauges." By the Staff of the Gauge Testing Department of the National Physical Laboratory. Teddington: W. F. Parrott. Price 2s. 6d.

"Technologic Paper of the Bureau of Standards." No. 98. Effects of Heat on Celluloid and Similar Materials. Washington: Government Printing Office. Price 5 cents.

"Science Abstracts, A and B." Vol. XX. Part 11. November 30th, 1917. London: E. & F. N. Spon. Price 1s. 6d. each net.

"First Report to the Council of the North-East Coast Institution of Engineers and Shipbuilders on Certain Methods of Producing Vacuum." Newcastle-on-Tyne: The Institution. Price 1s. 6d.

"Tramways and Light Railways Association Journal." The December number contains a list of members and their addresses.

Trade Announcement.—With a view to centralising their business in London the Stanton Ironworks Co., Ltd., have opened an office at Maxwell House, Arundel Street, Strand, W.C. 2, and matters relating to their coal and cast iron foundry business will be dealt with there. Telegraphic address: "Cobbles Eastland London." Telephone number: "Central 6808." Mr. Arnold Longden, who has represented the company for some years on the London Coal Exchange, will, during the period of the war, supervise the foundry section of the business in addition to the coal business. The Foundry Agency arrangement between the company and Messrs. Beck & Co., Ltd., has been terminated.

Tramcar Tires.—According to the *Journal* of the Tramways and Light Railways Association, the makers of tires for tramcars have announced that, in consequence of increases in the cost of labour, fuel, &c., the price of steel tires for tramcars for the first quarter of 1918 will be advanced 50s. per ton.

Lists.—**WESTERN ELECTRIC CO., LTD.**, North Woolwich, London, E. 16.—Postcard executed in colour, showing the Western Electric "Quead" electric fires as cosy comforts for the children. Packets of the cards for correspondence purposes will be furnished to the trade on application.

Liquidation.—**W. C. TACKLEY & CO., LTD.**—This company is winding up voluntarily. Liquidator, Mr. W. Peet, 1, High Street, Croydon. Meeting of creditors January 2nd, at 27, Queen Victoria Street, E.C. 4. Particulars to be sent to Mr. Peet by December 31st.

NATIONAL PROVINCIAL ELECTRICITY CORPORATION, LTD.—Winding up voluntarily. Mr. S. Gillatt, Balfour House, Finsbury Pavement, E.C., Liquidator.

Proposed Industrial Bank.—A report has been issued by the Committee on Banking of the British Empire Producers' Organisation recommending a scheme for a proposed Imperial Bank of Industry.

The general motive of the scheme is to afford readier financial support on sound principles throughout the United Kingdom and the Overseas Dominions and Colonies for producers and manufacturers, and, amongst other results, it is intended that there shall thus be, in any event, no opening for German financial intrigue in obtaining control of any group of industry.

The available capital is to be provided in the shape of debentures and deposits with State guarantee. Further capital will also be accumulated by the funding of profits, as apart from a small bonus to debenture-holders and depositors, all surplus will remain in the bank. Provision is made for government by boards of trustees, on which both employers and employed would be represented. A guarantee and capital of 50 millions sterling is proposed, £25,000,000 guaranteed by the United Kingdom, £6,000,000 each by Canada and Australia, £2,000,000 each by New Zealand and South Africa, and £1,000,000 each by Newfoundland and eight Dependencies and Possessions. The objects are stated thus:—

To strengthen and to extend producing and manufacturing industries already established in the Empire.

To assist in the foundation and development of new industries therein.

To assist by credit facilities in the sale of their products.

To assist them in procuring materials, machinery, and facilities from other parts of the Empire.

To assist in the acquisition within the Empire by its citizens of control and utilisation of its own products.

The foregoing to apply only to companies, firms, and individuals of British origin, whose registration is within the British Empire.

The methods by which the bank would carry out its objects are:—

Making advances by way of cash credits against such security or guarantee as the trustees shall deem sufficient.

Accepting drafts made against shipments or deliveries of industrial products or of materials.

Buying and selling bills of exchange against collateral security.

Issuing letters of credit.

Discounting trade bills.

Purchase of secured time payment accounts or by advances upon the same.

To assist and co-operate with other financial institutions in underwriting the share and debenture issues of present or future industrial undertakings.

To collect and collate information likely to be useful to its customers.

Sterling Workers.—On Friday night and Saturday, at mass meetings of the night and day workers, who assembled in the canteen and new rest room, the managing director of the Sterling Telephone and Electric Co., Ltd., Mr. Guy Burney, who was accompanied by Mr. E. Cholerton (works manager) and Mr. A. W. James (assistant works manager), gave an address of encouragement and congratulation.

Mr. Len Evans, the honorary secretary of the Rifle Section of the Sterling Athletic and Social Club, has been the recipient of a Christmas gift from the members of the section.

During the past few weeks the employees of the Sterling Works, by voluntary collections for deserving objects, have subscribed over £200.

The members of the Sterling Ladies' Foothall Section (A.A.S.C.), who have gone through the first half of the season undefeated, made a Christmas gift to A. Coach.

LIGHTING AND POWER NOTES.

Bath.—The Electric Lighting Committee reports that an offer has been received for the purchase of the Diesel engine plant, but before making any recommendation the Committee has instructed the engineer to inquire if it is possible to obtain the plant he would require to replace the Diesel engine, if sold, in readiness for next winter's load.—*Bath Herald*.

Belfast.—**LABOUR DIFFICULTY.**—On the 21st inst., about 100 men in the Corporation's electrical department went on strike for what is now known as the "Hills' bonus." The strike caused some disorganisation in the lighting and tramway systems, for when the electrical employees decided to "down tools," the coal carters at once struck in sympathy. The lighting and the tramways are carrying on fairly under the circumstances. The electrical department is in communication with the Ministry of Munitions on the subject.

According to Monday's *Times* the dispute was settled on Saturday. **PLANT EXTENSION.**—On the advice of Sir John Snell, it has been decided to scrap a turbo-generator at the power station, which has given considerable trouble. Fortunately, a big turbo-generator is, with the approval of the Minister of Munitions, to be released for the service of the Corporation. Its cost will be about £30,000, and with erection and supplementary plant, &c., the total cost will be about £60,000. The Electrical Committee is anxious to have the new power station at the harbour erected as soon as possible; as an alternative, it may be erected at the end of the Queen's Road on a site originally intended for a gas works.

Canada.—The Imperial Trade Correspondent at Toronto (Mr. F. W. Field) reports that the Ontario Hydro-Electric Power Commission has now in hand preparations for the establishment of its extensive electric generating plant at Chippewa Creek, near Niagara Falls, Ontario.

The Commission is at present only engaged in transmitting electric power from producing companies at Niagara Falls to customers throughout the Province, who take the current and distribute it. With the establishment of the generating plant the Commission will be in a position both to generate and distribute power.

It is first proposed to construct a canal between Chippewa Creek and Queenston, Ontario, at an estimated cost of \$9,000,000, after which the power house will be built and the plant installed. In view of the scarcity of labour and other considerations, the Commission has decided not to employ contractors, but will purchase the equipment necessary to carry on the work, and will undertake the construction of the plant as a public enterprise. The estimated cost of the equipment is \$1,000,000.—*Board of Trade Journal*.

Dublin.—**WAGES.**—At a special meeting of the Corporation it was agreed that the Electricity Committee should adjust on a satisfactory basis the application for increased wages by the technical staff of the electricity department. The Electricity Committee has decided to give the members of the engineering staff the awards granted by the Committee on Production.

East Ham.—**PRICE INCREASE.**—The Electricity Committee recommends increased charges as follows:—Current supplied to general consumers (including public lighting), an additional 13½ per cent. upon pre-war prices, making a total increase of 33½ per cent.; current supplied to tramway undertaking, an additional 10 per cent. upon pre-war charges, making a total increase of 20 per cent.

Haslingden.—**BULK SUPPLY.**—The Council has given notice to the Corporations of Accrington and Rawtenstall to terminate the agreement for the supply of electricity in bulk from December 31st, 1918.

Huddersfield.—**PRICE INCREASE.**—The T.C. has amended a minute of the Electricity Committee, so that the pre-war charges for electrical power and lighting should be increased to an amount to be decided from the date of the December readings of the meters.

Kidderminster.—**PROPOSED POWER STATION.**—At the last meeting of the T.C. the deputy town clerk laid before the members details of a scheme for erecting a large electrical power station on the banks of the Severn, at Stourport. A Bill, entitled the Worcestershire, Shropshire and Staffordshire Electrical Power Bill is being promoted, and Mr. J. A. Lycett, the managing director of the company, in a letter informed the Council that the station, when erected at Stourport, would be the largest power station in England. A member (Mr. Thursfield) said it was important that the progress of the Bill should be watched before Parliament. Ultimately the letter was referred to the General Purposes Committee.

Liverpool.—**DOCK LIGHTING.**—The Mersey Docks and Harbour Board has under consideration a scheme for the electrical illumination of the dock estate.

Luton.—**PLANT EXTENSION.**—The T.C. is to consider a report from the electrical engineer upon the urgent need for extending the electricity station buildings, and providing additional plant to meet the increasing and prospective demand for electricity.

Manchester.—**WAGES.**—As a result of the arbitration proceedings, the Corporation employes in the gas, electricity, water, and tramways departments will receive increases of from 12s. to 16s. per week as from January 1st next.

Rawtenstall.—**PRICE INCREASE.**—The T.C. has revised public lighting charges as from January 1st—viz., a standing charge of £5 per annum per kW. installed, plus secondary charges of 2d. to ½d. per unit, the latter for all above 60,000 units. Private lighting rates are also to be advanced 25 per cent.

Scarborough.—**PRICE INCREASE.**—The Electric Supply Co. announces that after the present meter readings the price of electricity for lighting will be 7d. per unit, for power 2½d. per unit, and for heating and cooking 1½d. per unit.

Southend-on-Sea.—**PLANT EXTENSION.**—The L.G.B. has informed the Council of its willingness to grant, when circumstances permit, the Council's request for sanction to borrow £15,520 for the provision of additional generating plant after the war.

Stratford-on-Avon.—**PRICE INCREASE.**—The General Purposes Committee has recommended by nine votes to four that the Electricity Co. be allowed to increase the price of current from 6d. to 6½d. per unit for the period of the war and a year after, and this has been ratified by the T.C.

Swansea.—At a recent meeting of the T.C., Alderman Martin moved for a reconsideration of the report of the Electricity Committee in regard to the proposed supply to the Harbour Trust, on the ground that the proposed terms would not be remunerative; this was denied in committee, Colonel Sinclair (chairman) and the borough treasurer both urging the advantage of securing the large consumers. The amendment was rejected by a large majority, and the report adopted.

Whitehaven.—**PRICE INCREASE.**—The T.C. has added a war charge of 20 per cent. in the price of current for lighting and power, from January 1st next.

TRAMWAY AND RAILWAY NOTES.

Blackpool.—**TRAFFIC FIGURES.**—The Corporation tramway receipts continue to show remarkable increases. From April 1st to December 13th the receipts were £93,782, which is £12,719 more than last year, and considerably higher than in any previous year. During the past month the receipts per car-mile were 3d. more than last year.

Continental.—**SPAIN.**—Application has been made to the Ministerio de Fomento for a concession to construct an electric tramway between Mataro and Argemona.

East Ham.—**FARE REVISION.**—It is proposed in the New Year to abolish return fares on certain routes, and the West Ham Council is to be approached with a view to abolishing return fares on through-running routes.

Halifax.—**WAGES.**—The tramway employes have made application for a further increase of wages. The present rate is 15s. per week, with bonus, above the pre-war rate; if the application is granted the increase will amount to £1 per week above the pre-war wages.

Huddersfield.—It was resolved by the T.C., last week, that sailors and soldiers should not in future be allowed to ride free on the cars between 12 noon and 2 p.m. and 5 and 6.30 p.m. On the suggestion of the transport authorities the Committee would allow every facility for the carrying of tradesmen's parcels on the cars.

Hull.—**WOMEN DRIVERS.**—The Tramways Committee has decided to appoint a number of suitable women as drivers for the period of the war, in view of the lack of efficient men drivers.

Lancashire.—A conference of a number of Lancashire tramway authorities was held at Manchester last week, but the men's representatives intimated that they would not accept the proposal of a modified service on Christmas Day, and they declined to submit any counter proposals.

LANCASHIRE AND CHESHIRE WAR WAGES.—Over 20 Lancashire and Cheshire authorities are concerned in the award just made by the Committee of Production, on the application of the National Union of General Workers, for a further advance in wages, bringing them up to 20s. a week over pre-war wages. Previously a war bonus of 9s. was being paid, and the offer to raise this to 12s. was declined. The Committee has now granted an award of 7s. per week, making the pay 16s. a week, to commence in January.

Leeds.—A Committee has been appointed to consider the question of the alteration of stopping places and diversion of traffic on the several routes, so that the traffic may be more expeditiously got away from the centre of the city. The question is to be brought before the Ministry of Munitions at an early date.

London.—**L.C.C.**—**TRAMWAY TRAFFIC CONGESTION.**—At the last meeting of the Council the chairman of the Highways Committee said the congestion was due to shortage of material for repairs and shortage of motormen. Wherever possible, motormen were not taken for the Army unless substitutes were provided, but there was no prospect of getting men back from the Front. As to the difficulty at the Victoria terminus, the Committee had asked the Ministry of Munitions to help it in the laying of loop lines, but, owing to the objections of the Commissioner of Police, it was not considered advisable to carry out the scheme.

WOMEN DRIVERS.—The Commissioner of Police is in communication with the War Office, Ministries of Munitions, Labour and National Service, on the subject of the issue of licenses to women to act as drivers of tramway-cars in the metropolitan district.

Rawtenstall.—**FARE REVISION.**—The T.C. is to approach the B. of T. with a view to a general increase in tramway fares.

Snowstorm in the West Riding.—On Sunday and Monday the Huddersfield and Halifax cars only reached West Vale with the greatest difficulty, whilst at Keighley the railless traction service to Oakworth had to be suspended entirely on Monday.

TELEGRAPH AND TELEPHONE NOTES.

New Zealand.—According to the report of the New Zealand Post and Telegraph Department for the year 1916-17, there was a steady extension of telegraphic and telephonic facilities in that period. Forty new offices were opened, bringing the total number up to 2,409 on March 31st last. Ten new telephone exchanges were opened, and two closed. The telephone exchange

system includes 3,897 miles of line and 142,469 miles of wire. The working of the wireless stations continued to be satisfactory. Improved methods of detecting signals by means of the ultraudion were introduced at Awanui, Wellington, and at Auckland; apparatus for other stations has been procured, and will shortly be brought into use. The signals of stations using damped and undamped waves invariably come in of readable strength from American, Asiatic, and European stations. The use of the detecting apparatus with a particular combination of the receiving circuits has demonstrated that daylight signals from stations using the ordinary wave-lengths can be rendered plainly audible, which, by the ordinary methods and the use of the crystal detector, could not be heard.—*Financial Times*.

Holland.—The firm of Siemens-Schuckert has just entered into a £116,500 contract with the Netherlands Government for the installation of a wireless telegraph service between Holland and the Dutch East Indies.

Poulsen Wireless System.—The Italian Government has taken over Valdemar Poulsen's Wireless patent. The owners of the Italian patent are a group of English financiers.

CONTRACTS OPEN AND CLOSED.

OPEN.

Argentina.—February 23rd, 1918. Rosario Municipality. Establishment of telephone service within the municipal radius. Conditions on application.

Bolton.—January 15th. Electricity Committee. One 7,500-KW. turbo-alternator with condensing plant. See "Official Notices" December 7th.

Keighley.—January 9th. Electricity Department. Introduced draught plant. See "Official Notices" December 21st.

Manchester.—January 16th. Electricity Committee. Rotary converter or motor converter plant. See "Official Notices" to-day.

Tipperary.—January 11th. New battery for the Union electric lighting plant. See "Official Notices" December 21st.

CLOSED.

Government Contracts.—List of new contracts placed November, 1917:—

WAR OFFICE.

London.—**POPULAR.**—The entry headed "Stepney" in our last issue requires correction. For *Stepney* read *Peplar*. The amount of Messrs. Bruce Peebles's tender was £3,850, not £3,580.

FORTHCOMING EVENTS.

Junior Institution of Engineers.—Friday, December 28th. At 8 p.m. At 39, Victoria Street, S.W.1. Paper on "Water Circulation in Boilers," by Mr. H. Josling.

Friday, January 4th. At 8 p.m. At 39, Victoria Street, S.W. Paper on "Some Aspects of Lubrication," by Mr. H. E. Cosgreave.

Royal Institution of Great Britain.—Saturday, December 29th. At 8 p.m. At Albemarle Street, Piccadilly, W.1. Christmas Lectures, "Our Useful Servants: Magnetism and Electricity"; "Electricity and Electric Currents" (II). Tuesday, January 1st, "The Electric Current as a Heater and Chemist" (III). Thursday, January 3rd, "Electricity as an Illuminator and Doctor" (IV). Saturday, January 5th, "Electric Dynamos, Motors, Transformers and Railways" (V), by Prof. J. A. Fleming, F.R.S.

ELECTRICITY SUPPLY ORGANISATION.

FOR some time past the future of electricity supply in Britain has been the *pièce de résistance* of British electrical journalism, and naturally so, for apart from the broader aspects of the matter, it must be recognised that any great extension of supply facilities will, with a moderate amount of business organisation, result in unparalleled prosperity to by far the most important section of the electrical industry. As regards the actual steps taken to secure this future, the past year or two has been marked by conference and negotiation, by a hopeful measure of co-operation, and not least by the realisation on the part of the Government of the invaluable character of the services which an adequate supply of electricity can render in promoting the prosperity of the nation.

It is at least certain that the various committees which have taken this matter in hand will amongst them evolve a scheme or schemes for the production and distribution of electricity on more advantageous terms and on a much more extensive scale than has been possible in the past—more one cannot say at present.

So much for the technical aspect of the matter, the importance of which will be granted. But what of the other side—the equally important question of providing the indispensable market for the commodity which we hope to see in universal use?

Can we claim to have made the slightest effort to secure the greatly extended outlet for the vastly increased amount of energy which should be available if our schemes mature, and on which, in fact, the maturing of such schemes absolutely depends? We think not; we are in effect preparing to hurry up production, while leaving sales to take care of themselves—an inconsistent procedure which will not commend itself to the commercial mind for one moment. The future of electricity supply absolutely depends on the commercial stability of the great undertakings which may arise from our present efforts; business in hand and business in prospect are essential to satisfactory finance; the business end of electricity supply, especially the potential demand for electricity, is the foundation on which all our schemes for the future depend. Yet we cannot point to any concerted action whatever by the supply industry of Great Britain, with a view to securing its position in this respect. The electricity supply situation at the moment appears to be as follows:—

PRODUCTION OF ELECTRICITY ON A LARGE SCALE.

SALE OF ELECTRICITY ON A LARGE SCALE.

We have the Board of Trade Electrical Supply Committee; the Interconnection Committees of Lancashire and Cheshire, Yorkshire, West of Scotland, South Wales, West of England, North-East Coast, Devon and Cornwall, &c., and the Provincial Electric Supply Committee, backed by the I.E.E., the Municipal Electrical Association, and the Associated Power Companies, working for the unification and co-ordination of supply by interconnection, bulk supply, and the utilisation of available waste heat sources, to the end that an abundant supply of electricity shall be available for all classes of consumer in the United Kingdom.

?

Let us make no mistake: if the schemes at present under consideration are ever realised, the electric supply industry of Britain will become the *greatest industrial organisation in the country*. A great and organised business will have to be developed from the initial stages represented by some hundreds of supply undertakings, which are isolated units as regards their commercial management, and have no effective organisation for the co-operative effort which is obviously indispensable to the success of the larger project.

Looking round at our potential business, we may say as regards:—

Lighting.—At the present time a generous estimate of electricity consumers is $2\frac{1}{2}$ to 3 per cent. of the population supplied: the comparable figures for gas consumers are 25 to 29 per cent., so that there are, roughly, ten times as many consumers of gas. As we know that the majority of the latter are lighting consumers, it follows that we have only touched the fringe of the possible electric lighting business of domestic consumers.

Cooking and Heating.—Pioneering efforts have been fairly successful, especially with large installations, a recent estimate placing the latter at about 400 installations, of 22,000 KW.: domestic electric cooking, satisfactory, though in its initial stages, awaits co-ordinated effort and organised manufacturing and salesmanship: domestic electric heating has progressed with the rise in fuel values, but is only in the initial stage, while domestic water heating as a popular proposition is strictly a problem of the future.

Domestic Power.—Practically untouched: a very small motor, which is not a toy, and yet sells at a reasonable price, is badly needed.

[Generally, it may be said that the domestic consumer has been practically unexploited. Take an actual example: A consumer who used 400 units per annum for lighting, increased his consumption to 7,000 units a year, with electric cooking and heating, and thermal-storage water heating added, doubling his load factor and paying an average of $\frac{3}{4}$ d. per unit, the rates being—l., 5d.; c. and h., 1d.; t.s., 0.3d.]

The war has emphasised the importance of "domestic engineering" as a means of avoiding labour strain in the household. Due to the lack of initiative of the supply industry, the enormous advantages of electricity for light, power, and heating are not realised by the general public, while the architectural profession, on which much depends, has made no special study of the influence of electrical methods on domestic economy.]

Factory Driving.—This is the most progressive branch of electricity supply, but still offers immense scope for development, if Dr. Crowley's statement that only one-half of 1 per cent. of the power required by our textile factories is purchased from supply undertakings is any indication.

Mr. Robertson, at the last I.M.E.A. Conference, assumed that 13 million H.P. were employed in factories at the present time, and Mr. Selvey showed that if only half this were supplied electrically under average conditions, some 8,500 million units per annum would be required, which contrasts with the present output of all statutory undertakings, for all purposes, of 2,000 million units per annum. The result of intensive development of considerable areas, with concentrated and scattered coal, iron, and steel industries, can be judged from the work of the N.E. Coast power companies. As regards individual cities, we have a recent estimate from Leeds that nearly 40 per cent. of the power used in the city is supplied electrically: in Bury, a textile centre, Mr. Watson estimated that 20 per cent. of the power used was electrical.

In 1906, a canvass of factory power users in the County of London showed a total of 208,800 H.P., or 156,000 KW.: in 1913, Mr. Frank Bailey stated that the electrical power connections in that area amounted to 135,000 KW., or 86 per cent. of the foregoing amount.

Power estimates must, however, be treated with reserve: industrial power requirements are constantly growing, and factories show a tendency to move outside town areas.

Industrial Heating.—In its initial stages: it was estimated that 90 electric steel furnaces were in use in January, 1917, as against 7 in 1910. [It is stated that the electric furnace load at 51 steel mills in the U.S.A. amounts for 300 million units per annum.] Industrial low-temperature heating for baking, drying, annealing, tempering, melting, &c., also for electric welding, brazing, &c., offers great possibilities for development, and is little appreciated as yet in this country.

Electrochemical Work.—An established industry on a small scale; modern views on the development of the carbide, nitrate and other chemical industries will, if they materialise, lead to an unprecedented expansion of electricity supply for such purposes in the future if the price of energy can be brought low enough.

Electric Tramway Traction.—Offers little scope for development, under present legislative conditions.

Electric Railway Traction.—One of the most important fields of future electrical development: partial suburban electrification at London, Manchester, Liverpool, and Newcastle: no main line electrification yet undertaken.

Electric Vehicle Traction.—In its initial stage. About 1,000 vehicles in use, or on order, as against 150 in 1914.

Offers enormous opportunity for development: progress due to organised effort of Electric Vehicle Committee of Great Britain, but its advantages still unrealised by the carrying public.

While we have only roughly surveyed the position, it is possible to deduce from it the fact that huge opportunities exist for future business in electricity supply: much of this business is, no doubt, a legacy of the *laissez faire* conditions existing in the electrical industry in the past, and the latter would, as a whole, have been incomparably better off to-day had initiative, enterprise, and patriotic support for its objects been more conspicuous features of its policy.

We shall never realise the progressive future which has been sketched out for us unless our electricity suppliers abandon the haphazard individual methods of the past, and adopt some common-sense proposal for establishing a community of interests, to develop their general business policy and popularise their dealings with the public.

The sale of electricity depends on the appreciation of the public, and the supply industry must realise that the latter is virtually in partnership with it, and demands to be taken into its confidence sufficiently to appreciate what it is doing and why it is doing it.

Now, while the private interests of the various elements composing the electricity supply industry in this country may not be reconcilable to any extent—and the petty jealousy of adjacent municipal authorities is quite as serious an obstacle to harmony as the rivalry of municipal and company interests—yet the business interests of all concerned, as regards their dealings with the public, present a sufficient similarity to justify the formation of a suitable organisation to give common expression to these common aims at least.

Whether this organisation is on the lines of the British Commercial Gas Association, or of the American Society for Electrical Development, or is a British counterpart of the more ambitious American National Electric Light Association, is immaterial at the moment, so long as an association is formed which is representative of the supply industry as a whole, for the purpose of directing and supporting the efforts of our undertakings to develop electricity supply with a view to the benefit of all.

We have in our midst several associations connected with electricity supply. If the strongest of these—for someone must make the first move—were to invite the others to join it in a preliminary discussion of the subject, this would serve, if no other purpose, at least to enlighten us on the peculiar conditions, which we have evidently overlooked, but which presumably exist, to prevent a great industry—the members of which have one common object in view—from adopting methods which every comprehensive industry finds it essential to adopt, and which, in fact, American central-station interests adopted many years ago in their dealings with the public.

It may be that there are still many in the industry with a limited outlook, many who do not realise that from little private plants, supplying a favoured few, our undertakings are growing into public utility corporations with responsibilities of a national character and Government interest behind them, whose business is not only the sale of energy but also to serve the public in all matters appertaining to electricity supply. To all such we appeal to take the broad view: it is the turn of the big town to-day, but it may be the turn of the small one to-morrow, if it offers the facilities and enterprise which are attractive to new industries. Above all, we would urge those engineers who favour the mole in their methods of dealing with the public to remember a certain old American saying that:

He who whispers down a well
About the goods he has to sell,
Won't reap the gleaming, golden dollars
Like him who climbs a tree and hollers.

Electric Postal Vans in Switzerland.—The Postal Authorities of Zurich have lately put in service a couple of electric motor vans, built by Messrs. A. Tribelhorn, of Feldbach, who are described as the only manufacturers of this type of automobile in Switzerland. Similar vehicles are also said to be in hand for the Postal Service in Geneva.

Electricity and the Growth of Crops.—According to the report of the Development Commissioners for the year ending March 31st last, among the grants made was one of £1,330 to the Imperial College of Science and Technology for an investigation into the effect of electrical discharge on the growth of crops,

OUR HALF-YEARLY INDEX.

As it is necessary to effect every possible economy in paper consumption, the Index to Vol. 81 of the *ELECTRICAL REVIEW*, which will be printed in the course of a few weeks, will be supplied only to those who, through the post, specially apply for it. To such it will be supplied for 3d. post free. Any reader or advertiser at Home or Abroad who requires a copy for binding, or for other purposes, is asked to make application therefor promptly to: The Publisher, *ELECTRICAL REVIEW*, 4, Ludgate Hill, London, E.C. 4.

NOTES.

Educational.—**BIRMINGHAM UNIVERSITY.**—At the annual distribution of certificates at Warwick School, Sir Oliver Lodge, in congratulating the successful boys, said he was much impressed by the almost luxurious provision in the school for the teaching of chemistry and physics. He hoped this development in scientific instruction would, among other things, blossom in the application of science to agriculture, for the teaching of which there would shortly be a chair at Birmingham University. The one thing that had been neglected in this country was the scientific and thorough cultivation of the land, with the aid of which the country might nearly feed itself. He hoped Mr. Fisher's Education Bill would be passed without too much delay and that Mr. Fisher would deal with the Universities, because education needed to be reconstructed from top to bottom.

The A.E.G.—Apart from the political remarks on the general situation which Herr Walter Rathenau made, at the request of certain shareholders, at the recent general meeting of the A.E.G., very little information of external interest is reported in the German newspapers as having been laid before the assembly. As in former years, a small minority condemned the accumulation of such large disclosed and undisclosed reserve funds, it being urged that a higher dividend than 12½ per cent. should be paid, seeing that at the present quotations the shares only yield about 5 per cent. The question of the disposal of the large interests held in the Electro Works was explained by the chairman at some length, and the impression to be formed from his observations, is that if the company has made some financial sacrifice in transferring the undertaking to the Government, the directors are glad to be relieved of what had become a burden under the effects of the war. A third matter referred to was raised by a representative of the staff, who advocated the grant of an increased war bonus to the employes, but the chairman ruled that the subject could not be discussed in general meeting, as it was one for the managers and the Committees or the Conciliation Boards. The political part of the chairman's speech closed with the remark that "our foreign business lies in strong hands in which we trust." Such an observation was undoubtedly true all over the world prior to the outbreak of war. It is, we believe, none the less true now in so far as neutral countries are concerned, particularly in South America, owing to the formation of native companies, the German interests in which it will be difficult for transmarine States to eradicate, if they are fully disposed to take this step in those cases where South American countries have recently joined the Allies or discontinued diplomatic relations with Germany.

Magneto Flash Lamps.—Referring to our article on this subject, published on October 26th, Mr. F. Westmoreland, from whose article in the *Model Engineer and Electrician* we obtained the illustrations of an actual example, points out that the drawings were made and supplied to him by Mr. Thos. Hindle, of Manchester, the owner of the lamp. We understand that the question of manufacturing such lamps in this country is under consideration.

The Effect of Heat on Celluloid.—A new publication of the U.S. Bureau of Standards (Technologic Paper No. 98), entitled "Effects of Heat on Celluloid and Similar Materials," contains a study of the behaviour of celluloid, and of pyroxylin plastics in general, when heated to different temperatures, commencing in the neighbourhood of 100° C. Above this temperature the heat of decomposition may raise the temperature of the mass to the ignition point. At 170° C. decomposition takes place with explosive violence. Pyroxylin plastics can be ignited by momentary contact with bodies having a temperature of 130° C. and upwards. The rate of combustion is five to ten times that of poplar, pine, or paper under the same conditions. The vapours evolved during the decomposition of pyroxylin plastics are poisonous and extremely combustible, and may be ignited by the heat of decomposition. A copy of the paper may be obtained by those interested by addressing a request to the Bureau.

Tracing Linen for Bandages.—Understanding that tracing linen used for plans is useful for bandages for wounded soldiers, Westminster City Council has authorized the engineer to go through the old plans and dispatch to the hospitals any old tracing linen of no further use as official records.

Many of our readers are probably in possession of large quantities of old tracings which could thus be usefully turned to account.

Volunteer Notes.—**COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).**—Headquarters, Balderton Street, Oxford Street, W. 1.

Orders for the week ending January 5th, 1918, by Lieut.-Colonel C. B. Clay, V.D., commanding:—

Officer for the Week.—Lieut. C. E. Campbell.

Next for Duty.—Lieut. W. J. A. Watkins.

Monday, December 31st, 1917.—No. 3 Company, 6.30—8.30. Recruits' drill, 6.30—8.30. Signalling Section, 6.30—8.30.

Tuesday, January 1st, 1918.—Lecture on "Demolitions," 6.30, by Capt. Fleming. Physical drill, 7.30.

Wednesday, January 2nd.—No. 1 Company drill, knotting, and lashing, 6.30—8.30. Recruits' drill, 6.30.

Thursday, January 3rd.—No. 2 Company drill, knotting, and lashing, 6.30—8.30. Recruits' drill, 6.30. Signalling Section, 6.30—8.30. Ambulance Section, 6.30—8.30. Medical examination of recruits, 6.30—8.30.

Friday, January 4th.—Musketry, 5.30—8.

Saturday, January 5th.—Entrenchments, &c., 2.45—4.45. Recruits' drill, 2.45—4.45.

Sunday, January 6th.—Commandant's parade at Waterloo Station (opposite No. 10 Platform), 8.45 a.m., for work at Esher. Uniform, haversacks, and water bottles and mugs. Mid-day rations to be carried.

Note.—All drills and parades will be at Headquarters unless otherwise stated. Recruits will attend for engineering instruction with the companies.

(By order) MALEOD YEARSLEY, Capt. and Adjutant.

Communication with Aircraft.—It is reported that the French Army has recently introduced a novel form of miniature searchlight, operated by electricity and equipped with a telescope. When in use the searchlight is held in the hands of the operator, so as to bring the telescope into sighting position. The searchlight is aimed at the aircraft with which communication is to be established and maintained, and the operator then sends the messages by means of a tapping key on the side, causing long and short flashes of light to spell out the words or numerals in the telegraph code used. By means of the telescope the operator is able to see the distant flashes of the answering searchlight, and in this manner two-way communication is maintained as long as desired. The new signalling equipment is light in weight, consisting of but the searchlight and battery, and therefore readily portable.—*Aircraft.*

A Hut for Signal Service Officer Cadets.—The Administration Officer at the Headquarters of the Signal Service Officer-Cadet Company, R.E., Lieut. F. S. Paterson, R.E. (late of Messrs. Johnson & Phillips) informs us that the present establishment includes Canadians, Australians, South Africans, and men from other parts of the world, as well as from the British public schools. During his course the Officer-Cadet has to become technically efficient, besides undergoing a strenuous training, and there is an urgent need for accommodation to enable the Cadets to study during the evenings and the week ends, as the technical knowledge of modern methods and apparatus for communication that they must acquire is very extensive and detailed. Lieut. Paterson, therefore, appeals for a hut for, say, 100 Cadets, with a suitable equipment for the purpose described above. The Signal Service Officer-Cadet Company is closely associated with the electrical industry, and its members are worthy of the strongest support. We earnestly commend the matter to the notice of our readers, especially those engaged in the instrument and cable-making trades, to whose sympathies the project should appeal. Lieut. Paterson's address is Cadet Company, R.E., Haynes Park, Bedford.

Institution and Lecture Notes.—**Royal Institution.**—The official list of lecture arrangements up to Easter, 1918, has been issued, and contains announcements of the following events:—

At 5.30 p.m.

Friday, January 18th.—"Studies on Liquid Films," by Prof. Sir James Dewar, F.R.S.

Friday, January 25th.—"The Motion of Electrons in Gases," by Prof. J. S. Townsend, F.R.S.

Friday, February 8th.—"Science and Ethics," by Principal E. H. Griffiths, F.R.S.

Friday, March 8th.—"Vibrations: Mechanical, Musical, and Electrical," by Prof. E. H. Barton, F.R.S.

Friday, March 22nd.—"Radiation from System of Electrons," by Prof. Sir J. J. Thomson, Pres. R.S.

At 3 p.m.

Tuesdays, February 25th and March 5th.—"The National Physical Laboratory: (1) A National Laboratory of Industrial Research; (2) A National Proving House and Standardising Laboratory," by Sir R. T. Glazebrook, F.R.S.

Saturdays, January 19th and 26th.—"The Chemical Action of Light," by Prof. W. J. Pope, F.R.S.

Saturdays, February 16th, 23rd, March 2nd, 9th, 16th, 23rd.—"Problems in Atomic Structure," by Prof. Sir J. J. Thomson, Pres. R.S.

The first of the series of six Christmas Juvenile Lectures on "Our Useful Servants: Magnetism and Electricity," was delivered by Prof. J. A. Fleming, F.R.S., yesterday afternoon.

Institution of Electrical Engineers.—A meeting of the NEWCASTLE-UPON-TYNE LOCAL SECTION was held on December 18th, the chairman, Mr. A. H. Marshall, presiding. A reception was held by the President of the Institution, Mr. C. H. Wordingham, who was supported by Mr. Marshall, and, subsequently, the President addressed the gathering. After having thanked the members for their very cordial reception, he said he felt that it was desirable that the Local Sections should be cognisant of what was going on in London. There was a persistent tendency on the part of a section of the electrical Press to belittle the Institution, which he did not think was conducive to its best interests, but was rather mischievous. Constructive criticism was a good thing, and there was nothing he liked better than honest criticism, but when they saw the Council of the Institution always attacked, and it seemed that it could not do right, there grew up a feeling which spread like a canker, and the members felt that the Council was no good. The influence of that section of the Press was not beneficial, but undoubtedly mischievous. If the Institution were to progress, they must have loyal support. They had seen various organisa-

tions go ahead, and he thought the reason for it was to be found in their extremely pushful policy. That Institution could not afford to sit down and wait for something happening, but must go ahead. At the present time, if they wanted to deal with any question they were not able to command the whole of the sections of the industry; he did not know why, but they could not. It was, therefore, necessary to get them together. He felt it was essential to carry all sections of the industry in anything they had to do. In adopting such a pushful policy they must take risks, but nothing was more deadening than the feeling that they must not attempt so and so because "it might fail"; or because "years ago they had tried it, and it had failed," or because some questioned its wisdom—they must take some risks. The first step, he thought, to a wider influence, and a better position, was to obtain a Charter. He referred to that in his inaugural address, and he found he had the Council with him. If they could, they would go in for a Royal Charter. Referring to some of the activities of the Institution, and speaking of research work, the President said the question of insulating materials had been before them even before the war, and the outbreak had greatly emphasised the need of research upon this question. A Joint Committee had been formed of three members of the B.E.A.M.A. and three of their members, and their harmonious efforts were making steady progress. The relations between their Research Committee and that of the B.E.A.M.A. were wholly cordial. He had suggested the appointment of a research organiser, a man of scientific training, with engineering experience, whose function would be, not to interfere with anything that was existing, but to act as a go-between, to co-ordinate the work, and to give some impetus to it. It was impossible for the chairman of the Committee, or for the permanent officials, to give the time that was needed. The research organiser would see that the research workers had the facilities they required, and the materials they required, in proper form and carefully prepared. There had also been a good deal of hard work done with regard to standardisation. This included high-pressure switchgear, and he thought it would be most unfortunate if British standards were not fully borne in mind. The purely British switchgear produced in that neighbourhood had set before it a maximum ideal of switchgear. The margin of safety was greater than in general practice, but either that margin of safety was necessary or not, and in that connection a great deal of research work was required. He thought it would be an excellent idea if there could be set up in that district an Advisory Committee able to undertake research work into switchgear, with a view to advising the Committee on this matter. The President concluded with a reference to the desirability of the establishment of a Proving House, which would only give its hall-mark to gear produced by British makers, and which would show that that type of article had conformed to the standards laid down by the Standards Committee. The President was cordially thanked for his address, on the motion of Mr. H. W. Clothier.

Association of Mining Electrical Engineers (West of Scotland Branch).—On Saturday, January 12th, Mr. J. H. C. Brooking will read a paper on "Cable Complaints." There will be a display of cable joint-boxes and a demonstration of repairing of cable trailing cable.

Appointments Vacant.—Shift engineer, for the Lancashire Electric Power Co. (£17 per month); Head of the Electrical Engineering Department of the Loughborough Technical Institute (£220 + £30 war bonus); mains assistant, for the Borough of Dover Electricity Department; district electrical engineer, for the War Department, South Irish District; teacher for the training of disabled soldiers in electrical work (£4) for the Middlesex Education Committee. See our advertising pages to-day.

A Novel Use for a Motor-Car Electric Lighting Set.—The testers at the Fiat Motor Works in Turin, Italy, have discovered a new use for the electric lighting sets on motor-cars, which will doubtless be of interest, and serve as an example, to car owners in this country. These men are called upon to test cars in extremes of weather and temperature, and as motor chassis under test cannot be fitted with wind-screens, the problem of keeping warm while driving on Alpine roads is one of no small order. The Fiat testers are now, consequently, being supplied with electrically-heated gloves, the necessary current being drawn from the electric lighting equipment on the car. The gloves have resistance wires set in the back, between two layers of thin sheet asbestos; connection is made to the electric light terminals at the most convenient points, and the fine flexible wires are attached to the wrist of the gloves by means of press-on buttons. The wires are of sufficient length not to interfere in any way with driving, and the current passing through the resistance is said to keep the hands at a warm temperature even on the coldest day. When it is necessary for the driver to leave the steering wheel of the car, the wires can be instantly disconnected from the gloves merely by a pull on the press-button connections. A similar method of obtaining warmth has been adopted by military aviators, whose clothing is now electrically heated on much the same plan.

The Functions of a Borough Electrical Engineer.—As we go to press we have received the following letter:—

"My attention has been called to a letter in your last issue purporting to be signed by Mr. H. Brand, and headed 'The Functions of a Borough Electrical Engineer.'

"In fairness to the borough electrical engineer, the public should know the true facts, which are as follows:—

"My company had an inflated claim made against it by Mr. Brand, who, when he could not get his exorbitant demand satisfied, issued a summons in the East Gravesend County Court

"The matter, on behalf of the company, was placed in the hands of Mr. George Clinch, solicitor, who advised a quite reasonable amount being paid into Court, and that a subpoena should be issued for the attendance of Mr. Melnes as an expert. This was done, and Mr. Melnes was served, and therefore was bound, under a very heavy penalty, to attend. He had no option.

"The judgment shows very clearly what the Judge thought of Mr. Brand's claim.

"ARTHUR GREEN,

"Manager and Secretary, Grand Theatre of Varieties (Gravesend), Ltd.

"Gravesend, December 24th, 1917."

[We are pleased to publish this letter, which gives an entirely different aspect to Mr. Melnes's connection with the case. We may add that, according to our present information, far from knowing "absolutely nothing of the case," Mr. Melnes was consulted by the theatre company as to the working of certain electrical apparatus, and advised the company as to the repairs that were necessary, before the work was entrusted to Mr. Brand: he was, therefore, fully conversant with all the circumstances and in a proper position to give professional evidence as to the facts.—EDS. *ELEC. REV.*]

Explosion at Krupp's Power Station.—Press dispatches from Holland state that an explosion which occurred at the electric power station at Krupp's, at Essen, seriously damaged the building, also that the works were set on fire.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—At a meeting of the Birmingham Electric Supply Committee on December 19th, MR. ERNEST JOHN JENNINGS, the secretary of the St. Marylebone electric supply undertaking, was selected to be recommended to the City Council at their meeting on January 8th for appointment as secretary of the electric supply department, in succession to Mr. Howard Foulds, who leaves at the end of the year to take up his new position in London. There were 266 applicants for the post, and three candidates were interviewed by the Committee. Mr. Jennings, who is 46 years of age, has held his present position at Marylebone for 13 years. Previously he was in the employ of the St. Pancras electricity undertaking. At the same meeting the Lord Mayor presented to MR. FOULDS a copy of the following resolution, engrossed on vellum, and signed by the Lord Mayor and the chairman of the Committee:—

Resolved unanimously, that the Electric Supply Committee of Birmingham receive with great regret the resignation of Mr. Howard Foulds as secretary of the electric supply department, and desire to place on record their high appreciation of the energy, ability, and tact with which he has successfully performed the duties of that office since his appointment, which has covered a period of over seven years. This period has witnessed an exceptional development in the operations of the electric supply undertaking, first, owing to the extension of the city and the absorption of the Aston Manor and Handsworth electric supply undertakings, as well as carrying the operations of the department into a large portion of the areas of Yardley and King's Norton; and, secondly, owing to the exceptional demand for electrical energy which has arisen during the progress of the present war. The work that has fallen upon the shoulders of Mr. Foulds has been heavy and responsible, and the Committee are pleased to recognise that he has fulfilled the demands made upon him to their complete satisfaction; they consider that the department has gained in efficiency by his efforts, and he will leave behind him a record of work which will be remembered and appreciated by the Committee and his colleagues, and they assure him that he enters upon his new appointment with their best wishes for his future prosperity.

Riford U.D.C. has confirmed the engagement of MR. W. GREENWOOD as temporary third engineer in charge, at £150 per annum and war bonus.

The Heston and Isleworth E.C. recommends that the salary of MR. E. W. JAMES, power station engineer, be increased to £250 per annum, rising by annual increments of £25 to £300; and that MR. T. W. GANDER, mains foreman, be granted an increment of £12 10s. per annum, with subsequent increases of £12 per annum to a maximum of £200.

MR. RUDOLPH THOMSON, shift engineer at the power station of the Lancashire Electric Power Co., has been appointed charge shift engineer at the L.C.C. generating station at Greenwich, at £250 per annum, rising to £300 per annum.

Barnes U.D.C. has increased the salary of the assistant electrical engineer to £300 a year, plus a war bonus of 7½ per cent. per annum.

MR. J. RENSCHAW, of the Bury Corporation electricity works, has been appointed chief assistant at the Fleetwood electricity works.

It is announced in the *Financial News* that MR. F. DUDLEY DOCKER, C.B., of the Metropolitan Carriage, Wagon, and Finance Co. Board, has joined the directorate of the British Westinghouse Electric and Manufacturing Co., following the financial interest taken by the Metropolitan Co. in the British Westinghouse Co., whose American-held shares the first-named company lately acquired.

MR. J. W. DARLING has resigned his position with Messrs. Jonas Brook & Bros., Meltham Mills, and has joined the staff of Messrs. John Baker & Co. (Rotherham), Ltd., at Kilnburst Steel Works, as electrical engineer.

General.—The *Times* announces the engagement of **LIEUT.-COLONEL ARTHUR FAWCUS, M.C.**, second son of the late Mr. James Fawcus, to Miss Alexandra James, of West Dean, Chichester.

MR. C. J. HUNT, chief engineer to Messrs. Bruce Peebles & Co., Ltd., was married on 22nd inst. to Miss Marion V. Lambert, of Edinburgh. Mr. Hunt was presented with a case of cutlery by the officials and staff.

Roll of Honour.—**RIFLEMAN H. ALLEN**, 11th K.R.R., served his apprenticeship in the composing department of the *ELECTRICAL REVIEW*, in which he was employed continuously for about 16 years. He fell in action on September 20th, 1917, aged 29 years. He was an ardent supporter of the (B.P.) Boy Scout movement, being mainly in training in founding the 1st Scout London (1st of Own) Troop, and their first Scoutmaster. He was of a quiet and unassuming disposition, and his loss is much regretted by all who knew him. In a letter to his relatives an officer of his unit comments on his bravery and on his popularity amongst his comrades.

ACTING-CAPTAIN and **ADJUTANT V. C. RUSSELL** (Suffolk Regiment), younger son of Mr. Stuart A. Russell, works manager of the India-Rubber Co., Silvertown, has been awarded the Military Cross. Early this year, Captain Russell (then Second Lieut.) was wounded for the second time. He had then been twice mentioned in dispatches. **PRIVATE A. E. HAFENDEN** (Lancashire Regiment), formerly in the general office of the same company, was killed in action on October 22nd. **PRIVATE E. T. S. MORRIS** (London Regiment), of the same department, has been gassed.

LIEUT. W. H. GOULDSTONE, R.F.C., who has been mentioned in dispatches by Sir Douglas Haig, was up to his enlistment in the Navy, early in 1915, on the staff of the electrical engineer at West Ham. He served in the Dardanelles, and in August, 1916, was transferred to the R.F.C. He was recently wounded, and is in hospital at Eaton Square, W.

SAPPER DONALD TEE, R.E., who was on the staff of the Chichester electric light works, has been killed whilst engaged under heavy fire repairing a communication wire.

CORPORAL H. P. ARNOLD, R.E., who was in the turbine works of the B.T.H. Co. at Rugby, has fallen in action.

PRIVATE FRANK CORNALL, King's Liverpool Regiment, who has been wounded in action, was employed at Blackpool electricity works.

FLIGHT SERGT. T. HAROLD AMES, R.F.C., has been gazetted Second Lieutenant. Enlisting early in 1915, he has seen active service in most of the air raids on the South-East Coast as gunner observer, being wounded during one. He was apprenticed to Mr. Thomas Barton, electrical engineer, Blackburn.

CITY NOTES.

Vera Cruz Electric Light, Power, and Traction Co., Ltd.

MR. V. W. YORKE, in addressing the annual meeting, referred to the difficulties that had arisen in preparing the accounts. The two years which they covered had been the most difficult in the company's history. The net results showed a loss of only £702. During the entire period the exchange value of the Mexican paper currency continued to depreciate, but negotiations with the State authorities for increasing the tariffs and the tramway fares compensated to some extent for exchange losses. During the year 1916 the net earnings were some \$12,500 higher than in 1915. It had not been possible to make any provision for depreciation of plant and machinery except for the operation of the first mortgage debenture sinking fund. There was a substantial figure to the credit of depreciation and general reserve account which had not been drawn on in any way. The company continued to receive its power from the hydro-electric plant of the Puebla Tramway, Light & Power Co., and except for intervals of short duration, when that company's transmission line had been out of service on account of the activity of rebels in the district, the supply had been continuous. In 1915 out of 6½ millions K.V.-hours consumed only 351,000 were generated by their own plant, and in 1916 out of practically the same consumption their own plant generated 115,000. The steam turbine plant, which was installed temporarily pending the completion of the Puebla Co.'s transmission line, had been disposed of on satisfactory terms. The company's property had been maintained in good condition, and many improvements had been made in the tramway tracks. New car barns, offices, and shops were in the course of construction, and many new ornamental posts for street lighting had been installed. Although the conditions of the country were by no means settled, the outlook for the current year was extremely satisfactory. All sections of the company's business showed improved results as compared with the year prior to the revolutionary disturbances. For the month of September this year, as compared with the corresponding month of the previous year, the total K.V.-hours delivered had increased 110 per cent., and the number of consumers of light had increased 110 per cent., and there was an increase in H.P. (in motors) connected of 52 per cent. In the tramways section the

number of passengers carried had increased 70 per cent. to upwards of half a million passengers per month. The total gross revenue in Mexico showed an increase of 94 per cent., and although expenses were necessarily higher on account of increased wages, additional taxation, &c., the net earnings showed a satisfactory increase of 65 per cent. He was not without hope that when the accounts for this year were completed it might be possible to recommend a resumption of dividends on the ordinary shares. There were now very few enterprises in Mexico which had not been compelled, through no fault of their own, to default on their obligations during recent years, while this company had not only met the interest and sinking fund on its debentures out of profits as it had fallen due, but might now, unless the unexpected happened, return to a dividend-paying basis.

Richardsons, Westgarth and Co., Ltd.

A reorganisation scheme is under discussion. A circular has been distributed among the shareholders by the managing director (Mr. D. B. Morison), in which he replies to what he describes as "unfair and misleading" statements made in another circular which had been issued by a stockbroker and a shipowner of West Hartlepool. In the course of his statement Mr. Morison refers to the Contrallo patents as follows:—"The Contrallo patents were offered in the first instance to the company, but in view of the great speculative cost of developing world patents and the special expert staff involved, the Board decided not to exercise their option, but to retain their preferential manufacturing rights. The inventions were then developed by Mr. Morison and a few friends, and subsequently the Contrallo Co. was formed. Upwards of £50,000 have been spent to date in proving the inventions and developing the business, no part of which has been contributed by Richardsons, Westgarth & Co. The business is now of such importance that an agreement for the joint manufacture of certain Contrallo apparatus has just been entered into between Vickers and Richardsons, Westgarth & Co. which, asserts Mr. Morison, is calculated to largely benefit both companies."

According to the *Financial Times*, the reconstruction scheme was rejected at a meeting of preference and ordinary shareholders on Friday last, and a committee of shareholders is to confer with the directors with a view to formulating a scheme that would be generally acceptable.

The scheme proposed the reduction of the capital to £717,500 by reducing the value of the preference shares to 14s., and that of the ordinary to 7s.

India-Rubber, Gutta-Percha and Telegraph Works Co., Ltd.

At the annual meeting, held on December 20th, Major LEONARD DARWIN, who presided, said that the net profits, after providing for doubtful debts and war contingencies reserve, amounted to £162,149, which had enabled them to restore another £50,000 to the reserve fund, which now stood at £150,000, the figure at which it stood before the first withdrawal in 1911. It was satisfactory to have entirely retrieved the losses made in 1911 and 1914. Regarding the £30,000 for an officers' and employees' staff fund, the question of instituting such a fund had been under the consideration of the board for some time, and it had also been in the minds of some of the shareholders. There was no doubt that after the war the necessity and usefulness of such a fund would become even more apparent and pressing, as doubtless there would be many cases arising as the result of the war which they were sure the shareholders would wish them to treat as generously as possible. To act thus would be impossible unless such a fund were now established. Hitherto the company had done nothing to provide such a fund for its employees, and considering the time the firm had been in existence, and the position which it held, they considered it most desirable that this omission should be rectified now that the opportunity had arisen. It was true that two of the past directors, Mr. Robert Gray and Mr. J. Y. Buchanan, had endowed a staff fund, which now amounted to over £9,000, but such a sum did not go far in the case of a firm which employed over 4,000 hands. Of course, the existence of this proposed fund would not constitute a claim for every employee, as such, to the proceeds of the fund. The directors, or the trustees whom they appointed to administer the funds, had entire discretion in its administration, for it would only be possible for a body thus constituted to obtain all the information necessary to ensure a wise distribution of benefits. The record of the year had been one of plentiful Government orders, and an equally plentiful supply of obstacles in the way of getting material and labour to execute them. The terrible explosion at Silvertown at the beginning of the year fortunately did little personal injury to their hands beyond a slight amount of damage from broken glass, &c., causing some interruption to work. They had made a claim against the Government in respect to this damage, and they hoped that it would shortly be liquidated. They heard last year of the loss of their remaining cable-ship, the *Dacia*. He stated then that the question of replacing her was engaging the attention of the board. To build a ship at the present time, when there were so many claims on the yards for tonnage, was, of course, out of the question. They might, no doubt, be able to purchase a ship of a kind not likely to be of much service for general freights, but which would

adequately fulfil their present requirements. Unfortunately, however, if they did so they would be left with a very costly ship on their hands for their future work in peace time. The foreign branches on the whole had done well, and Persan had made a good profit, in spite of the many difficulties in regard to labour and material, which were specially acute in France. All the company's available cash had been invested in War Loan and War Bonds, both of which were accepted in payment of Excess Profits Duty. They had lately been in correspondence with the Inland Revenue with regard to this duty on the profits on the year ended September 30th, 1916, and had accepted their assessment. As long as the war lasted they hoped to have plenty of Government work, but when Peace was declared an anxious period would be in store for all those firms who had lost much of their usual trade through the making of munitions. They had set aside a certain amount for those troublous days, but if, as might well happen, it should prove insufficient, they must hope that the Government would come to the assistance of themselves and other firms who had been put to disadvantage by the performance of national work. The extra profits from war work would assuredly have been sufficient to see them through all their future difficulties if they were not nearly all to be taken from them. He could not finish without again calling the attention of the shareholders to the excellent work done under most trying circumstances by their much depleted staff. They had done their utmost to meet the increased demand on their energy, and they had done this largely out of a spirit of patriotism.

**Edison Swan
Electric Co.,
Ltd.**

Mr. C. JERMYN FORD presided, on December 19th, at the annual meeting. He said that the new capital, consisting of £100,000 preference shares, was issued in June last, shortly before the date of the

balance sheet. Loans now stood at £14,000, against £27,000 at the date of the previous balance sheet. The reserve account now stood at £40,000, against £15,000 in the previous balance sheet, bringing it almost up to the same figure at which it stood four years ago, when the whole of the fund was applied in reduction of various assets then standing on the credit side of the balance sheet. They had expended £3,402 on new buildings, mainly in respect of additions to the lamp works, making them more efficient and capable of a considerably increased output, and they would possibly have to make a further considerable outlay on this part of the works. The item of "plant and machinery" had also increased by £7,500 for the same reason. Stocks had risen to the extent of £315,000, which was mainly due to the enhanced cost of raw materials, coupled with the increased price of labour upon that portion of this item which consisted of work in progress. Sundry debtors stood at £123,000, an increase of nearly £20,000, a large percentage of the total sum owing to them being in respect of Government contracts. With regard to the profit and loss account, at the first glance the results of the trading for the year might seem to be unsatisfactory, but during the past year the company had carried on its operations under probably the most disadvantageous circumstances which it could possibly have to face. It had been pointed out at every annual meeting at which he had presided, that the need of additional working capital was very seriously prejudicing the company's position, rendering it unable to take full advantage of any increased trading which it might obtain, and for the last few years the position had become steadily worse in this respect. During the year under review it arrived at its climax, therefore the earnings disclosed could not be a surprise to them. That portion of the new money brought in by the preference share issue, of which up to the date of the balance sheet they had received about £60,000, was not at their disposal until practically a few days before the close of the financial year, as the allotment of the shares did not take place until June 1st, and the balance sheet carried them to the 30th of that month. Under these circumstances, of course, they received no practical benefit from this money in the period; the only way it really benefited them was that they were able to clear off a very large amount of their outstanding indebtedness for goods supplied, &c., otherwise the item of sundry creditors would stand at a very much higher figure. This shortness of working capital had also affected them in two other ways; first, they had been unable to take full advantage of discounts on goods purchased, which they might otherwise have done had they been able to pay promptly for them, and he estimated that the losses under this head amounted to somewhere about £8,000; and secondly, they had not been able, for the same reason, to purchase these goods as advantageously as they might have done had they had the ready money to do so. Then the profits which would, under normal conditions, have been earned at the branches abroad, had been seriously affected by reason of the fact that it had been impossible to obtain shipping freights in order to keep these branches fully supplied with stock, and, whilst the current expenses abroad had increased, as everything had increased (a world-wide complaint), they had not been able to sell a correspondingly increased amount of goods, and, unfortunately, he did not think that this condition of affairs could possibly be remedied so long as the present difficulty of shipping goods continued. He told them last year that they had increased their operations in the Colonies, and that they were building up a good business there, but since then the ques-

tion of shipping freights had become far more difficult than one could have foreseen. The profit derived from the manufacture of electric lamps had also suffered, partly from the rise in the cost of labour and materials, and partly from the fact that a very large number of their old and skilled hands had left the works to take up the manufacture of munitions, and they had been forced to fill their positions with unskilled hands, whom they had had to train. This difficulty had for the moment been practically overcome, and the sale of lamps for the past six months had largely increased. The price of the lamp was only raised in May last, a month or two before the accounts closed, whereas during the whole period the costs of manufacture had increased by about 33 per cent., for the reasons before stated. Generally speaking, they had been manufacturing all classes of their products under very difficult conditions. They quoted prices based upon current rates of labour and raw materials, adding such a percentage as they were able to against the contingency of higher prices for labour and raw materials which might come into force before the contract was completed, but the constant demands of labour for increased wages and the incessant rise in the price of raw materials made it practically impossible to provide for all these contingencies when contracts were entered into, and the profits had suffered accordingly. In spite of the additional capital brought into the business by the preference issue, the cash position was far from being comfortable. Owing to war conditions and the heavy rise in all raw materials, a large amount of capital was required to run a business of this character, and, as their turnover had materially increased in recent months, they had to conserve their cash resources in every direction. The question of a small dividend payment on the ordinary shares was the subject of a good deal of discussion, and the board naturally were anxious to recommend one directly they could see their way to do so. Some might consider that, instead of carrying forward £13,266, they should apply a portion of this in the payment of a small dividend upon the "A" shares, but they must bear in mind that they still owed the bankers about £35,000, and it was incumbent upon them to reduce this as far as possible. Then they had over £7,000 to pay away shortly for munitions levy. On January 1st there was the interest upon the first debenture stock to be met, which amounted to about £7,700, and on February 1st there was the dividend upon the new preference shares, absorbing between £2,000 and £3,000. A dividend of only 2 per cent. upon the "A" shares would absorb £7,600, and therefore, under these circumstances, they had to go very closely into the cash position. They had suffered heavily during the last few years from the shortage of cash working capital, and now that they were getting into a better position it behoved them to be very careful that they did not run short again. For all these reasons they felt that, as regarded an immediate dividend, they must go a little slow, and they did not therefore see their way to recommend it at the present juncture. He trusted they would not consider that his was too gloomy a view of the position, but they must realise that all these facts, coupled with the great shortage of working capital which they had to face, made it impracticable for them to show better results. However, the new money had undoubtedly improved the position and earning capacity, and, with the very considerable increase in the output of lamps which they had now achieved, should make it possible for them, in the absence of unforeseen circumstances, to make a better showing for the current year. Practically the whole of the engineering side of the works had been, and was still, occupied with Government work. They had experienced a loss of profit of approximately £2,500 in consequence of having received no dividend in the past year on the holding of deferred shares in Altrincham Electric Supply. This concern suffered during the past year from the operations of the Daylight Saving Bill, and from general economies in use of current for domestic lighting purposes, and the high price of coal. He was glad to say, however, that this had now been to a great extent counter-balanced by some important contracts entered into for the supply of current for power purposes, and he was looking forward to far more satisfactory results for the current year. In regard to the question of the splitting of the existing £5 shares, which was fully set out in the scheme placed before them relating to the creation of the preference shares, an extraordinary general meeting would be held immediately following the meeting to sanction the cancellation of the remaining liability of £2 upon some of the partly-paid £5 shares, and should they pass the resolutions an application would be made to the Court at the earliest possible moment to obtain an order to confirm the reduction of capital, and at the same time the shares would be split into the denomination of £1 each.

Mr. E. B. ELLICE CLARK, in seconding the motion, said that with regard to the Munitions Levy of £7,266, the board considered it was not too strong a term to say it was an almost unjustifiable levy. The levy was based on pre-war profits, and as they knew, unfortunately for the company, for a few years before the war they were in low water, and made very small profits, and in one year they actually made a loss. The company voluntarily placed its resources at the service of the Government, which must interfere to some extent with its ordinary business, and they considered the levy was an exaction. They had to remember they were engaged in an industry which was of great service to the

country; whereas companies selling fripperies were making large profits, and were not called on to pay so much in view of the profits they were making before the war.

An extraordinary meeting followed, and the resolution dealing with the rearrangement of capital was carried.

Spanish & General Wireless Trust.—According to the *Morning Post*, Mr. Godfrey Isaacs presided at the annual general meeting held last week. He said that the Spanish business, in which they were very largely interested, was developing very satisfactorily, and a very substantial increase would be made to their producing powers in the early future. There was every reason to contemplate that the next twelve months would produce a very satisfactory balance sheet. In that case, there was reason to believe that it might be thought wise in Spain to declare a dividend. If this were done their Company—the Spanish and General—must benefit very substantially. The possibilities of business during the past year had been practically nil in consequence of the conditions which had prevailed. They did, however, continue some negotiations in Russia, where they considered a very substantial business would be done after the war, but in consequence of recent events the figures which related to their interest in this business stood in the balance sheet as “debtors and debit balances.” That particular business had not been formally completed, and he dare not, at the present moment, express any opinion as to when it would be completed, or as to what would happen in Russia.

Costa Rica Electric Light & Traction Co., Ltd.—For the year ended June 30th, 1917, the net earnings in Costa Rica, after charging all expenses incurred, amount to £14,381, a decrease of £1,830 on the year. The net deficit is £3,827. This unfavourable result is chiefly due to the serious depreciation of the Costa Rica currency, the “Colon” only representing at present half its nominal gold value.

As all supplies have to be paid for in gold, the rise in the rate of exchange has automatically increased the expenses. The greatly enhanced cost of all stores, caused by the war, has also contributed to the decreased profits of the undertaking. In spite of the general depression in Costa Rica resulting from the stoppage of exports and dislocation of trade, the volume of the company's business has been maintained to an unexpected degree, and, but for the rate of exchange, would, even in the past year, have yielded a surplus after providing for all expenses. The power plant at El Brazil has worked well throughout the year. During the year the gold premium has averaged 200 per cent., as against 140 per cent. for the previous year.

Blackpool, St. Anne's & Lytham Tramways Co., Ltd.—The annual meeting was held at Blackpool last week, Mr. Geo. Nicolson presiding. The directors reported that necessary repairs would be carried out when labour and materials were available, and provision had been made on this account. The traffic receipts were £59,028, less £16,066 paid to the Blackpool Corporation, making the net amount, £42,962, and other receipts brought the total to £44,421. After the payment of expenses, there was a credit balance of £11,287. The directors recommend a distribution of the full year's interest of 5 per cent. on the debenture stock. The renewals account amounts to £10,727. In congratulating the shareholders upon the successful year's working, the chairman mentioned that practically all their available staff had joined the Army, and the cars were now entirely conducted by women.

Mr. C. H. Moore seconded the motion, which was carried. Subsequently a resolution was passed authorising the directors to establish an officers' and employees' staff fund.

W. & T. Avery, Ltd.—Interim dividend on the ordinary shares of 5 per cent., less tax.

Marconi International Marine Communication Co., Ltd.—Interim dividend of 5 per cent., equal to 1s. per share, less income-tax.

STOCKS AND SHARES.

FRIDAY EVENING.

The Stock Exchange broke up for its Christmas holidays with considerable strength in all the markets. A buying movement started in Consols, spread to Home Railway Stocks, and made its influence felt in practically every department of the House. No particular reason developed for this change, but this did not make it in the least welcome, and the disappointing feature was the difficulty to get stock with which to supply the suddenly persistent buyers.

The Home Railway market has assumed a much brighter complexion as a consequence of quite a small demand for the coming issue. Apparently, a few investors have noticed that Home Railways return tempting yields at the present time, and, for the moment, that is to say, to discount some of the possibilities which may materialise after the war. Investment had not spread to the Undergrounds up to the time of the House dispersing for the Christmas holidays, but that it did so early in the New Year is tolerably certain, provided strength is maintained amongst the steam stocks.

Home electricity shares show no changes at all throughout the day, but there has been some inquiry for the manufacturing companies, and the early dullness in the group is shown

by British Aluminium ordinary, which went back to 32s., at which price a return on the money comes to just over 6½ per cent. The Iron and Steel divisions have started to rally, and an appreciable recovery set in amongst rubber shares, assisted by a rise in the price of the material to half-a-crown per lb.

Mexican Light & Power common shares have been marked down to 5 points at 17½, and the severe slump in other Mexican issues, to which we made detailed reference last week, has not been counteracted by any recovery, notwithstanding the fact that Mexican stocks and shares as a whole are a slightly better market, or, as it might be more correct to say, a slightly less weak one. British Columbia 4½ per cent. Debenture has fallen 2 points, and Brazil Traction weakened to 15½. The Anglo-Argentine Tramways stocks are dull on the announcement that the directors have decided to postpone the payment of a dividend on the First Preference, and the price of these shares has again fallen an eighth to 2½.

Globe Ordinary are better in the telegraph department, where other stocks maintain their prices well, although Great Northern lost the £1 which they put on last week, the price reacting to 36. Marconis have come into demand again, due principally to the declaration of an interim dividend of 5 per cent. on Marconi Marines. This had the effect of strengthening the price of the last named to 52s., while Americans rose to 24s., and Canadians to 11s. The telephone market throughout is firm.

Having regard to the shortage of time and paper, the brevity of the market report may possibly be excused this week. Which same brevity makes no difference to the cordiality of the wish, to those who have the patience to read these notes, that they may enjoy a Peaceful and Prosperous New Year.

* Dividends paid free of income-tax.

INSTALLATION "D": CONNECTED MARCH, 1915.
CLASS—STAFF FEEDING.

One double oven range, 13.3 kw. One 12-gallon boiling pan, 6 kw. One pudding steamer, 2 kw. One grill, 4 kw. One oval fish fryer, 2 kw. One 4-gallon urn, 3 kw. One hot cupboard, 2.5 kw.
Total loading of whole equipment, 32.8 kw.

The following table shows the details of consumption, cost of maintenance, &c., on the installations referred to:—

Installation.	Period of observation.	Consumption in units.	Average number of meals per week.				Cost of maintenance per 1,000 units consumed.	kw. connected.	Remarks.
			Breakfasts.	Lunches.	Teas.	Total.			
"A"	10 months	122,052	389	5,186	3,943	9,518	1s. 6½d.	247.6	
"B"	1 year	97,140	204	1,480	1,270	2,944	2s. 9d.	130.9	
"C"	1 year	21,141	211	452	328	991	2s. 9½d.	40.5	
"D"	1 year	20,690	48	371	221	640	4s. 6½d.	32.8	See below.

Remarks.—"A." In addition to the figures of meals, there is a weekly average of 600 Bovril and hot drinks. The list

FIG. 7.—DINING ROOM SERVERY, INSTALLATION "A."

of the quantity of food cooked is a weekly average. From tests taken, the consumption of energy per person served, including staff, is 0.29 unit per meal.

"B." The list of the quantity of food cooked and consumed on an average day gives a good indication of the nature of the work performed. There are, however, several items carried out by the apparatus which do not come under the heading of cooking for the staff. The estimated consumption of electricity per person is 0.5 unit per meal.

"C." No list of food cooked has been obtained from this installation, but the consumption of electricity per person per meal is 0.41 unit.

"D." In addition to the number of meals provided, there is a weekly average of 16 Bovril and hot milks, and 50 lb. of bread baked and nine suppers. There are also occasions when large quantities of food are cooked and consumed at other places, a list of which is given. The consumption of electricity per person catered for is 0.51 unit. The cost of maintenance on this installation is high because during the last 18 months the apparatus has been catering for 100 per cent. more people than originally intended.

In conjunction with these figures, one must also consider the advantages of electrical cooking, from the economy of labour and food, simplicity of operation, the less fire risk, the saving on utensils, cleanliness, and the less floor space required as compared with coal, gas, or steam.

The details of operation of the supplementary plant at installation "B" are not included in this analysis, or in the part showing the nature of the load, as they are used mostly for warming up food.

In the analysis, all elements, &c., that have been supplied free under guarantee have been included at their ordinary costs. Workmen's time has been omitted in order to make a true comparison with these installations close to the workshop.

MAINTENANCE ANALYSIS OF INSTALLATIONS "A," "B," "C," AND "D."

		Hot-plate.	Grill.	Urn.	Hot cupboard.	Fish fryer.			
"A"	4	2	7	—	—	—	—	17	4
"B"	20	16	25	5	2	3	7	27	25
"C"	—	22	1	1	—	—	—	14	3
"D"	2	28	28	—	—	—	—	17	2

Average quantity of food cooked and consumed at installation "A" per week:—

1,362 lb. of roast meat, 140 birds (average weight 3 lb. each), 282 grills, 300 lb. of sausages, 35 gals. of soup, 2,162 portions of fish, 140 lb. of Yorkshire pudding, 2,940 lb. of potatoes, 10½ pecks of peas, 63 cabbages, 84 lb. of turnips, 56 lb. of carrots, 56 lb. of milk pudding (in dry state), 884 portions of ham and eggs on toast, 1,150 cups of coffee, 15 gals. of water boiled from 150 deg. F., 1,265 portions of hot sweets, 112 lb. of scones, 42 lb. of pastry.

Average quantity of food cooked and consumed at installation "B" per day:—

73½ lb. of roast beef, 34 lb. of haricot mutton, 10 gals. of potato soup, 21 lb. of peas boiled, 10 lb. of beans boiled, 112 lb. of potatoes, ¼ gal. of vegetable stock, 6 gals. milk pudding, 1 gal. of hot milk, 2 hams boiled (28 lb.), 80 eggs fried and poached, 1 side of bacon (grilled and fried), 100 gals. of water boiled from cold, 22 lb. of chops grilled, 67 slices of toast, 10 gals. of coffee, 2 lb. of Quaker oats.

Average monthly list of food prepared on the apparatus at installation "D" and consumed at other places:—

218 lb. of boiled beef, 98 lb. of roast beef, 77 lb. of boiled ham, 230 lb. of bread, 50 gals. of water boiled from cold, 50 teas, 21 lb. of beetroot, 16 lb. of cake.

A comparison of the initial costs of installations "A" and "B" with electrical apparatus, gas apparatus, and a mixture of coal, gas, and steam apparatus, is given in the following table

FIG. 8.—SMOKE ROOM SERVERY, INSTALLATION "A."

(the cost of connecting up the apparatus to the source of supply is in each case included):—

Installation.	Electricity.			Gas.			Coal, gas and steam.		
	£	s.	d.	£	s.	d.	£	s.	d.
"A"	1,116	19	0	1,169	0	0	1,275	0	0
"B"	566	6	0	488	0	0	536	0	0
"C"	108	12	0	98	10	0	—	—	—
"D"	111	12	6	104	8	0	—	—	—

In the case of gas apparatus, the warming cabinets and portable fish fryers in installation "A" have been omitted.

as it was impossible to obtain prices for them. It is doubtful, however, if they could be supplied for gas heating. In the case of the coal, gas, and steam apparatus at the same installation, oven roasting, pastry baking, and grilling would be carried out by coal or coke (with the exception of the grills in the serveries, which would be done by gas); the hot cupboards and steamers by steam, and the remainder of the apparatus would be heated by gas.

On installation "B," under coal, gas, and steam apparatus, coal or coke would be used for the treble oven range and grilling, gas for the cabinet roaster and fish fryers, and the

FIG. 9.—CAFE SERVERY, INSTALLATION "A."

remainder of the apparatus would be heated by steam.

The author is indebted to the Falkirk Iron Co., Ltd., for supplying the prices of the apparatus for coal, gas, and steam.

The difference in the initial cost is not so much with an installation of coal, gas, and steam, as with gas alone, but it would be impossible to use gas apparatus only on installation "A," for instance, owing to the restricted space. The first cost is not the only cost to be considered, and should never be looked upon as the predominant factor.

When the working comparisons are considered, electricity has the advantage in almost every detail, the following being a few of the essential items which in the majority of cases when carefully gone into offer sufficient advantages to outweigh any difference in capital cost:—

1. Cleanliness and absence of fumes.
2. Constant heating value, also the facility of reducing the heat to a definite degree, which is impossible with either coal, gas, or steam.
3. Reduced labour costs as compared with coal or steam.
4. Less floor space required, owing to the fact that electrical apparatus can be installed in almost any position, and in some cases mounted on tables or one above the other. Less floor space means less rent.
5. Economy in food, owing to less shrinkage of meat and less waste of food.
6. Saving on the renewal of kitchen utensils.

There are many other incidental advantages, but the above are in themselves sufficient to justify the installation of electrical apparatus.

Fig. 6 shows the lay-out of a canteen kitchen designed and in course of construction by the author. It will be observed that arrangements have been made to carry out efficiently the preparation of food for cooking by the use of auxiliary plant—meat and vegetable choppers, potato peelers, &c. The kitchen is situated between the dining rooms, the plant being designed to supply the cooked food for 1,500 persons at one sitting. Special attention has been given to ensure quick service, and the washing-up arrangements are such that plates, &c., are cleaned with a minimum of handling. The total load connected is approximately 350 kw.

The charts reproduced in fig. 10 show the nature of the loads on the respective installations, the lower chart being a summation of the other four.

These charts of supply should be of special interest to central-station engineers, as they indicate how similar installations will affect the load on their stations and networks. They also form a guide as to what one may expect in the future when the majority of large kitchens are run by electricity. In the author's opinion this is only a question of time.

It is, of course, assumed that the central-station engineer, or the sales engineer, has a thorough knowledge of cooking apparatus and their performances before he starts his campaign; if not, either the services of an expert must be secured, or any attempt to increase the cooking load must be

postponed until he has mastered the subject. The best way of buying his experience—and it can only be bought—is to erect a trial installation where he can closely watch its behaviour; by so doing he is getting his information first hand, from which he can lay his plans for future developments. If those engineers who have not yet attempted the large cooking business will look around their districts, they will be surprised to see the enormous amount of revenue that awaits them from large staff-feeding establishments, cafés, restaurants, &c., which will fully justify the first trial installation.

DISCUSSION AT LEEDS.

The paper was discussed by the YORKSHIRE LOCAL SECTION on December 18th. Mr. GILLOTT reiterated his remarks in London as to the necessity of co-operation between the central-station authorities and manufacturers, and the formation of an advisory committee, subsidised by both parties, to prepare campaigns, conduct demonstrations, and draw up schemes for submission to clients under expert guidance.

Mr. J. SHEPHERD, opening the discussion, said that, speaking merely as an engineer, and one who did not know much about kitchens, he thought that, whilst electricity was eminently suitable for cooking operations in small kitchens, some of the applications which had been illustrated as having been made in large kitchens were not so suitable for electrical operations as for steam. He did not think that the heating of very large hot-plates or cupboards, or the boiling of large quantities of water, or the making of large stews could be done as economically by electricity as by steam. Whilst this was not of consequence in the small kitchen, it was of considerable moment in the large kitchen.

Mr. T. ROLES said the illustrations indicated that wonderful strides had been made in electrical cooking during the last few years. He agreed that it was very necessary that there should be co-operation between the supply companies and the manufacturers, and thought that the municipal engineer

FIG. 10.—LOAD CURVES, AT 240 VOLTS.

should also be included. An important difficulty to get over still was that of overcoming the objection that electrical apparatus cost so much more than the other apparatus for cooking purposes. He thought that the author was quite right in saying that the services should be run in duplicate, with a separate switch and fuse for each piece of apparatus. Domestic cooking had suffered very much in the past from the

fact that a whole range had only one fuse. He thought that the difference between an installation for a restaurant and that for a staff-feeding establishment, which the author had emphasised, was important, and that it was very necessary that the actual requirements should be ascertained very precisely before the installation was put down. It would be extremely interesting if they could get to know how the load curve of cooking affected the general load curve.

Mr. W. M. SELVEY said he thought this question of the cooking load might turn out to be one of the most important matters that the supply engineer had to consider. The important thing for the engineer was to know whether the cooking load would dovetail in with the rest of the load or whether it would be overlapping and merely intensifying the peak load.

Mr. C. E. ALLSOP spoke of the importance of a sufficiency of hot-cupboard space in the restaurant installation. He asked for the author's opinion on the thermometer in the use of ovens, the question of indicating lamps, the matter of pin-contacts, and the degree of pressure which was advisable.

Mr. H. W. WALKER said he thought that, in cooking installations, hardly enough attention had been paid to the matter of ventilation. He had failed to satisfy himself as to the amount of economy achieved by electrical cooking in regard to the shrinkage in meat.

Mr. W. B. WOODHOUSE said he had not the slightest doubt that, owing to the diversified apparatus now in operation, electric cooking was a sound commercial proposition, and compared very favourably with gas or steam. Steam heating might be very good if there was a steady use of it, but the load curves shown indicated that the cooking demand was very far from constant, and for the greater part of the day there would be a heavy loss in the steam. The tendency now, he thought, was for the lighting load in electricity supply to become relatively unimportant. There were cases in which the lighting load was less than 5 per cent. of the total.

Mr. GILLOTT, in reply, said he thought Mr. Woodhouse had answered the point in regard to steam. A good deal depended on whether or not steam was there already for another purpose. Undoubtedly the electrical was the cheaper form of apparatus for large kitchens in regard to maintenance costs. The running costs of gas were higher than those of electricity. An important matter in putting in an installation was to know with as much exactness as possible what it was required for. If in such matters engineers could not secure the services of an expert they should be guided by the chef. In regard to the relationship of the cooking-load curve to the general-load curve, they found in Newcastle that the cooking load came on just when it was wanted, and it served to fill the gaps. The cooking load was going to be a very big thing, and those engineers who did not look after it were going to lose money materially. Wiring troubles were getting much less than they used to be, but they were not yet down quite as low as he would like them to be. He did not approve of the use of thermometers, but got better results by teaching people how to use the apparatus. He mentioned an important case in which the instruction of a lady demonstrator had the effect of reducing the electricity consumption by 33 per cent. He thought that the best indicating lamp was an ordinary 8-c.p. lamp. Pin contacts he had discarded five years ago for reasons which he described. As to voltage, he thought the best results were got from a low voltage. In regard to ventilation, if there was too much of it the advantage of low shrinkage of meat food was liable to be lost. He had carried out tests showing as low a shrinkage in meat as 5 per cent., but he did not claim better than 15 or 20 per cent. in speaking to customers. In the most conclusive way, by tests of which he gave full details, it had been proved that the shrinkage in weight of meat was less in the case of electrical cooking than in that of any other process, and that the yield of fat—which was so valuable nowadays that in one notable case on record the yield of the sale of it more than paid the cost of the electricity used—was larger by the use of electricity in cooking than by any other process.
